"In the Kaihum hills, which were first explored by Russians, there are copper and coal. About 60 miles north of Mount Lake I found oil. I crossed and examined fifty-two streams and rivers and panned gold in all of them. I found many small nuggets, some of them weighing as much as five carats. I took gold out of the Katrin hills, where no other white man has ever visited. That point is about 230 miles north of Cook's inlet and probably 600 miles north of the Klondike field. But all my explorations showed low-grade values. The Klondike placers are undoubtely rich in spots, but they will be found to be a great exception. On Porcupine river I found flour gold and some small nuggets. Along the exposed ledges I made many careful analyses, but always to find low values.

"The dip rock varies greatly—from 11° to 7°. Some quartz fissures I noted and they were all knifeblade seams. There were tremendous ledges, however, that would be very profitable workings for big mills, backed by an abundance of capital."

UTAH.

The Mercur *Mercury* says the underground force at the Golden Gate is being added to steadily and will continue to be increased until 130 miners are on the pay-roll.

A Frisco report to the Salt Lake *Tribune* states that in the bottom of the shaft being sunk on the Kate Sackett claim, the property of the Beaver Lake Copper Mining Company, a vein is being cut that carries large quantities of black sulphurets of silver, estimated to carry 700 or 800 ounces silver.

(Special Correspondence).—By reason of the price of lead keeping up the Bingham district is doing what may be considered fairly well under existing conditions. In general terms the camp is one of silver and lead, but in many of the mines the lead is such a predominating element that the discouraging slump in silver is not as severely felt as in other places which might be named.

But the fact that a first-class gold property is being developed and equipped in Bingham district, and that a well-defined, valuable copper ledge has been uncovered on the same property, shows that the precious metals are oftentimes more equally distributed than many suppose is the case. I refer to the Highland Boy property in Carr's gulch, near Bingham. Here is a property developed by several tunnels, connected by drifts and winzes, carrying silicious ores, running in values from $10 to $12 per ton in gold. These are oxydized and will be milled on the ground. In other portions of the property are large bodies of sulphide of copper ores, which must be smelted. The Highland Boy mill is practically complete and will be in operation prior to September 1. It is a combination mill, panamalgamation and cyanide, having a total capacity of 250 tons per day. All the ores are to be crushed to an 8-mesh. The coarser material will be cyanided and the finer passed through the pans and settlers. There are 10 leaching vats, 22 feet in diameter, 10 feet deep, six pans and three settlers. The mill was equipped without regard for the treatment of the copper ores, but the copper ledge is showing up so well that the problem of extracting the copper therefrom will be soon taken up.

The Old Jordan and Galena, whose pyritic ores carry good values in silver, lead and gold, is steadily operating with a concentrating mill, the tonnage being about 60 per day. Near the surface these ores were oxydized, but now it is purely a concentrating proposition.

The Spanish cyanide mill is treating about 40 tons of ore per day of medium values.

The Rogers mill and the North Last Chance are operating as usual, as is also the Winnemuck mine near town. J. G. Forrester, who formerly had charge of the Bullion-Beck mill at Eureka, has charge of the Winnemuck.

Bingham, Utah, Aug. 7, '97. WASCOTT.

IDAHO.

Lemp & Falk, of Boise, have bought the Star mine, at sheriff's sale, in Hailey, for $45,000.

The cyanide works at Camas No. 2 are about completed.

A contract has been signed for three sixty-ton barges for the Snake river-Seven Devils trade. One seventy-five ton capacity smelter now at Huntington will be put up immediately on the river, eighteen miles down the grade from the ore mines. Placers are paying better than ever since '68.

At Salmon, Idaho, on the 16th, all of the Yellow Jacket Gold Mining Company's property—consisting of a 50-stamp mill, forty-seven mining claims and other property—was sold at sheriff's sale, under an execution from the district court, to J. S. McChestney of New York, the judgment creditor, for $175,000.

MONTANA.

Butte *Miner*: The Boston & Montana Company has given a contract for replacing the iron pipes at the 1200 level of the Mountain View mine with others with a wood finish on the inside. The copper water in this mine for some reason has lately become so strong that it eats up any sort of metal pipes in a manner that is astounding, and has caused the management of the company a good deal of concern. The water from this mine will be precipitated, and it is expected that a good percentage of copper will be saved.

The cyanide plant at Pony is ready for work. The process will be under the supervision of Morris & Field.

Wetzstein & Eisenberg of Livingston have taken a six-months' lease and bond on the Gold Ring. The bond is for $150,000; $2000 down.

The drop in the market value of silver is a matter of consequence to the great Anaconda mines, whose output of this metal last year amounted to 5,433,826 ounces. Comparing the commercial value of silver to-day, which is 55½, with that of a year ago, when it was 68½, it is seen that the shrinkage in price on the Anaconda's production of argentiferous product alone, quality equal to that for 1896, would be $706,397. This is equal to fully 6-16 of 1 cent per pound on 125,000,000 pounds of copper.

The Anaconda has been getting out a very large copper product lately, that for May being about 12,262,000 pounds. It is necessary to produce heavily in order to pay its 10 per cent dividends on capital stock of $30,000,000. The whole plant and equipment, as it now stands, is fitted and arranged for an enormous production, and no curtailment in output should be expected. As it has depended on the silver and gold from its mines to furnish the bulk, if not all, of its profits, with the decline in bullion value of silver, the Anaconda would have to produce 1,250,000 ounces more silver than it did last year, with the market price 55½c, to obtain an income equal to that on its 1897 output of silver. Every cent that silver declines in price means a loss to the Anaconda of $54,338 on basis of last year's output. During 1896 the Anaconda produced nearly one-third of all the silver produced in the State of Montana. It would require very nearly the entire silver output, at present prices of bullion, to pay the Anaconda's dividends of $3,000,000 per annum. Both the argentiferous and auriferous yield of the Anaconda were somewhat less in 1896 than in 1895, notwithstanding an increase of over 25,000,000 pounds in the copper output.

E. Berthmet of France has purchased the Lexington Company's property, a mile north of Buttee, for $50,000. The Lexington was once owned by A. J. Davis. He bought it for $20 and a horse, but, not having any particular use for it, he sold it to the Lexington Company for $1,000,000. The property has not been worked on an extensive scale since the drop in silver.

The Gold Dredging Company, at Bannack, made a shipment of gold to the Helena assay office last week valued at $18,000, representing two weeks' work.

At Libby the Silver Cable Company has finished hauling 150 tons of machinery for their concentrator on Silver Cable group. They will handle about seventy tons of ore and ship daily one car of concentrates.

At Gaylord, on the Jefferson river, the Parrott Silver & Copper Company of Butte are erecting a smelter plant, expending $1,000,000. They have built a ditch eighteen miles long.

COLORADO.

W. S. Stratton is contemplating the erection of a 100-stamp cyanide plant on the top of Globe hill to handle low grade ores from his properties on the hill.

At the Isabella, Manager Freeland has been engaged mostly in dead work. The three-compartment shaft has been sunk 600 feet, in all the levels from the old incline shaft drifts and crosscuts driven and to connect with it; bodies of ore has been blocked out.

The statement of the Pharmacist Company for the quarter ending July shows receipts $15,000, disbursements $16,148, including payment of $4,000 on notes.

At Cripple Creek the July output from the Anchoria-Leland was 775 tons, all going to the smelters. Much dead work is being done. None of the milling grades are being broken in the mine. It is understood that the Anchoria-Leland mill will soon be built at Colorado City in connection with the electric railway from Colorado Springs to Cripple Creek to be built as the main stem of the Cripple Creek district road now under construction.

At Yankee a contract has been let to entirely overhaul the Alice mill and increase its capacity to 250 tons of ore daily. The mill will be remodeled on the principle of the Mayflower mill at Idaho Springs, as that has given the best results of any mill in which the ore of the Alice mine has been tested. A large air compressor is also to be erected at the mouth of the tunnel and a number of air drills will be used in breaking ore.

The Alice vein is probably the largest in the State, the ore body being 310 feet in width, and has been uncovered a distance of 800 feet in length, beyond which point it has never been prospected. So far the property has been worked by a series of tunnels run in different directions and from a pit resembling a large stone quarry.

The Holy Cross Gold Mining & Milling Company, operating at Holy Cross, during the past year has driven a drainage and development tunnel 1,600 feet in length and erected and put in operation a cyanide mill of a daily capacity of 75 tons.

At Ouray, F. W. Bushman of the Sky Rocket mine, arranged with the Fowler smelter to supply his plant with pyritic ore enough to keep it in operation constantly. The Sky Rocket contains apparently an unlimited body of pyritic iron, just what the smelter needs. The smelter people are to mine it themselves, and perhaps pay a nominal price for the ore. It will help the smelter out and develop the Sky Rocket mine.

NEW MEXICO.

Hornbeck & Osberg will erect a 100-ton chlorination plant within ninety days at their mines, three miles northwest of Elizabethtown.

The Gold Nugget Company of Wichita, Kan., has twenty-two acres of placers in Big Nigger gulch, where hydraulic operations will commence next week under the management of J. T. Bellow.

The Mesa del Oro Company, L. B. Tully superintendent, A. M. Dobbie engineer, will work the Hillsboro placers on a large scale never attempted before. The area includes 1,500 acres. The *New Mexican* says: The prospect shows between 60 cents and 80 cents a cubic yard in gold. A part of the work will be a ditch 20 miles from the Rio Animas to Animas Peak; the construction of a pipe line 2,600 feet spanning the Animas, and an extension of this pipe line 1,900 feet crossing a canyon. The ditch will be 4 feet wide at the bottom and 7 feet at the top and will be 3 feet deep, capacity 2,000 miners' inches per second; fall will be 10 to 1½ feet to the mile. The water to be used in washing the placers will come from a dam on the Animas. The estimated dimensions follow: Three hundred and thirty feet on the bottom, 8 feet on the top, and 100 feet in height. The estimated cost of fitting up the placers and putting every thing in readiness for operation is about $500,000. The company's principal place of business will be at Hillsboro. Surveys are now under way.

TAOS COUNTY.

Sixteen claims were located and filed upon in the Red River district in the last ten days of July.

A strike has been made on Red river about six miles below the town of Red River. It is said the vein will run about 300 ounces of silver to the ton.

The Climax at La Belle is shipping ore. In the drift a distance of 75 feet from the surface the vein is about 3 feet wide, all milling ore, accompanied by a pay streak about 9 inches wide that runs $120 in gold.

In Cabresto canyon, eight miles northwest of Red River, a tunnel is being driven into an abandoned working of the Spaniards. The fill-in has been cleared out for 110 feet, and the tunnel at that point dips at an angle of 25°. The loose dirt and gravel assay $27 to the ton, and occasionally pieces of ore are found which run $300 to the ton.

GRANT COUNTY.

The Driscoll Company has twenty men at work on the Carrasco dump in the Santa Rita district, and is shipping the product to Silver City.

Twenty-five men are working on the old Hanover mine for N. S. Berray. At water level a large body of 16 per cent copper ore has been struck.

About forty men are at work in the Confidence mine, in the Mogollon district. The company's mill started up two weeks ago.

Thirty-five men are at work on the Gilchrist lead, Guadalupe Oxide, and Clineo mines in the Santa Rita mountains, producing about 200 tons of high-grade copper ore per month, which is shipped to the Silver City reduction works for treatment.

Mrs. Hearst, who recently purchased the Pacific group of claims at Pinos Altos, is making many improvements on the property. The shaft on the B. & S. is down 100 feet below the old workings.

SIERRA COUNTY.

The July shipments from the Snake mine lease amounted to seventy-five tons, mostly over four ounces of gold and none under three ounces per ton.

ARIZONA.

The eleven copper claims of E. Hughes, in the Santa Ritas, three miles from Rosemont, are bonded to Denver men for $30,000. Work on the property is to be commenced within thirty days. At the expiration of ninety days $15,000 is to be paid and the remaining $15,000 is to be paid within ninety days thereafter.

At the Congress Gold Mining Company the cyanide plant handles 100 tons daily, producing about $600 per day. The capacity is to be increased to eighty stamps during the year. W. F. Staunton is superintendent.

The Yarnell 20-stamp mill, thirty miles east of the junction, will soon renew operations under a new contract. At Stanton a 10-stamp mill is expected to begin by September 1st. Fool's Gulch is closed up as a camp. There is some work being done at the Harqua Hala district, sixty miles southwest of Congress.

The White Hills mill last week shipped 800 pounds of bullion to Denver by express. The July output of the 10-stamp mill was $15,000.

The Arizona Onyx Company has been incorporated at Phœnix, capital stock $1,000,000, principal place of business Jersey City, N. J. T. J. Norris of Prescott is agent. The corporation was formed for the mining and manufacture of onyx.

General Agent Helm of the Denver & Rio Grande says the Phœnix & Globe Railroad will extend ninety miles. The work is to be done by the Santa Fe, Prescott & Phœnix road, at the present time operating a line running from Ash Fork to Phœnix, a distance of 196 miles. Construction will begin in a few weeks.

J. B. Young of Pasadena, Cal., has sued the Volcanic Copper Mining and Smelting Company of Arizona for $49,000 worth of their bonds. He alleges that he was offered $149,500 worth of the company's bonds to erect smelting works for them, he to receive all that was left after paying for the works. He made a contract by which the works were to be erected for $100,000, and asserts that the mining company failed to keep its promises.

AUSTRALIA.

The gold yield of Victoria for the last half-year was distributed among the following districts: Ararat, 12,300 ounces; Ballarat, 85,500 ounces; Beechworth, 54,900 ounces; Castlemaine, 25,900 ounces; Gippsland, 54,800 ounces; Maryborough, 28,600 ounces; Bendigo, 91,000 ounces; 4400 ounces, unspecified; total, 349,400 ounces.

The Broken Hill Proprietary half-yearly statements show a profit for the six months ending May 31st last of £147,000. The net assets amount to £602,000, and the profit and loss account shows a credit balance of £630,000. The average price obtained during the half-year for lead was £11 11s 3d per ton, and for fine silver 2s 7¼d per ounce. About 206,000 tons of ore were treated of an average assay of 17½ ounces silver and 8½ per cent lead. It is proposed to pay dividends quarterly on and after January next. The concentrating plant is expected to be started in three months. Acting upon the general manager's recommendation, the board have determined to take steps to purchase West Australian gold ores for the purpose of treating same. Such an operation would appear to be profitable, and the present existing plants are sufficient for the purpose.

NICARAGUA.

The Nicaraguan Government has suggested to Congress the enactment of an export duty on gold of $1 an ounce when from quartz, and of $1.50 when from placer mines, with a penalty of forfeiture of twenty times the amount of the duty and the loss, in certain contingencies, of the mining titles.

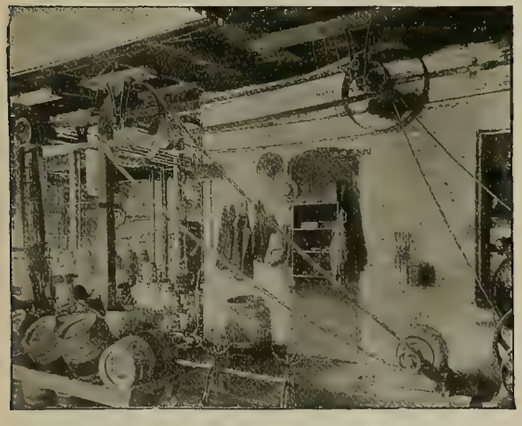
Electrical Progress.

Electric Installations at Sacramento.

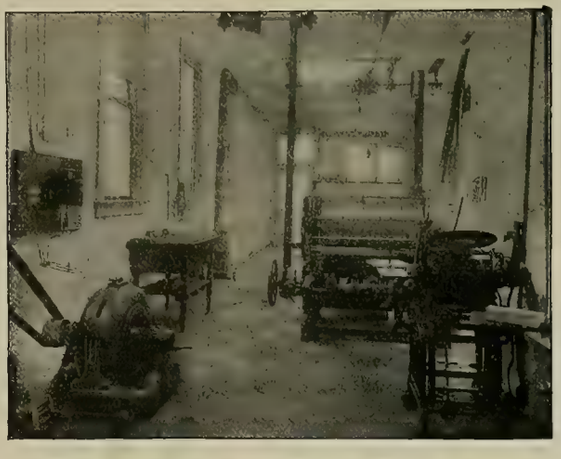
Since the introduction of the electric current generated at Folsom, twenty-four miles away, electricity is now used in Sacramento to drive machinery of all kinds, and is entering largely into what may be called the household life of the city. One of the most important motor installations is that driving the machinery in the shops of the Southern Pacific Railway Company. The Buffalo Brewing Company of Sacramento has recently installed motors, its present equipment consisting of one 5 H. P., one 10 H. P., one 20 H. P. and two 30 H. P. motors. They are all of the General Electric Company's three-phase induction type, without brushes, collector rings or moving contacts, and run almost without attention beyond an occasional oiling. They are driven by 200-volt current supplied from the 1000-volt circuit running from the sub-station a distance of two miles, the pressure being transformed down at the brewery. The smallest motor is used in the bottle-washing house; that of 10 H. P. in the keg-washing department. The three others are used to operate the blowers, the malting house and the machine shops. The large ammonia pumps in the brewery will also shortly be driven by electric motors. The printing presses of Day & Joy, in Sacramento, are also driven by motor. In this case the motor is of similar type to those in the brewery, but of 10 H. P. capacity. It was one of the first in the city to take current of the long-distance transmission. In installing the Buffalo Brewing Company motors, the question of the probable economy of the change was naturally uppermost. The guarantee was that electricity would show a saving of 40 cent. After the motors had been running for some time a series of tests were made, with the result that the saving, instead of 40 per cent, was shown to be a little over 50 per cent. Results almost similar have been obtained in other installations in Sacramento. It is hardly a matter of surprise that, with such showings to do missionary work, the use of electricity is rapidly extending in that city.

BUFFALO BREWING COMPANY'S BREWERY.

FIVE H. P., G. E. INDUCTION MOTOR IN BOTTLE WASHING HOUSE.



TEN H. P., G. E. INDUCTION MOTOR IN KEG WASHING DEPARTMENT.



TEN H. P., G. E. INDUCTION MOTOR IN THE PRINTING ESTABLISHMENT OF DAY & JOY.

Electro-Chemistry at Niagara.

Interesting developments in the electro-chemical line go on at Niagara Falls. Electro-chemistry, or properly electrolysis, was until recently a comparatively little understood science. The greatest development has been made in Germany and France, and to-day large plants are profitably operated in those countries making a number of chemicals entirely by electrolysis. As one of the main expenses in electrical processes is the power, those plants which generate their electricity from a waterfall have proved financially the most successful. To-day the city of Niagara Falls has more factories making chemicals by electricity than any other city in the world, says Frederick Overbury, in *Cassier's*. One of the several new works of this kind located there is that manufacturing chlorate of potash. The uses of this product are constantly increasing. From five to six million pounds of potash are imported annually into the States. A large part of this amount is used in calico dyeing as an oxidizer. It is also used in making parlor matches, blasting powder and some of the smokeless powders. Medicinally it is taken, in the shape of pellets, for various ailments.

The company's plant is the first one to manufacture chlorate of potash in the United States, and it thus marks the advent of a new industry there. The first step in the process consists in dissolving in large wooden tanks, from 10 to 12 feet in diameter and 6 feet high, chloride of potash, commonly called muriate of potash. This salt is found in large quantities at Stassfurt, in Germany. The solution from the dissolvers is pumped to storage tanks on the second floor, and from them led through pipes by gravity to the electrolyzing tanks. These are made of cast iron, porcelain-lined, 8 feet long, 4 feet wide, divided by porous partitions into positive and negative compartments. The cells rest on pipe standards and insulated from the floor.

The chloride solution is kept circulating through the cells from the positive to the negative compartments, and is electrolyzed in its passage, evolving chlorine gas at the positive pole and forming caustic potash at the negative pole. The chlorine gas is led under pressure from the positive into the negative compartment, where it combines with the caustic potash, forming hypochlorite and chloride of potash. There is considerable rise in the temperature of the solution during the operation, and the heat thus formed changes the unstable hypochlorite into chlorate and chloride of potash. These chemical changes are very rapid and continuous, the arrangement of the cells requiring very little attention from the men in this part of the work. By suitable pipes the solution of chlorate and chloride of potash is led to the floor below, to large porcelain-lined iron tanks containing lead steam coils, and is there evaporated down to the concentration point of chloride of potash when cold. From these tanks the concentrated liquor is run, boiling hot, into lead-lined wooden tanks, where it is left to slowly cool. Any disturbance of the liquor at this period of the process results in breaking up the crystals into minute particles, and hence great care is taken to keep it perfectly quiet. As the liquid slowly cools off, the chlorate crystals can be seen forming in square, flat shapes of different sizes. Very little of the chloride of potash in the solution is crystallized with the chlorate, as the two salts form at different densities.

After the crystals have all dropped to the bottom of the tanks, the mother liquor is pumped back to the storage tanks to be used over again in the cells. The chlorate crystals are gathered up with long wooden rakes and conveyed to a centrifugal dryer. The moisture is here driven off and any chloride present is dissolved by spraying water into the dryer while in motion. After this operation the crystals are loaded into a car and transferred to the dryroom, where they are spread on shelves to more thoroughly dry before packing. This is the last operation in the process. The chlorite crystals are put up in kegs holding 100 pounds. The electrical processes differ from the old methods only in the chemical part of the work; the crystallizing and drying are practically the same.

Soon it may be possible to dissipate thick fog by a charge of electricity, and the atmosphere of smoky cities can thus be kept clear and bright. A modification of the principle has already been applied by Oliver Lodge, who precipitated both smoke and dust on the walls inside a chimney or flue by static electricity. A patent has been taken out in Germany for an apparatus for smoke prevention by means of wires stretched inside a flue or chimney, and rendered incandescent by an electric current. There is no doubt that this extremely simple electrical method will completely consume the blackest smoke possible, but it is at the present time too costly to be commercially profitable.

Mechanical Progress.

Manganese Bronze.

In much of the manganese bronze used by foundrymen the manganese is added in the shape of ferro-manganese, which necessarily introduces considerable iron into the bronze; this is injurious; the bronze so made is more readily corroded and not so strong, tough, and ductile as bronze that does not contain iron. A rich alloy of manganese and copper, containing no iron or other impurities, is now on the market, and by using this alloy a very pure manganese bronze of any desired grade can be produced. One of the best and cheapest bronzes can be made after the following formula:

	Per Cent.
Copper	53.00
Zinc	42.00
Manganese	3.75
Aluminum	1.25

This makes a strong, tough metal, suitable for propeller wheels, gears, and pinions, mining machinery, etc. As the bronze contains no iron, a much greater quantity of zinc can be added than when ferro-manganese is used without danger of making the metal brittle. In the above mixture it is important that the aluminum be present, as without it difficulty will be experienced in obtaining solid castings; in fact, it is necessary to add a small amount of aluminum to all the manganese bronzes, as without it they will not cast solid, but no trouble is experienced in obtaining solid castings when a small amount is used. Manganese bronze in the form of sheets is used extensively for mining screens, as the acid mine waters have no action on it. For rolling into sheets a mixture containing more copper and manganese and less zinc is used.

A substitute for german silver can be made by the use of manganese, the different metals and their proportions being as follows:

	Per Cent.
Copper	67.25
Manganese	18.50
Zinc	13.00
Aluminum	1.25

The color of this metal is very good, resembling german silver closely. It is fully as strong as the best german silver, and has superior casting qualities, which will be appreciated by foundrymen who have experienced some

difficulty in casting german silver. It does not corrode as readily as either german or nickel silver. A test of the electrical resistance of this metal shows its resistance to be nearly four times greater than that of german silver, and is therefore a matter of importance where a metal of very high electrical resistance is required.

Hydraulic Dredging

The recent boring of Newton shoals near Marysville, Cal., demonstrates the feasibility of Government dredging, and the present conference of officials may result in beginning the work. In this regard the work of a hydraulic dredge on the lower Mississippi is of interest.

It sucks up sand and muck from the bottom of the stream and discharges the material 1,000 feet away. It is a clumsy misshapen affair, and at a distance looks as though some factory had slid in the river and had struck a snag. Two smoke stacks belch forth black smoke, and running back of it is a steel tube through which thousands of gallons of water rush, carrying with it the sand which the queer-looking craft sucks up from the bottom. In the center of this boat are centrifugal pumps with 175 revolutions a minute. Each of the two pumps has its own system of pipes, the suction pipes being 33¾ inches in diameter and the discharge pipes 33 inches. A battery of cutters hangs over the bow. The six cutters and their suction pipes are grouped in two sets, each set feeding one of the two principal suction pipes. The cutters are used to loosen the sand, which then is caught in the current of water drawn into the suction pipes, carried up through the centrifugal pumps and out through the discharge pipes. Each of the six suction pipes is 19½ inches in diameter, and carries at its lower end a revolving cylindrical cutter 5 feet in diameter. The cutter has twelve cutting blades, and it is made to revolve through suitable gearing and shafting which is driven by large engines in the dredge. The battery of cutters is so arranged that it can be raised or lowered, and can be brought entirely out of water if necessary. In operation the six cutters whirl around in the sand bar through which the dredge is eating a channel, loosening the sand and feeding it to the great pumps. The raising and lowering is done by a separate engine, which is reversible, and operates the drums, each of which has enough rope to permit the cutters to work to a depth of 20 feet. The cutters whirl around twenty-five times a minute, and cutters, drums and all are controlled from the pilot house of the dredge. To carry the dredge material away from the dredge steel pipes, 33½ inches in diameter, are floated on the water by means of pontoons to the place where the sand is to be deposited. Each 1,000-foot length of pipe is carried by twelve pontoons, of which four are 50 feet long and eight are 100 feet long.

A pontoon is a steel chamber about 7 feet wide and 3 feet deep, in the center of which the discharge pipe lies. It is buoyant enough to float the pipe when the latter is discharging the sand and water forced into it by the centrifugal pumps. Each of the 500-foot pontoons has four water-tight compartments, and the 100-foot pontoons are divided into six water-tight compartments. The pontoons are held together by coupling rods, and the pipes are coupled by rubber hose.

When the discharge pipe is empty the pontoon draws 14 inches of water, but when the pipe is in service and is carrying its regular working load the pontoon sinks until its deck line is but 2 inches above water. The pipes and pontoon are painted inside and out with black asphaltum paint.

The hydraulic dredge can be operated up stream or down stream, pushing with the cutters against the sand bar, or dragging them backward. In the stern of the dredge are two "spuds" or piles, which are driven down into the river bed to act as pivots, permitting the dredge to swing in the arc of a circle, sucking up all the sand which comes near the cutters. By swinging on one of the spuds as a pivot the dredge can remove 1,300 cubic yards of bottom without moving forward. It can move forward at the rate 5½ feet a minute and suck up sand at the rate of 8,000 cubic yards an hour, and in a short time it can cut a channel the full width of the battery of cutters across a sand bar.

This enormous sand sucker requires only seventeen men to operate it. It is 172 feet long and 40 feet wide, and weighs, with its machinery, 1,200 tons. It carries ninety tons of coal and has water ballast to equalize the draught. It has a battery of four 375 H. P. boilers, and the "runners" of its centrifugal pumps are 7 feet in diameter. The engines driving the pumps are triple expansion, and are of the vertical, inverted, four-cylinder tandem type.

The Washington Gun Foundry.

The Washington gun foundry is one of the landmarks of the national capital. Inasmuch as it is there all of the high-powdered guns and their mounts for the equipment of our modern ships of war are manufactured, it is a place of special interest to visitors. Originally established as a navy yard for the construction and repair of warships, it was long since abandoned as such, and is now devoted almost exclusively to the manufacture of guns and ordnance materials. The entire gun plant and appurtenances have cost $2,000,000, and comprise machinery for turning, boring, rifling, jacketing and finishing the immense rifles required for modern battleships, as well as the smaller rapid-fire guns which form such an important part of the secondary batteries of the cruiser gunboats, and, in fact, all vessels of war. The largest lathe in the shop, commonly called the "sixteen lathe," was built for turning out a gun 16 inches in diameter of barrel, 48 feet 7 inches long and weighing 110 tons. The size has been found too large for practical use, however, and the largest guns made for the navy are but 13-inch caliber. The lathe which is to be used for boring the interior of this gun is about 115 feet long and cost nearly $100,000; small lathes are used in the case of smaller guns. Traveling over these lathes, 40 feet from the ground, is an immense crane, capable of raising and carrying from one lathe to another a dead weight of 125 tons. In the center of the building is the shrinking pit, in which are located furnaces for heating the jackets and hooks for use in shrinking the gun tubes. These furnaces are heated to between 600 and 700 degrees; the heating power is naphtha oil with an air blast. A separate building is devoted to the manufacture of gun mounts and carriages.

ALUMINUM "gold recovery" is the latest. The vast interests involved in recent electro-chemical developments of the gold mining industry act as a piquant stimulus to inventors. Another innovation in this sense is recorded in the July "Aluminum and Electrolysis." The idea is to use aluminum cathodes in the electrolyses of weak cyanide solutions. The economic advantage of aluminum over carbon does not appear; but, on the question of novelty, the fact may be adduced that aluminum steamships have been constructed—and that it has been proposed to make the metal hulls of such vessels "cathodic," with the double object of preserving them from oxidation and of recovering gold dust from its native solution in the sea. Neither idea seems of sufficient importance to warrant serious discussion.

BALES & JERRY of Springfield, Ill., claim to have discovered a secret solution by which they coat leaden cartridges, rendering them superior to steel cartridges. The ordinary leaden cartridges, when used in the Krag-Joergensen rifle, have been found to be too soft, and the lead has clung to the barrel of the rifle until the barrel was finally clogged, and the steel cartridges which have succeeded the lead ones have eventually torn the barrel. These cartridges do neither. They offer to sell the Government bullets coated with the secret preparation.

Scientific Progress.

Scientific Prospecting.

By THOS. SMITH.

Prospecting or searching for metalliferous ores is a business of itself, separate and distinct from mining proper, and should never be undertaken without first learning all that is known of the means and conditions of ore depositions. As the greater number of the prospectors now engaged in hunting for the mineral wealth of this and other countries have not had the opportunity to study the subject, it is not surprising that so many failures are made. When we take into consideration the fact that our acknowledged authorities on geology are themselves entirely in the dark on the subject, it is surprising that so much success has been attained.

In prospecting, the archæan or granite and the eruptive rocks are of most interest, the sedimentaries of whatever age being only the recipients of any ores which may be found in them. To explain the manner and causes of ore deposition, I should have to attack some of the pet theories of the acknowledged authorities on geology, a great many of which are stated as facts.

In the first place, metalliferous ores come from the interior of the earth and are ejected by dry volcanic heat, and not by aqueous igneous solutions. When the earth first commenced to cool, all the water was far above its surface in the form of steam. The first rocks formed were the lower crystalline, archæan granite, which were the lightest fluids in specific gravity of the molten mass; as it solidified, cracks were formed, through which volumes of the molten material poured, which cooled and solidified on the suface of the first crust. This continued happening for a long time, until the earth's crust became so thick that it would not pull apart by its own contraction.

When this surface cooled sufficiently, the water, which does not belong, nor cannot stay below the surface of the earth, except in cavities, descended in the form of rain and formed the upper stratum. As the surface continued to cool, its contraction caused immense pressure on the imprisoned fluids, until the weakest part gave way—not in a gentle, quiet manner, occupying a long period of time, but in a sudden, paroxysmal manner, similar to a boiler explosion, the effect being to upheave a long line of crust on its edge, and to make two or three fractures paralleling one another and some distance apart, through which the imprisoned fluids discharged, until the pressure was relieved. Water and steam generation could have had nothing to do with it until the vent was made, as it is absolutely impossible to make a fluid of a lighter specific gravity stay below one of a heavier, so the water must have been above the earth's crust.

These upheavals have taken place at different periods and places, and in some places a number of times, all over the known surface of the world, and our minerals have been ejected from these lines of fracture with the eruptive rocks. When I first studied geology with a view to utilizing it in prospecting, I read that the earth's crust had been crumpled, folded and faulted by the contraction of the interior, and that eruptive rock (porphyry) had been intruded or forced between the bedding planes of sedimentary rocks, the same as it is taught to-day. It was pretty hard to swallow, like Jonah and the whale, but, believing that the authors had evidence which would prove the facts and having no contrary evidence, I accepted it and endeavored to utilize the knowledge in my practice. My experience from that time to the present in actual field work is that both the theories are untenable; that the evidence proves that the upheaval of the granite has not been gradual by means of crumpling, folding and faulting, but sudden, violent, and extending over long lines, and invariably accompanied by a large outflow of eruptive rock, and I find also that the lacolite or intrusive theory is disproved by the fact that where an intrusive sheet (so-called) is examined, the evidence of heat is very marked on the surface of the sedimentary rock on which it rests, but is not visible on the rock above, proving that the upper sedimentary rock was not deposited until the igneous rock had cooled. As most of the sedimentary rocks of which our geological textbooks mainly treat have been deposited through and from water in a similar manner to the deposition of snow and water through air, let us take a few simple illustrations from snow:

Suppose, after a storm had ceased, we were to find a gate or section of fence had vanished and was hidden by the snow, and, in digging it out, found it was lying half way down between the surface and the ground, as much snow above as below, which would be the most unreasonable theory? That it was blown down when the storm was only half over, and covered by that which fell, afterwards, or, as our geological friends would explain it, that it had waited till all the snow had fallen and then intruded itself between the upper and lower layers?

Again, if we noticed that a layer of snow 1 foot in depth was lying on top of a house, and that a layer of the same thickness was lying on the ground alongside, would it be necessary to explain it to state that the earth and house and house-top were on the same level when the snow quit falling, but that it had faulted and the earth had slipped down between that time and the time of our observation?

I would pay no attention to these theories, considering them unworthy of notice, if they had not been used so extensively to explain the manner of ore deposition and the geology of our different camps.

When we read that it is necessary for thermal springs, solfataric action and intrusive porphyry to be present in a camp before it can be an ore producer, and that this nonsense is believed in, indorsed and acted on by the mining engineers, geologists and so-called experts, who are sent down by capitalists to examine our properties, we can understand what are the causes which retard the development of so many of our camps.

Prospecting and ore deposition are comparatively simple matters if we dispense with preconceived theories, and formulate our theories on the facts we find in the camp under investigation in accordance with known natural laws. When we find the granite cropping above the sedimentary rocks, as the axis of a mountain chain, we know that it was upheaved by some seismic action, which also ejected a large quantity of eruptive rock, but that a large quantity did not overflow, but was retained in the crevice forming a dike. If we examine a large surface of the granite (several miles, if possible) we can obtain its true trend and dip, the trend being always taken on a level. This will give us the trend of the fracture fissure and dike therein.

With this as a basis we should examine the opposite side of the ridge or axis to see whether both sides of the fracture fissure were upheaved alike, or whether one side only had been upheaved. When both sides show the same upheaval we shall probably find the eruptive rock spread over both slopes and a depression or trough at the point where the granite takes the opposite dip, following the trend of the granite, and generally filled in with lake (fresh water) sediment. This is the dike, which contracted by cooling and formed a basin or lake on its surface.

If we examine the overflow which we find in the vicinity, not only on the surface, but also that which we find imbedded between the sedimentaries, and also the upper surface of the rocks on which they rest, we will find whether the eruptive rocks are sufficiently mineralized to make it worth while

continuing our work in the vicinity.

In examining the granite we frequently find that after one upheaval had taken place other seismic disturbances had occurred, breaking through the granite floor and upheaving it with all sedimentary and eruptive rocks then lying thereon in a different direction from the first and leaving its dike in the trend of the last fracture. Under these circumstances it is necessary to examine all the eruptive rocks in the vicinity to ascertain which one, if any, of the various eruptions was the mineralized one, or mother of the country, or where there are more than one which will pay to work.

This preliminary work is almost invariably omitted by the common prospector, who, consequently, has no data on which to base a belief that an ore body he may discover will be either permanent or valuable, and as it is also omitted by expert mining engineers or geologists who may be sent to examine a property, their deductions have no more scientific accuracy than the prospector's.

Having ascertained the fact that mineral exists on the surface in reasonably paying quantities, our next step should be to discover where and in what form we may expect to find the ore in the best paying quantities, and in this connection we must study the process of concentration carried on by nature.

All igneous rock and metals occupy a larger space when molten than they do when cooled. Their contraction causes cavities to be formed along their lines of contact with other rocks, and also through their mass, and through these cavities or fissures the water from the surface percolates, carrying with it all soluble substances with which it is impregnated, and also all insoluble substances which it can carry down into the crevice.

(To be Continued.)

THE geology of the Klondike placers will be scientifically determined at as early a date as possible. It is already well understood that the gold-bearing rocks constitute a distinct broad belt running northwest into Alaska from British territory. They are in their lower portions schists and gneisses, with intrusive rocks, and in their upper portion somewhat altered sedimentaries. They are all older than Carboniferous, for the Carboniferous and younger rocks overlie them on both sides of the gold-bearing belt. In this belt the gold occurs partly in quartz veins, partly in deposits formed along shear-zones; in both occurrences it is contained in pyrite, and becomes free on weathering. The quartz veins are distinctly older than the shear-zone deposits, and were formed before the alteration of the enclosing rock to a schist; they have, therefore, partaken of this shearing, and have been broken and sheared so that they are typically nonpersistent. The deposits along shear-zones are, however, of later date than the shearing, and can be continuously followed. The younger beds which overlie the gold-bearing belt consist in part of conglomerates, and some of these conglomerates are fossil placers, which give promise of being productive.

THE largest seismoscope in the world hangs through the center of gravity in the great monument at Washington, D. C. It consists of a copper wire 174 feet long which holds a plummet suspended from its lower extremity into a vessel of water. Two transits arranged at right angles to each other are focused upon the wire just above the plummet, and by means of these little telescopes the slightest vibration of this great mass of stone is indicated upon a graduated scale. The expansion of the monument's south face, on a hot summer day, sometimes shifts the apex northward a few hundredths of an inch, and high winds frequently cause a slight variation from the normal position of the wire. Occasionally, however, the plummet swings violently when the weather is calm and cool, its motion under such circumstances being ascribed to vibration of the earth itself.

Chrome Ore.*

By M. A. CLOUET.

This mineral, known by the name of chrome iron ore, chromate or chromite of iron, and industrially employed for the manufacture of the different chromates and their derivatives, is found in almost all the larger divisions of the globe. In Europe it is met with in France, in the department of Var, but the mine located near Cogolin is now exhausted. In Russia it is found in different parts of the Ural mountains; it also occurs in Norway, in Syria, Hungary and the Shetland Islands. In America chrome ore has been discovered in the surroundings of Baltimore, Wilmington, Del., and California. In Asia chrome ore beds are known near Madras, India, and Karahissar, Asia Minor. Finally, an important mine was opened in Australia several years ago.

Wherever the deposits may be located, they all belong to the same formation. They are either in the form of pockets, beds or veins, and always in the same igneous strata which enclose aluminous bisilicates, feldspar, stealite, mica, garnet, talcum, serpentine stone, asbestos, etc., in large quantities. The gangue or surrounding rock is also of the same formation everywhere, and consisting of the constituents of the previously named minerals, viz: silica, alumina and magnesia. These three bodies are always found there closely associated, but they vary in their respective proportions according to locality, deposition of beds or lodes, and the more or less careful sampling in the mine itself.

The gangue is mostly white or gray, but sometimes variously colored, green, rose, peach, violet and blue when a little oxide of chrome is present, or yellow, red and brown by the presence of iron oxide.

Sometimes it is found mixed without connection with the ore proper in more or less rounded grains, as in the deposits of the Ile-a-Vache, Baltimore, Wilmington and Norway. Sometimes it forms a layer of variable thickness separating the metallic strata as in India and Russia, or it is like a paste in which the metallic parts are agglutinated as in Asia Minor and Australia. All the known chrome iron ores are of perfectly defined chemical composition.

In the same manner as the surrounding strata are always composed of silica, alumina and magnesia; the ore itself is always a combination of protoxide of iron and sesquioxide of chrome. This combination of the two oxides, however, is not a single one—that is, it does not consist of equal equivalents. On the contrary, its composition in this respect varies greatly according to the localities where the deposits are found.

1. The chrome ore of the Ile-a-Vache, America, Norway (Christiania), Hungary and France is protochromite of iron.

Indeed, whatever the tenor in metal of samples analyzed may have been, they all consisted of one equivalent of sesquioxide of chrome combined with one equivalent of protoxide of iron. The ore also corresponds to the protoxide of iron and manganese, and can be represented by the formula

$$Cr^2\ O^3\ 2\ Fe\ O.$$

2. The chrome ore found in Russia, in the government district of Orenburg, Smyrna, Norway (Drontheim) and Syria is bichromite of iron. It consists of two equivalents of sesquioxide of chrome and one of iron, corresponding to bioxide of manganese, and represented by the formula

$$Cr^2\ O^3\ Fe\ O.$$

3. Russian ore from the government district of Viatka consists of three equivalents of sesquioxide of chrome and one equivalent of protoxide of iron; hence it is a trichromite of iron, represented by the formula

$$3\ Cr^2\ O^3\ 2\ Fe\ O.$$

4. The ore of Orsova, Hungary, is a combination of five equivalents of sesquioxide of chrome and two of protoxide of iron, or $2\frac{1}{2}$ parts chrome to one of iron. Its chemical formula is

$$5\ Cr^2\ O^3\ 4\ Fe\ O.$$

5. The Indian ore consists of five equivalents of sesquioxide of chrome and four equivalents of protoxide of iron, represented by the formula

$$5\ Cr^2\ O^3\ 8\ Fe\ O.$$

6. The Shetland and California ores consist of five equivalents of sesquioxide of chrome and three of protoxide of iron, the formula being

$$5\ Cr^2\ O^3\ 6\ Fe\ F.$$

7. The Australian ore is a combination of four equivalents of sesquioxide of chrome and three of protoxide of iron, represented by the formula

$$2\ Cr^2\ O^3\ 3\ Fe\ O.$$

Having received several thousand kilograms of chrome ore from the Ile-a-Vache, I examined the grains and found that, although they were partly rounded, they showed plainly a crystalline structure; the color was a brilliant black. Their composition I ascertained to be as follows:

	Per cent.
Sesquioxide of chrome	51.53
Protoxide of iron	48.46
	99.99

It will be seen that this ore is a protochromite of iron. I analyzed other grains together with their gangue, and found always a constant relation of one to the other, and the quantity of sesquioxide of chrome and protoxide of iron.

Analyzing successively chrome ores of different origin, and taking care to take samples differing in appearance and metallic tenor, I always obtained for ore from one and the same locality a constant relation between the oxides of chrome and iron.

The chromites of iron, therefore, are real chemical combinations, corresponding to the oxides of iron and manganese in which the protoxide of iron would represent the metal, and sesquioxide of chrome the oxygen.

Analysis of Iron Chromites.—The natural as well as the artificially produced iron chromites are not attacked even by concentrated and boiling acids when heated to white heat. The same is the case with their gangue, alumina and silicate of magnesia.

In order to analyze the chromites it is, therefore, necessary to first calcine them with an alkaline carbonate which separates the sesquioxide of chrome from the protoxide of iron, and forming a soluble chromate which at the same time makes the decomposition of the silicate of magnesia possible by the action of an acid. Five to ten grams of the ore are pulverized to a fine powder, which, after having been dried thoroughly, is mixed with five to six times its weight of pure carbonate of soda. The mixture is heated in a platinum crucible for five or six hours to white heat. During heating the crucible should not be closed hermetically so as to allow the access of air.

After having cooled off, the crucible is placed in such a position that its cover can be provided with a porcelain capsula filled with tepid water, which is heated to a mild boiling until the yellow, green or brown contents of the crucible are either well detached or completely dissolved. The crucible is washed, and all peroxide of which some quantities often adhere to it, recovered by means of hydrochloric acid.

When the temperature has been very high and calcination prolonged, the chrome oxide is not only converted to chromic acid and the protoxide of iron to peroxide, but the latter have been superoxidized, and perchromate of blue soda and perferrate of red soda have been produced, so that the matter in the crucible is not yellow, as would be supposed, but represents a greenish brown appearance. By treatment with water, the excess of alkali precipitates this perferrate of soda, without changing it, in the form of soft flakes. By boiling the solution, oxygen is disengaged at the same time as perchromate and perferrate of soda are reduced. The peroxide of iron regains its usual aspect and the green color of the solution disappears. Boiling is continued until the solution has become yellow. If this precaution be neglected, the alumina which has to be precipitated later would be of a reddish color, being mixed with peroxide of iron.

The capsula, therefore, contains in solution:

The surplus of carbonate of soda,
Aluminate of soda,
Chromate of soda.

The insoluble part is composed of:

Peroxide of iron,
Silicate of magnesia,

and sometimes a little chrome iron, which has escaped the action of the alkaline carbonate.

The liquor is allowed to settle in the capsula, then filtered. The sediment should be avoided as much as possible, hence it is washed and decanted repeatedly until the washing water is colorless. The liquid obtained (*A*) is put aside in a test tube.

Then crucible and filter are washed with hydrochloric acid in order to remove completely all the peroxide of iron which may adhere to them. This liquor is poured into the capsula. There are then added water, a large surplus of hydrochloric acid and a little nitric acid, and the whole brought to a light boiling. Peroxide of iron is dissolved immediately, but the gray-colored, shining molecules of silicate of magnesia are seen to ascend and descend and trouble the liquor. It takes a considerable length of time until this silicate is decomposed. Then the liquor becomes perfectly clear; and, if a little chrome iron has remained unattacked, it is deposited promptly at the bottom of the capsula. It is easily recognizable by its deep black color and metallic condition. Then the solution is filtered, washed, heated and calcined again with carbonate of soda in order to add the products of the second calcination to those of the first.

The clear liquor and the washing water are slowly evaporated, either in a water bath or a sand bath or a drying stand. The dry residuum is treated with hydrochloric acid, water added and filtered. Thus the silica is obtained.

Then the liquor containing the chlorurets of iron and magnesium are treated with ammonia in order to recover the peroxide of iron (a titrated solution of permanganate of potassium may be used as well) and with phosphate of soda to obtain the magnesia.

Liquor *A* containing the carbonate is diluted with water and poured cau-

ORES AND CORRESPONDING VALUES IN MN.

Ore.			*Corresponding Value.*
Protochromite	Ile-a-Vache, America, Norway, Var, Hungary	one equivalent of oxide of chrome one equivalent of protoxide of iron	Fe O Mn O
Bichromite	Russia, Asia Minor, Syria, Norway	two equivalents of oxide of chrome one equivalent of protoxide of iron	$Mn\ O^2$
Trichromite	Russia-Viatka	three equivalents of oxide of chrome one equivalent of protoxide of iron	$Fe\ O^3$ $Mn\ O^3$
Chromite of Australia		four equivalents of oxide of chrome three equivalents of protoxide of iron	$Fe^3\ O^4$ $Mn^3\ O^4$

Chromite	California, Shetland	five equivalents of oxide of chrome three equivalents of protoxide of iron	$Fe^3\ O^5$ $Mn^3\ O^5$

*Translated from the French for the *American Manufacturer*.

tiously under continuous stirring with a glass rod into a test tube filled with hydrochloric acid. The alumina soon separates and the liquor becomes troubled. Add hydrochloric acid until the liquor is completely clarified and has adopted a red color. Oversaturate with carbonate of ammonia and filter the liquid after boiling it in order to remove the surplus of the precipitant which otherwise might dissolve some of the alumina.

Before filtering, the liquor should be diluted with boiling water in order to facilitate the washing of the alumina which retains the chromate with great tenacity. By stirring the deposit while it is still in suspension in the filter, and by using boiling water, the discoloration of the alumina is accomplished most simply and quickly, but in all cases this washing requires considerable time.

The yellow liquid and the washing water are then evaporated in a porcelain capsula, hydrochloric acid and alcohol added to disoxidize the chromate of soda, whereupon the sesquioxide of chrome is precipitated by means of ammonia.

When the analysis has been executed properly, it will be found that the sum of the weights found for silica, magnesia, alumina, sesquioxide of chrome and peroxide of iron exceed that of the matter analyzed; but when the peroxide of iron obtained is transformed into protoxide, both weights correspond exactly.

ANALYSES (1).

1° Protochromites of Iron: $Cr^2 O^3$ 2 Fe O.

ORE FROM—	Ile-a-Vaches, in grains (octahedral)	Baltimore, in lumps	Wilmington, in grains	Norway (Christiania), in grains	Var, in lumps	Hungary, in lumps

Total	100.00

The Artificial Production of Iron Chromites.—It is easy to produce artificially all the iron chromites that are found in nature. For this purpose a pure concentrated solution of sulphate of protoxide of iron, and another of sesquioxide of chrome, are used in such a proportion as to correspond to the composition of the natural combination that is to be produced artificially. The two solutions are mixed with a slight surplus of ammonia, and the whole quickly filtered in order to avoid the access of air as much as possible. The residuum, together with a little carbonate of ammonia and borax, is heated in a platinum crucible to a white heat, when the chromite of iron appears with all the physical and chemical characteristics of the natural mineral of corresponding composition, viz., gravity, insolubility in strong and boiling acids, color and metallic luster. When roasted together with borax the iron chromite produced corresponds to protochromite. It can be obtained in octohedral crystals, like the ore from the Ile-a-Vache.

These analyses, of course, do not show exactly how much commercial chrome oxide is contained in the different ores, the chrome tenor varying, so to speak, with each lump from the same mine. But they represent the average of numerous analyses of hundreds of thousands of kilograms of ore which I have handled during the last twenty years.

Robinson G. M. Co.'s Report.

From Capt. Thos. Mein, general manager of the Robinson, South Africa, Gold Mining Co.'s property till May 30th, is received the annual report of the company for the calendar year 1896. During the year were milled 177,500 tons, producing:

	Bullion, ozs.	*Value, £.*
Mill	129,627	472,206
Concentrates (by chlorination)	10,655	44,113
Tailings (by cyanide process)	30,985	103,601
Total	171,267	619,920

In all 44 days 12 hours were lost in milling. Of this 16 days were attributable to breakdowns of machinery; about a similar period to the current working of the mill; and 12 days to want of native labor and other difficulties encountered at the beginning of the year. The duty per stamp per diem works out at 4.6 tons, crushing through a 900 mesh screen.

The mill costs were as follows:

	£ s. d.	£ s. d.
Rock Breakers—		
White and native labor and food	1,061 2 0	
Power	989 13 10	
Stores (oil, waste, etc.)	1,870 16 0	
		3,921 11 10
Transport of ore to mill		979 15 2
Milling—		
White labor	2,209 13 0	
Native labor and food	660 3 6	
Mercury, 2500 lbs	277 5 2	
Heads	201 16 7	
Shoes, 83,408 lbs	1,232 13 3	
Dies, 36,969 lbs	542 16 9	
Stems	158 15 0	
Cams and shafting	161 10 6	
Mortar boxes	196 0 0	
Screens	452 11 2	
Belting, tappets, sundries	530 4 5	
Stores for battery and engine	760 13 9	
		7,404 3 1
Fuel, main engine		7,767 5 7
Water—		
White labor	795 13 6	
Native labor and food	129 10 6	
Fuel	2,286 10 2	
Stores	453 14 2	
		3,665 8 4
Mill Maintenance—		
White and native labor and food	1,856 17 9	
Stores	1,065 13 8	
Proportion of workshops' expenses	254 13 9	
Cut timber	149 17 6	
Foundry castings	393 9 6	
		3,720 12 2
Vanner Concentration and Maintenance—		
White and native labor and food	1,000 7 6	
Power and water	1,643 5 5	
Vanner rollers	192 10 0	
Vanner belting	385 0 0	
Cut timber	12 0 0	
Foundry castings	12 13 3	
Stores	423 18 2	
Proportion of workshops' expenses	50 18 9	
		4,620 13 1
Assaying and Smelting—		
White and native labor and food	346 3 6	
Stores (chemicals, coke, fuel, etc.)	362 11 3	
		708 14 9
Total		32,788 4 0

The main feature in the past year's cyanide working is the additional 10 per cent which has been obtained in extraction. It will be seen that, of the total product coming from the mill, the percentage of sands obtained for treatment has increased from 53.7 in 1895 to 56.3 in 1896. As, however, this is still below the average of some of the works on the Rand, every effort is being made to increase the proportion, and it is possible that the figures for 1897 will show an appreciable improvement in this direction. There has been a slight increase in the working cost per ton compared with that of the previous year. The profit resulting from this department amounts to £88,831 8s 6d for the year. By the decision given by the High Court at Pretoria in the "Cyanide" case, the company has benefited considerably as regards both back royalty and that which would have accrued on future productions.

Statement of costs is given below, as well as particulars of the value and quantity of material treated.

COSTS.

	1896. £ s. d.
Wages (whites and natives, including food)	3,486 15 1
General supplies	1,268 9 0
Fuel and power	1,466 7 9
Cyanide, 54,371 lbs	3,371 8 6
Zinc, 22,485 lbs	383 3 5
Filling and discharging vats	4,813 8 4
Total	14,769 12 1

DETAILS OF WORKING.

	1896.	*1895.*
Tonnage milled	177,500 tons.	140,655 tons.
Tailings and concentrates caught for treatment	99,905 tons.	75,825 tons.
Percentage of tonnage milled	56.3	53.7
Contents in fine gold	33,469.33 ozs.	27,585.87 ozs.
Fine gold recovered	24,714.27 ozs.	17,626.03 ozs.
Per cent of extraction	73.8	63.89
Bullion produced	30 985.42 ozs.	22,157.15 ozs.
Value	£103,601 0 7	£72,553 10 1
Profit on working	£ 88,831 8 6	£52,110 4 5

Prior to June the chlorination roasting plant consisted of three reverberatory furnaces. In that month the construction of two more was completed, and the vat capacity increased accordingly. We have still on hand a heavy stock of purchased concentrates, and contracts are running for the delivery of considerable monthly parcels. Since the enlargement of the plant these latter have been promptly dealt with, and the old stock is being steadily renewed. Satisfactory results continue to be obtained as in former years.

The initial start with the treatment of slimes was made at these works about the middle of November, 1895, but no return was made until the end of January, 1896. Up to the close of the year 75,814 tons have been dealt with, for which the company received £11,769 3s 8d, plus £3303 6s 9d for our half share of the profits made in working. This department, in common with the other works, has suffered great inconvenience during the year through the scarcity of native labor, and has also had to contend with many difficulties in raising the product from the dams and delivering it at the works. The original plant was designed to treat sands and slimes in about equal proportions, but in actual working it was found that the percentage of sands was so small as to render it inadvisable to treat this product separately. Half of the plant had, therefore, to be altered and adapted to the treatment of slimes. Owing to the above given causes the quantity handled has been some 20,000 tons less than was expected. The expense of converting the sands portion of the plant has been charged to revenue account, and this, to some extent, explains the high cost of treatment, which has amounted, up to the 30th of November last, to 9s 9.47d per ton, inclusive of royalty, which is 3 per cent of the gold won.

The year's expenses for mining, milling, general charges, cyaniding and mine development, together with the expenditure for machinery, plant and buildings, are as follows:

	£	s	d
Mining, including mine maintenance	110,747	11	5
Milling, including mill maintenance	32,788	4	0
General maintenance	4,387	3	7
General charges (see revenue account)	20,044	13	6
Cyanide expenses	14,769	12	1
Total	182,737	4	7
Mine development	37,091	10	5
Machinery, plant and buildings	28,008	6	8
Grand total	247,837	1	8

NOTE.—The averages are worked out on the basis of the tonnage mined and milled.

There is very little difference in the costs of working compared with those of 1895. The expenses would have been somewhat lower but for the heavy sums expended in obtaining native labor, which, when secured, proved in many instances lamentably inefficient, owing to the boys' low physical condition and their lack of experience. The agreement arrived at by the majority of mine managers to reduce the rate of native wages from the first of October has been steadfastly adhered to by this company since that date, and a saving in wages has been consequently effected; but it by no means covers the outlays which we have been compelled to make to keep the staff at anything like the requisite strength and train the raw material.

Acetylene Gas.

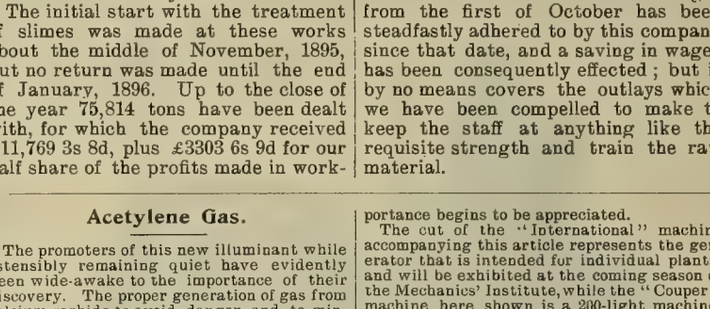
The promoters of this new illuminant while ostensibly remaining quiet have evidently been wide-awake to the importance of their discovery. The proper generation of gas from calcium carbide to avoid danger and to minimize cost has been the object aimed at.

While new factories have been building for the manufacture of carbide, the inventive genius of the American brain has been in operation on generators, burners, tips, etc. The carbide plant at Niagara Falls has just increased its capacity from four to thirty-two furnaces, and now has a capacity of twenty tons per day. In addition to this plant there are factories in Rochester, N. Y., Appleton, Wis., Duluth, Minn., Chicago, Ill., and negotiations are now pending for the construction of a furnace at Sacramento, Cal., where cheap electrical power is obtainable.

When it is realized that acetylene gas is much more brilliant than either coal gas or the incandescent electric light, and can be produced at half the cost, the commercial importance begins to be appreciated.

The cut of the "International" machine accompanying this article represents the generator that is intended for individual plants, and will be exhibited at the coming season of the Mechanics' Institute, while the "Couper" machine here shown is a 200-light machine, being especially constructed for Messrs. Whitaker & Ray for their new hotel, lodge and store building at Galt, California.

There have been from time to time notices of explosions from acetylene gas, notably one recently in Paris, France, but in every instance this has been attributable to the condensing or liquefying of same. As the accompanying generators are automatic and never permit a pressure of over five pounds on the gasometer this danger is illiminated, and the insurance companies are enabled to approve their use for domestic purposes.



GENERATOR FOR INDIVIDUAL PLANTS.

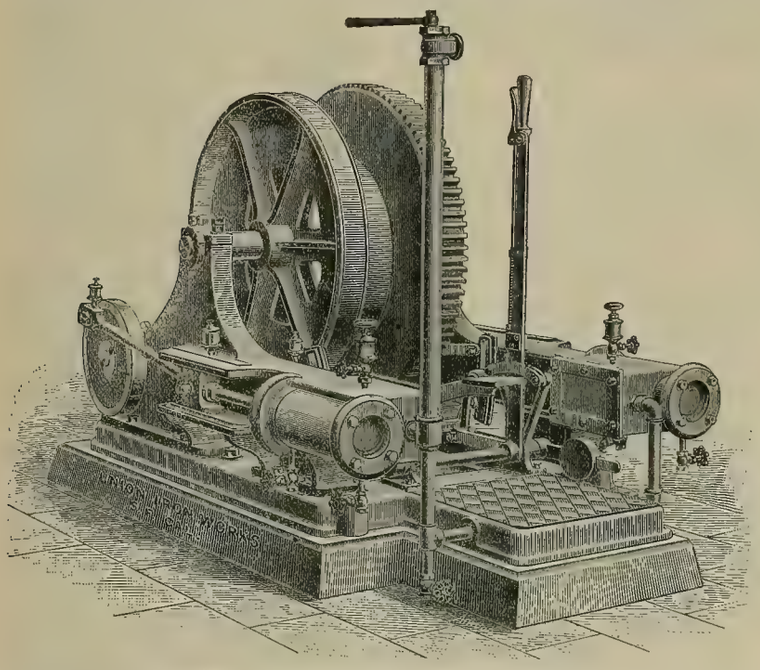
Acetylene headquarters in this city are at room 75, No. 916 Market street. There will be a working exhibit at the Mechanics' Fair. Several machines are in use and giving satisfaction.

UNION IRON WORKS,

★ ★ 222 Market Street, San Francisco, Cal. ★ ★

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST



HOIST FOR PROSPECTING.

For Prospecting Purposes or Underground Work,

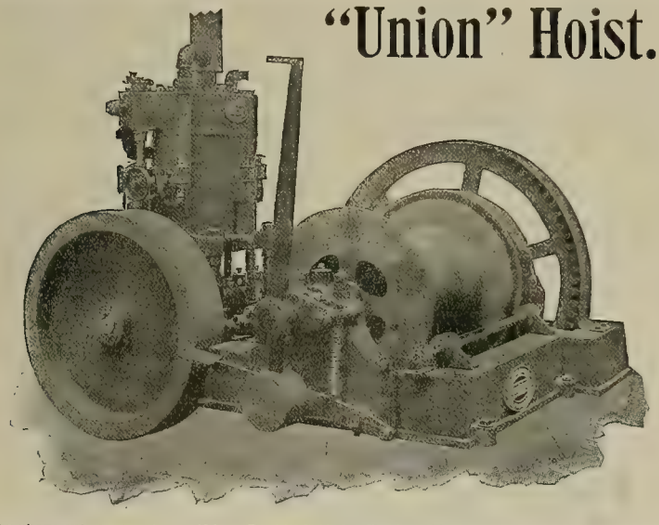
USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

"Union" Hoist.



The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over 600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

—BUILD THE—

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

Office: 314 HOWARD ST., SAN FRANCISCO, CAL.

Coast Industrial Notes.

—G. Galbraith of Tulare with a single harvester has cut 3260 acres of grain in sixty-two days, an average of fifty-two acres a day.

—The California price of hay has doubled this week, now being from $11.50 to $16 a ton. The consumption of hay in San Francisco amounts to over 150,000 tons annually.

—There is now only one place where Sequoia timber can be obtained, the Government of the United States having reserved all of it, except that found in one canyon below Fresno, Cal.

—The Central Light and Power Company incorporated in San Francisco this week; F. Pauson, C. L. Ackerman, J. Naphtaly, A. E. Brooke Ridley, J. M. Loewe, G. Gerst; capital stock, $1,000,000; $50,000 subscribed.

—The contract for constructing the coast defense works at Admiralty Head, Whidby Island, has been awarded to Maney, Goerig & Rydstrom of Everett, Wash., for $84,980.50. There is an appropriation of $125,000.

—The Native Lumber Company of San Jacinto, Cal., has sold 4000 cases to the honey men in that vicinity, which means twenty-five carloads, 500,000 pounds, which at 3 cents per pound makes $15,000 in that one valley for honey.

—The Brooks-Follis Electric Corporation has incorporated at San Francisco; capital stock, $25,000, subscribed as follows: James H. Follis, John W. Brooks, $2350 each; Harrison Brooks, Richard H. Follis and E. A. McInerney, $100 each.

—The annual report of the Oregon Railway & Navigation Company for the year ended June 30, '97, shows an increase of $1,015,321 in net earnings over the previous year. Total earnings, $4,718,354; operating expenses, $2,779,047; net earnings, $1,939,307.

—The Columbia river salmon pack is a normal one—470,000 cases of 2 doz. 1-lb tins each. British Columbia papers prophesy that 1897 will witness the largest catch in the history of the Fraser river salmon industry. The catch on the northern coast seems to be a failure.

—The Puente, Cal., oil producers, having drained their wells and wandered away from the oil-bearing stratum in sinking new wells, have, by the aid of a representative of the State Mining Bureau, found the oil stratum again and secured one of the finest flows of oil yet developed in southern California.

—Active work on the tunnel of the Great Northern railroad in the Cascade mountains, in western Washington, began yesterday. The tunnel will be two and a half miles long, 16 feet wide and 23 feet high. It will cost $2,000,000, and require two years in building. It will reduce the ascent by 1000 feet.

—At Corral Hollow, Cal., $1,872,000 has been spent in developing the coal property. F. J. Horswill, the new manager, has changed the system of mining from the "long wall" to the "breast and pillar" method. He calculates ability to extract 1000 tons daily at a cost per ton of 60 cents. Over 100 men are now employed at the mine.

—Eureka, Cal., has decided to accept the offer of C. A. Harp to build a railroad from Eureka to Grant's Pass, Or. Harp asks the citizens of Humboldt to subscribe $375,000, to furnish ten acres of land for a railroad terminus in Eureka, ground for a terminus in Arcata, and free right of way for the road between Eureka and Arcata.

—The East Oakland, Cal., electric railroad was sold under foreclosure this week for $60,500. The road carried an indebtedness of over $250,000, so that all interested except holders of receiver's certificates have lost all they put into it. The purchaser was the Realty Syndicate, which is absorbing all the lines on that side of San Francisco bay.

—The success of the Columbia river timber towing rafts of '95 and '96 lend interest to the similarly constructed one now at Seattle, Washington, about completed. H. R. Robertson will start with it for San Francisco this week. It is 527 feet long, 50 in diameter, and will draw 20 feet of water when finished. There are about 450,000 feet of piling and a number of spars.

—Between 2000 and 3000 men are employed in the construction of the Nelson and Lethbridge railway, between Lethbridge and Macleod, B. C., a distance of thirty miles. The company is also working west of Macleod for 100 miles. Survey parties are strung out to the foot of Kootenay lake. Men are clearing the right of way from Crow's Nest pass to the crossing of the Kootenay at Wardner.

—In commenting on the new tariff and the $2 duty on white pine, Dominion papers say it means a complete lock-out of Canadian lumber, and if they make any sales to the United States lumber buyers they expect it will be for delivery to some outside market for transmission in bond through United States territory; they suggest that the Canadian Government impose an export tax of $3 per thousand feet on saw logs, and $2 per cord on pulp wood.

—The lower Otay dam, twenty miles southeast of San Diego, Cal., has been finished to the 134-foot contour line, and the machinery is being moved to the Barrett dam, thirty miles further on. As the dam now stands, it has an impounding capacity of 13,766,328,500 gallons, or 2918 miners' inches. It is the first dam of the four now under construction by the Southern California Mountain Water Company. The Otay dam has cost thus far $200,000, and the entire system will have cost, when completed, $3,000,000.

—The irrigation system of the Southern California Mountain Water Company comprises three dams, impounding a total of 51,000,000 gallons of water. Lower Otay reservoir, eighteen miles from San Diego, is nearly finished, and will irrigate the country under 400 feet elevation, taking in a good many acres of frostless citrus land now lying waste for lack of water. Barrett dam is thirty-five miles from San Diego, and, with Morena dam, will irrigate every foot of land lying south of the Sweetwater system to the Mexican line. Work on the foundation of Barrett dam has begun.

—The thirtieth annual Mechanics' Fair began last Tuesday evening at their Pavilion in this city. There was a large attendance, 3000 people being present. In the afternoon there were introductory exercises at the Columbia Theater. President Denicke said:

It is my pleasant duty to welcome you to the thirtieth industrial exposition of the Mechanics' Institute. I hope you will agree with me that each exposition is an improvement on the last.

On this occasion, in compliance with a resolution passed at a late congress in this city, our chief feature will be an exhibition of pure food.

The board of Health has undertaken an inspection of foods, with a view to extinguish the trade in spurious foods. This was a wise idea. The prosperity of this State depends largely on the excellence and purity of the articles produced here for sale at home and abroad, and, as this is a food-producing State, upon the excellence and purity of our food products especially. We want to perfect our processes so that the words "Made in California" shall be, all the world over, a guaranty of quality, purity and general excellence.

I am sorry to have to say to you that the successive Mechanics' Institute fairs, while demonstrating the development of the State as a producer, have not illustrated a corresponding progress in manufactures. This has been due to various causes, one of which is the high price of coal. I am happy to express to you my hope that this drawback is likely to be removed; what steam has been to the nineteenth century electricity will be to the twentieth, and I look forward to the time when, instead of bringing coal from the mines, it will be converted on the spot into an electric fluid, which will be conducted by wires to the cities and villages, there to be used for power, light and heat.

Mr. Irving M. Scott delivered an oration on "Labor-saving Inventions." He said:

Man came into the world with undeveloped intellect and unskilled hands, with which to gain a livelihood and to defend himself against his fellow and against beasts of prey, heat and cold, storm and flood. He was but a waif, dependent upon nature for charity. But as her gifts were not at all times ample to meet his requirements for the necessaries of life, and as security from harm was constantly threatened by prowling beasts, necessity stimulated him to invent implements of defense and attack, as the flint, the spear and the bow and arrow. The invention of these implements was a glorious triumph for intellect—saved, perchance, the human race from extinction and made man "lord of the fowl and the brutes."

As population increased and man's requirements multiplied he supplemented the gifts of nature by domesticating the cow, horse, hog, goat and sheep; invented implements of husbandry, as the plow and harrow; also invented the yoke and harness for the ox and horse, and thereby caused them to plow the field and harrow in the sown seed.

The invention of gunpowder was another marked triumph of man over the forces of nature. Obstacles that had hitherto seemed immovable were, by its application, instantly burst into diminutive fragments; fortifications that could have withstood the assaults of the battering-ram and catapult indefinitely were readily demolished, and vast armies armed with their wonted weapons were but chaff in presence of the gale.

In consequence of the invention of gunpowder manifold enterprises that would not have otherwise been were projected and successfully executed.

Thus mines and quarries that otherwise would have remained intact were worked and their material utilized, roadways and canals built, shafts sunk and tunnels driven through mountains and under rivers. If the invention on one hand saved the labor of thousands of men, on the other hand it produced employment for tens of thousands.

The art of printing seems to have been practiced by the ancients, as evidence by the Roman stamp and by every Babylonian brick and signet ring. The first printing press in Europe, however, was invented in the fifteenth century. Prior to this event books were in manuscript.

As inventions multiplied, the need of a better motive power than that of horse and other animals began to be sorely felt, and this led to the invention of the windmill and water wheel. The winds were too inconstant to afford steady employment to labor. The stream or waterfall subject to the effects of drought, was very often too remote for its force to be applied to the work required to be done. In view of these disadvantages necessity stimulated man to invent the steam engine, a device susceptible of indefinite application—no task too delicate nor too mighty for it to accomplish.

Notwithstanding the great efficiency of the stem engine, it, of itself, was found inadequate to meet the requirements of the progress and civilization which it had so largely caused and fostered. To effect the objects required, necessity stimulated genius to invent electrical apparatus by which messages can be conveyed at a speed ten million times as rapid as they can be by the fastest locomotive, and light and power transmitted to points indefinitly distant from the source of energy. So that immense as have been the benefits conferred upon the world by the steam engine, experience demonstrates that the invention of electrical apparatus for the practical purposes of life far transcends that of the steam engine. It may, perhaps, be urged that the steam engine is the prime motor and the electrical apparatus the secondry. That this relation obtains in certain instances is true.

Some may cavil—rail against inventions, to the end that their introduction throws men out of employment and distracts business. If such be the case the inconvenience is only temporary, and the loss quickly and amply recompensed.

Personal.

CLARENCE KING is in Seattle, whence he contemplates departure for the Klondike.

J. W. ROGERS has resigned the superintendency of the Wedge mine, Randsburg, Cal.

HAMILTON SMITH, who has been visiting the Coeur d'Alenes, is in Salt Lake City en route to Colorado.

F. J. HORSWILL succeeds Jno. Treadwell in the management of the Corral Hollow, Cal., coal mines.

SUPT. SIMPSON of the Eureka Mining Co., Soldier Creek, Oregon, is in the city to buy a mill for that property.

T. J. NOLTON has resigned his position of superintendent Klamath Flume & Mining Company, Siskiyou, Cal.

CHAS. A. ROGERS has gone to the Klondike to represent San Francisco, Los Angeles and Denver men who propose investing there.

W. FARISH, formerly superintendent of the Sierra Buttes and Independence quartz mine at Sierra City, is at the G. Reynolds mine near Gold Lake.

C. B. WINGATE, superintendent Feather Fork mine, Plumas Co., Cal., has gone to report to the company's officers the present condition of the mine.

T. S. WOOD, the first man to demonstrate that gold ore of a gross value of $4 per ton could be profitably handled at Leadville, Colo., has gone to Klondike.

C. R. CORNING of New York, is examining and reporting on property owned by the Niagara Mining Co., at Middletown, Shasta Co., and the Yellowstone group, Trinity Co., Cal.

AT Gold Creek, Nev., Schuyler Duryee has been appointed general manager. In the placer mining department W. Stofiel succeeds Capt. Pinder. Col. Church has been relieved of his duties as chief engineer.

A. J. BOWIE, whose departure for the Klondike under engagement for one year at a salary of $25,000 was chronicled in this column last week, does not go "for the Rothschilds" as generally stated. He represents Jas. R. Keene.

PAUL JOHNSON, superintendent of the Hall mines smelter, Nelson, B. C., has resigned to take a similar position with the Guggenheim's in the reduction works at Ajuas Calielpas, Mexico. He will leave as soon as his successor is appointed.

PROFESSOR CHAS. D. WALCOTT, Director of the U. S. Geological Survey, is on his way here inspecting and directing the field work of his bureau, more especially the survey and examination of the forest reserves, for which Congress, at its last session, made a special appropriation of $150,000. He will not return to Washington until October.

AT Santa Cruz, Cal., this week assembled several representatives of electrical transportation companies. Among those present were Mr. Gilbert of Sacramento, representing the Sacramento Gas and Electric Railway Company; J. R. Eastwood, general manager of the San Joaquin Electrical Company; Mr. Balch of the San Gabriel Power Company; Mr. Ensign of the Southern California Power Company; E. W. Sutcliffe and Dr. Charles Van Orden of the Central California Electric Company of Sacramento; Harry Edwards of the Electrical Improvement Company of San Jose; C. N. Beale of Bakersfield of the Kern River Company; W. J. Barrett of Los Angeles, representing John A. Roebling & Sons Company of San Francisco; S. P. Cram of the Electrical Power Company of Chicago; F. M. Pickering and J. A. Lighthope of the Electrical Improvement Company of San Jose and R. S. Masson, coast electrical engineer of the Westinghouse Electrical Company of San Francisco.

Commercial Paragraphs.

THE Colorado Iron Works Company, Denver, Col., report the shipment of six ore cars, made from special patterns, to United Globe mines, Globe, Ariz.; one large round bowl slag truck, capacity 35.16 cubic feet, to Pueblo Smelting & Refining Co., Pueblo, Col.

AT the opening night of the Mechanics' Fair in this city, August 17, the board of jurors upon whom devolved the duty of deciding which exhibit made the best showing and was most completely arranged awarded Washburn, Moen & Co. first prize, $100; in the machinery exhibit, Joshua Hendy Machine Works, first prize, $100; Simonds Saw Company, second prize, $50.

CAPT. J. R. DE LAMAR has awarded a contract to Horace F. Brown of Chicago for six straight mechanical roasting furnaces for the new Golden Gate mill at Mercur, Utah. Two of these furnaces will be used as driers and four for roasting ore, having a capacity of 500 tons per day. Fuel gas will be used and a complete regenerating system for pre-heating the air from the waste heat of the furnaces will be employed, giving the greatest possible economy of fuel. It will require about 450,000 pounds structural iron and machinery, 250,000 red brick, and about 150 tons of fire-brick and fire-clay material for the roasting plant.

WILLIS SHAW, contractors' machinery, 506 New York Life building, Chicago, reports the following sales: A car of hoisting engines to Lantry Sons at Pontoosuc, Ill.; two narrow-gauge contractor's locomotives, to Peppard & Johnson, Minneapolis, Minn.; 30-ton locomotive, for Ganahl Lumber Co., Arkansas; an equipment of Shaw dump cars, to Carey Construction Co. at Fort Worth, Tex.; also pumps and boilers to Christie & Lowe, for their contract at Sabine Pass, Tex. The Pacific Bridge Company, who have the contract for Government fortifications at Narrowhead Point, have also placed an order for a 54-ton steam shovel, to be used on this work.

Recent California Mining Incorporations.

The Anglo-Alaskan M. D. Co., S. F.; capital stock, $1,000,000; $500 subscribed.

Montauk G. M. Co., S. F.; A. Ames, E. S. Adams, J. Edwards, S. F. Barnes; capital stock, $1,000,000; $1000 subscribed.

Western Investment, Klondike and Alaska Mining Co., Los Angeles; H. M. Dougherty, A. F. Spawn, W. C. Bogart, L. W. Morgan, S. B. Kimball; capital stock, $1,000,000; $500,000 subscribed.

Pacific Exploration Company, S. F.; H. L. Atkinson, C. W. Willard, J. B. Goldstone, J. C. Anthony, W. A. Plymire; capital stock, $1,000,000.

El Sueno de Oro M. Co., S. F.; J. A. Leonard, J. E. McCulloch; M. Kane, J. G. Humphrey, A. F. Hopke; capital stock, $64,000; $5000 subscribed.

Klondike Co-op. M. & T. Co.; J. E. Locke, W. P. Wilson, C. N. McLouth, W. E. Rothery; capital stock, $10,000; all subscribed.

Oro Fino M. and M. Co., Pomona; capital stock $15,000, paid up; H. E. Griffin, W. M. Avis, G. W. Hill, F. W. Balfour, S. N. Laudou.

Recently Declared Mining Dividends.

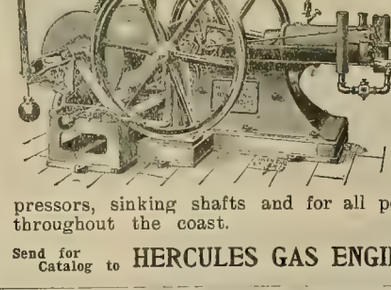
The Gwin mine, Cal., 30 cents per share, $6000, payable immediately; the second dividend paid under the present management.

Champion Mining Company, Cal., dividend No. 40, 25 cents per share, Aug. 16th.

Santa Rosalia M. Co., Mexico; 10 cents per share; Aug. 16.

Dutch M. & M. Co., Cal.; dividend No. 2, 5 cents per share; $7500; payable Aug. 18.

Hercules Hoisting Engines



Solve the difficulty of fuel, and make mining profitable where steam power is too expensive. Over 3000 Hercules Gas and Gasoline Engines are in use, giving entire satisfaction. Fully guaranteed. Requires no engineer. No smoke, no dirt. No danger.

We build engines from 2 to 200 h. p. for pumping, hoisting, running air compressors, sinking shafts and for all power purposes. Used in mines throughout the coast.

THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,
330 Market Street.....San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.
Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Notes on Assaying and Assay Schemes.
By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

Prospector's Field Book and Guide.
By H. S. Osborn.....$1 50

A Practical Guide for Prospectors and Miners.
By C. W. Moore. With numerous illustrations.....$4 75

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.
With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and enlarged. Profusely illustrated....$5 00

Electricity in Mining.
By Sylvanus P. Thompson.....80 cts.

Practical Treatise on Hydraulic Mining.
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid.....$5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Metallurgy of Silver.
By M. Eissler. Profusely illustrated.....$4 00

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

Aaron's Leaching Gold and Silver Ores.
By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid.....$3 00

Manual of Assaying—Gold, Silver, Copper and Lead Ores.
By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 533 pp. Price, postpaid.....$2 50

The Metallurgy of Gold.
By M. Eissler. Profusely illustrated.....$5 00

A Text Book of Mineralogy.
Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

Notes on the Treatment of Gold Ores.
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

A Practical Manual of Minerals, Mines and Mining.

AMALGAMATING MACHINES.

CASTINGS AND FORGINGS
OF EVERY DESCRIPTION.
All work tested and guaranteed.

IMPROVED PORTABLE HOISTING ENGINES.

Improved Self-Contained Three or Five Stamp Mill,

Saves bill for heavy timbers, millwright and mechanics' labor, and a large amount of space. The term self-contained means a great deal for the mine owner, and can be readily recognized and appreciated in making an estimate for an ordinary plant when the comparative cost is considered.

FIRST: There is saved a large bill for heavy timbers, in many instances obtained at great expense and loss of time.

SECOND: The saving in millwright and mechanics labor in framing and erecting.

THIRD: The large amount of space saved.

FOURTH: The great saving of freight,

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WAVE AND SWELL MOTOR.—Henry Schomberg, Los Gatos, Cal. No. 587,511. Dated Aug. 3, 1897. The object of this invention is to provide a mechanism whereby the rise and fall of a suitable float, produced by the action of the swell or waves, is applied so as to compress air or lift water into a tank which forms a storage and regulator from which the air or water may be applied to drive an engine or any desired machinery at a regular rate of speed. The power is so applied that the least rise or fall observable in the locality where the apparatus is placed will produce a sufficient stroke in the pump to operate it properly. In conjunction with this is shown a disengaging mechanism operating automatically, so that an excessive rise and fall will act to disengage the parts, so that no more than a full stroke of the pump will be produced, and the intermediate mechanism will be protected from injury. This mechanism consists essentially of toothed rack bars pivoted to a rising and falling float, a lever extending transversely across the line of travel of the rack bars, spring-actuated rollers carried by the lever, normally pressing the toothed edge of the bars forward, pawls fixed upon the levers engaging the teeth of the rack bars, bell crank fulcrumed levers and stops so disposed as to engage the arms of these levers alternately when the main lever reaches the end of its stroke.

AUTOMATIC GOVERNOR FOR AIR BRAKE CYLINDER PRESSURE.—Andrew J. Clark, Oakland, Cal. No. 587,643. Dated Aug. 3, 1897. This invention relates to a means for automatically regulating the pressure in railway or brake cylinders, the object being to prevent the wheels of railway cars from sliding. It consists essentially of a governor mechanism depending for its operation upon the rotating parts of the car wheels, a relief valve in connection with the air brake cylinder and an electric circuit by which the governor mechanism operates the relief valve to regulate the pressure in the brake cylinder, whereby the brakes are set up to the wheels with the degree of pressure required, and will be relieved if the pressure is so great as to cause the wheels to slip.

AIR BRAKE SLACK ADJUSTER.—Walter K. Conness, Oakland, Cal. No. 587,519. Dated Aug. 3, 1897. This invention relates to a device which is especially designed for automatically taking up the slack of the bottom rod or car brakes as fast as the wear of the shoes or other parts approaches such slack. It consists in the combination with a car truck, bearing wheels, brake beams and shoes and brake-actuating lever of a rotary shaft having a pulley fixed upon it, a connection between a second brake-actuating lever and the pulley, a holding ratchet wheel fixed upon the shaft and a pawl engaging said ratchet wheel, arms turning loosely upon the shaft having a pin connecting them, a second ratchet wheel intermediate between the arms adapted to be engaged by the connecting pin when the arms are caused to swing upon the shaft, an intermediate mechanism connecting the arms with the live lever rod, whereby the arms are moved and the ratchet shaft actuated whenever the parts become slack from wear.

HAND MEASURERS FOR GLOVES.—T. C. DeLisle, San Francisco, Cal. No. 587,940. Dated Aug. 10, 1897.—This invention relates to a measuring instrument which is especially adapted to take measurements of the hand for the purpose of glove fitting. It consists essentially of an expansible and contractible measuring loop in conjunction with a measuring plate for determining the length of the fingers. The loop is formed of a resilient material adapted to receive the hand, and a device is connected with one portion of the tape to increase or decrease the area of the loop which is formed within it. A bar connected with the opposite portion of the tape is moveable therewith to and from the hand, and a spring-controlled slidable measuring plate is so placed that the fingers lie thereon, having a lug which is engaged by the fork of the fingers, so that the measuring plate is adjusted by the projection of the hand to the proper place in the loop.

California's 44th Annual State Fair

WILL BE HELD AT SACRAMENTO, . . .

TWO WEEKS. September 6th to 18th, 1897.

THIS ANNUAL EXHIBITION will embrace a complete representation of the Agricultural, Mechanical and Industrial possibilities of the State.
MECHANICAL DEVICES can be here shown to a better advantage, and, if meritorious, receive recognition of value in placing them on the market.
THE EXHIBIT OF PRODUCTS from lands offered for sale, gives both sellers and buyers an acceptable opportunity to meet.
THE LIVE STOCK DEPARTMENT is eagerly sought each season by buyers desiring to replenish their herds with stock of new blood lines. This is necessary and insures sales to all exhibitors.
THE POULTRY EXHIBIT will constitute a most important division of this year's exhibition, and will offer a most excellent chance for buyers to view the various breeds of fowls in comparison.
THE DAIRY DEPARTMENT will have a complete working exhibit showing the latest methods in dairying, and the working of improved appliances. Competent instructors from some of the leading creameries in the State will be in charge to give instructions to all in this growing industry.
ELECTRIC POWER, space and light will be furnished free to exhibitors.
GRAND MUSICAL CONCERTS will be held each evening at the Pavilion by the **California Exposition Band.**
THE RACING PROGRAMME will form one of the leading features of amusement, and usually attracts a large attendance that are of benefit to all exhibitors.
TO MANUFACTURERS AND DEALERS we say exhibit your goods and wares, meet the public on neutral ground and profit by advertising in a practical way. The public attends these exhibitions in vast numbers to be instructed as well as amused.
FREE TRANSPORTATION for exhibits and excursion rates will be given by the Southern Pacific Company on all their lines.
Address the Secretary for special information. Send for Premium Lists.

EDWIN F. SMITH, Secretary. C. M. CHASE, President.

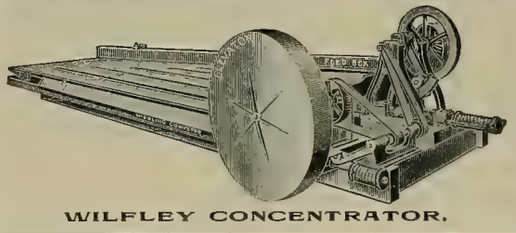
One of these machines will take the place of two or three belt concentrators of any style and do very much better work.



WILFLEY CONCENTRATOR.

SEND FOR CIRCULARS.

Extract from letter of July 23d, 1897, from the Mine and Smelter Supply Co. of Denver, Colo., to Messrs. White, Rogers & Co., San Francisco, Cal.:
Mr. Reed, general manager Caroline Mining Co., Colorado, has 34 Woodburys. We have up to date sold him 8 Wilfleys, and we understand that he is to replace all of the Woodburys with Wilfleys.
We have just received a test run made between the Wilfleys and Woodburys at the Iowa Gold Mining and Milling Co., Silverton, Colorado, and give you the results:
WOODBURYS—24 hours; 1 oz. gold; 8.5 ozs. silver; 6 per cent lead; 1¼ per cent copper; 12 per cent zinc; 60 per cent silica.
WILFLEYS—24 hours; 3 ozs. gold; 25 ozs. silver; 13 per cent lead; 6½ per cent copper; 17 per cent zinc; 10 per cent silica.
The Wilfley Table made 750 pounds more of concentrates than machines handling same quantity of pulp on the other side of the mill.
They have just ordered three more of the Wilfleys, and expect to take out jigs and put in Wilfleys in place of fine jigs, etc., etc., etc.

Who Sees Your Advertisement?

Is an important question. When asked for an "ad" demand proof of extensive circulation among probable purchasers.

W. & P. Insulating Coating.

Water, acid and alkali proof. Unaffected by gases, fumes, or moisture. An absolute non-conductor of heat or electricity.
Unequaled for electrical work of every kind. Excellent for floors, sinks, trays, vats, tanks, refrigerators.
Equal to paraffine as an insulator, and more convenient. Odorless when dry. Hardens in from five to twelve minutes.
Can be used in safety in confined places, as it contains no bisulphide of carbon, ether, or other poisonous ingredients.

Barrels, 75c; Five-Gallon Cans, 80c.

STACK AND BOILER PAINTS, ROOF PAINTS, READY ROOFING, ROOFING FELT, ROOFING COMPOSITION, COAL TAR, BUILDING PAPER.

MINERS, ATTENTION!

We beg to call attention to our "RISDON HAMMERED" Shoes and Dies, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density.

These Shoes will outlast any other make and will not chip or cup.

We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.

Our prices are as low as any, and the article we offer should commend it to all mine owners and mill men.

Assaying Gold
.....AND.....
Silver Ores.

By C. H. AARON.

THIRD EDITION JUST OUT.

A Standard Work.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Perface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press,** 330 Market St., San Francisco.

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 19, 1897.

With a falling off in the demand from Alaska, the market is resuming its normal condition. The expected fall demand has not set in yet, although an enlarging call with increasing orders is reported by jobbers. With machine and ironworkers in general there seems to be a more confident and cheerful feeling regarding the future. The prevailing opinion is that with grain, fruit, feedstuff and dairy products selling at higher prices and a more pronounced boom in gold mining than for over a quarter of a century, there will be a big demand for farm implements and mining machinery. The organizing by capitalists on this coast, at the East and in Europe of companies for mining augurs well for the future of this coast.

The local money market continues to work easy with considerable more disposition shown to put out funds. There is more cal for crop moving purposes, particularly for wheat going into warehouse. The high and, so far, advancing markets for grain cause growers to sell slow and unless they get their figure they store and get advances. Collections are improving although more or less friction is reported from some sections. Since the mint started up over $4,000,000 have been added to the gold coin supply. The bulk of this has gone into circulation. The exports of California products to foreign countries are large, (last week they aggregated in value over $1,-200,000), which add still more money to the general supply. Our New York advices state that the money markets are generally easy with the rate of exchange falling owing to heavy exporting and freer buying abroad on American securities. It is thought that gold importing from Europe will set in soon and that from $20,000,000 to $40,000,000 will be received this year. While this may be true yet if the money markets in this country do not go up it is not at all likely, for the rates of interest abroad are steadily appreciating.

New York Silver Prices.

NEW YORK, August 19.—Following are the c osing prices for the week:

	—Silver in— London.	N. Y.
Friday	25¾	55¾
Saturday	25½	55
Monday	25¼	54⅜
Tuesday	25 1-16	54
Wednesday	24¼	52¼

London Sight Bankers	$4.88
Refined Silver, per oz., 1000 fine	.52
Mexican Dollars	Nominal

SILVER.—The markets at home and abroad have receded still further. The decline the past week is nearly 4 cents per ounce firm, with seemingly the bottom not touched yet. European advices state that the lower prices have been brought on by selling offers from America; and in the absence of a European and China demand and a light call from Europe, dealers bid lower each day. The low prices are causing a general shutting down of extensive silver mines, and may also cause the closing of many that can be worked at profit even with silver around 40 cents an ounce fine. The decline is also demoralizing the export trade in this country and Europe with silver using countries, and it is also weakening securities of this country, which will make itself severely felt abroad.

MEXICAN DOLLARS.—The decline in silver has completely unsettled the market value of Mexicans, making it impossible to quote correctly. Brokers will not buy much except they have an order, and then only at about the bullion value; but they sell in small quantities at 43¼@44 cents.

QUICKSILVER. — The market is weak. The demand is slow for the season. Silver mines continuing to shut down is lessening the consumptive demand. Exports by sea the past week aggregated 100 flasks, to Central America.

Our market is quoted at $38 for domestic consumption.

COPPER.—The market has strengthened the past week, both at the East and abroad. Although the output is in excess of last year, yet it is cared for by increase in the consumption abroad and also at the East. With trade improving at home and abroad, it ought not to cause surprise if still better figures obtain.

Our market is quoted as follows:

Ingot casting, jobbing	13@—
Ingot " wholesale	12½@—
Sheet copper	—@16½
Bolt	¼ and 5-16, 20c; ⅜ and larger, 16½

TIN.—The market has made another advance at the East and abroad, the market closing strong. Ours is firmer. The upmove is said to have been brought about by speculative buying in Europe.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " light, "	4 00@—

LEAD.—The market has held firm, with a stronger tone at the close. The East reports a fairly active business passing at full figures.

Our market is quoted in jobbing lots as follows per pound:

Pig	—	@	4 80
Bar	5 00	@	5 25
Sheet		@	6 25
Pipe	5 25	@	5 50

SHOT.—The market is firm.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs			$1 35
Drop, B and larger sizes,	"	"	1 60
Buck, Balls and Chilled, do,	"	"	1 60

POWDER.—The market is steady.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

IRON.—The market with us is practically unchanged. At the East slightly better prices rule under an improved demand for both home and export.

AMERICAN.

	To Arrive.	Spot.

ANTIMONY.—The market is steady.

Our market is quoted at 8¾c in a jobbing way. New York mail advices quote 7¾c for Cookson's, 7¼c for Hallett's and 7c for Japanese.

NAILS.—The market is steady with an active demand reported.

Wire, carloads, basis per keg			
" jobbing, " "			$2 10
Cut, carloads, " "			
" jobbing, " "			2 00

BORAX.—The market is steady.

The market is quoted as follows:

Refined, in carload lots, in barrels	5
Refined, in carload lots in sacks	4¾
Powdered, in car lots	5
Concentrated, "	4½

PLATINUM.—The market is quiet.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

ZINC.—The market is steady.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

Chemicals.

While importers are disposed to firm up in their views to meet the higher duties, the liberal stocks carried by the trade is against it at present. So far as we are able to learn the latter have not advanced prices and probably will not so long as competition is active and goods bought at old prices are in hand. The same condition obtains at New York, with the exception that there importers are very heavily stocked, and as the demand from jobbers is quite slow, almost nothing, they are not disposed to firm up.

SULPHURIC ACID.—The demand is fair We quote in a jobbing way at 1½c per lb for 66%.

ACETIC ACID.—The market is firm at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported steady from store at 6⅞@7c per pound in carboys.

BLUE VITRIOL.—Our market is firm.

We quote in a jobbing way at 4½c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is firm.

Our market is quoted in a jobbing way at $1.50 a pound.

BONEASH.—The demand is good.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3⅞c; No. 2, 2½c.

PHOSPHORUS.—The market is firm.

We quote in a jobbing way at 70 to 75 cents per pound.

SODA ASH, 58% (LeBlanc process).—The market is firm at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is firm at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—There is a fair demand at 2½c a pound from stores.

NITRATE OF SODA.—Market is stronger. Our market is quoted from store at 4c for 95%.

Mining Share Market.

SAN FRANCISCO, August 19, 1897.

The market has been flat, stale and unprofitable the past week to chippers, both bulls and bears. There have been some fluctuations, but of such small proportions as not to admit of enough profit to risk the venture. The lively moves in wheat are drawing dealers to futures in that cereal, and so long as it continues active, with lively fluctuations, just so long will it continue the gamble, unless the moneyed inside mining share pool should come into the share market to make a deal. That this can be done, and on merit, does not admit of questioning, for it has been done before on just such an unpromising outlook, and it is safe to say that what has been will be again, although it must be admitted that the low price ruling for silver is against it unless the gold-bearing ore is extracted. The news from the mines continues to be largely a repetition of what has been reported for some time past. A saving in the official letters could be made by having the superintendent of every mine in which work is being done furnished with printed letters in which they can fill in the level, number of feet run and the direction. This would save considerable time and probable expense. Gen. Bob Morrow's "little cats" to the public, but, if reports are correct, big-paying mines to him and associates strengthened the past week—Caledonia selling up to 25 cents and Overman to 20 cents. It may be that he is getting ready to have the public know about more ore being found, so as to report, in official letters to be filed, an increase in the output of the latter. Standard showed further firming up—selling up to $2 a share. There is a very strong probability that one or more dividends will be disbursed this year. The surplus fund in the treasury, with July expenses paid, is over $27,000, and it is stated that the net profits for the current month will increase this to fully $40,000. The new electric plant is said to give the best of satisfaction and makes quite a saving to the company. Tests of low-grade ore in Con. Virginia are said to run an assay value of about $14.

From the Comstock mines private news is not dished out lavishly, or if it is, the dull and heavy market causes people to pay little attention to it. This is to be regretted, so far as concerns the business calling of those whose stock in trade seems to be the getting up of reports from the mines suitable for the occasion. The official letters are skeletoned, affording very little, if any, information of a satisfactory character to the public, if the letters from Con. Virginia, Chollar and Potosi be excepted. These appear to be fuller and more complete. From the Utah mine no change in the character of the work and material encountered is reported. Shareholders of Sierra Nevada can console themselves with the knowledge that the company has found a 20-cent assessment down here, even if not able to show up much ore on the Comstock. Since its incorporation the total amount of assessment collected is $6,666,910, and dividends disbursed $102,500. The work in the mine is confined to the Layton tunnel and 900 foot levels and in the same directions as reported last week. In Union they are still pushing slowly forward to the south on the 900-foot level. In Ophir the west crossdrift on the 1000-foot level is in 304 feet; it is getting suspiciously close to the west lode, and, therefore, it is liable to be stopped at any time. Work is still south from the old Comstock tunnel level.

In Andes a north drift has been started from the east crossdrift on the 175-foot level. In Mexican they are still running an east crossdrift on the 1000-foot level. The official letter from Con. Virginia reports continued work to the west on the 1000-foot level. On the 1550-foot level they are running a south drift and also an east crossdrift, and on the 1650-foot level they are working at several points, with no particular change to note. No ore was extracted. Work is still continued by Best & Belcher and Gould & Curry in the joint east crossdrift 800-foot Bonner shaft level. Nothing comes to hand from Bullion or Exchequer. They are stoping ore in Alpha on the 500-foot level. The quantity is small to what can be taken out if desired; but then it may be for the best, for it is said that if more were taken out a larger assessment would have to be levied to pay milling or other charges. In Savage the work is on the same level heretofore reported. Work in Potosi is largely confined to the 100-foot level. A small streak of $20 to $30 ore has been struck. No material change comes to hand from the work done jointly to the west by Con. Imperial, Challenge and Confidence, neither is there anything new to report from Confidence or Yellow Jacket. The joint work to the west in Kentuck by Yellow Jacket, Crown Point and Kentuck is being pushed slowly ahead. From Crown Point, Belcher and Seg. Belcher nothing new is reported in this week's letter. In Overman, it is said, better work is being done.

There are dealers who still cling to the Brunswick lode proposition as the coming "sesame" to a share market. The joint work of Con. Virginia, Best & Belcher and Gould & Curry is confined to the 400-foot level. On this level they are running a south drift, a north drift and an east crossdrift. On the 600-foot level they are running a south drift. In Occidental they are at work on the 550-foot and 650-foot levels; on the former they are running east and on the latter they are running south. The official letter from Cholar reports they are still sinking incline shaft No. 1. They are still stoping on the 300-foot and 400-foot levels. The ore is lessening in quantity. On the 500-foot level they are running south and also upraising to connect with the 400-foot level, and sinking to connect with the 600-foot level. On the latter level they

WILL NEGOTIATE with owners or their duly authorized agents only.

WILL INVESTIGATE only thoroughly bona-fide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

HO! FOR ALASKA'S GOLD FIELDS!

Greatest gold fields on earth. We have just published a complete guide to Alaska fully describing all her rich gold fields, telling how to get there, cost of trip, routes, etc., also mining laws. Fully illustrated; only reliable book. Facts and views secured by special correspondents right on the ground. Post yourself by securing "inside" information ahead of the crowd. For the present we will send a book free to anyone sending us 25c postage for a 3 month's trial to our big illustrated weekly family paper. Clubs of 5 and 5 books, $1. Agents send 25c for sample. Mention THE PRESS. *Weekly Sentinel*, Denver, Colo.

WANTED.

A position as Millman in quartz mill by young man, one who can keep a mill running. Address A. E. CHARLESWORTH, Lockeford, San Joaquin County, California.

WANTED.—A Second-Hand 5 OR 10 STAMP MILL.

Address, stating particulars, price, etc., A. B. this office.

Wanted for the Yukon,

Two or three capitalists to become associated with two experienced explorers and gold miners, one of whom has spent five years in the Yukon and tributaries exploration, is thoroughly conversant with the topography of the whole Yukon auriferous belt and knows of valuable diggings yet untouched which can be secured and operated to great advantage by the methods proposed to be adopted. The highest references will be given, and required. Amount necessary for expenses and plant, $25,000. This being a genuine proposition only principals need apply. For further information, address

"YUKON," this Office.

ANNUAL MEETING.—The Regular Annual Meeting of the stockholders of the Marguerite Gold Mining and Milling Company will be held at the office of the company, No. 237 Twelfth Street, San Francisco, California, on MONDAY, the 23rd day of August, 1897, at the hour of 8 o'clock P. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. Transfer books will close on Saturday, August 21st, at 2 P. M. F. METTMANN, Secretary.

Notice for Bids.

Sealed proposals will be received by the TUOLUMNE WATER COMPANY, at Columbia, Cal., for building a cob-work timber dam on the South Fork of Stanislaus river, according to the plans and specifications on file in the company's office. Bids should be marked on the outside of the envelope, and will be opened on Saturday, September 4, 1897. The privilege of rejecting any and all bids is reserved. By order of Board of Directors.

J. B. POWNALL, Secretary.

Assessment Notices.

ROSE CREEK MINING COMPANY. Location of principal place of business, San Francisco, California; location of works, Star, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of June, 1897, an assessment (No. 1) of 15 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 163, Crocker building, junction Post, Montgomery and Market streets, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 21st day of August, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on TUESDAY, the 14th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. M. WILMANS, Secretary.

Office—Room 163, Crocker building, San Francisco, California.

MARGUERITE GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of July, 1897, an assessment (No. 7) of 10 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, 235 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of September, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 11th day of October, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

F. METTMANN, Secretary.

Office—287 12th street, San Francisco, California. The Secretary will also receive payments from 12 to 5 P. M. at his business office, 225 Sansome street.

INYO MARBLE COMPANY.—Location of principal place of business, San Francisco, California; location of works, Inyo, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of July, 1897, an assessment (No. 30) of 16 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 323 Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of August, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 20th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. A. CAHN, Secretary.

Office—Room 323 Phelan building, San Francisco, California.

OSBORN HILL GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Grass Valley, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 4th day of August, 1897, an assessment (No. 6) of 35 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, room 11, No. 331 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of September, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 27th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. R. GRAYSON, Secretary.

Office—Room 11, No. 331 Pine street, San Francisco, California.

CONSOLIDATED CALIFORNIA AND VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 3d day of August, 1897, an assessment (No. 9) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to to Secretary, at the office of the company, room 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of September, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 29th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 3d day of August, 1897, an assessment (No. 28) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of September, 1897, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on THURSDAY, the 30th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

GOLD RIDGE CONSOLIDATED MINING AND Milling Company.—Location of principal place of business, San Francisco, California; location of works, Nevada and Sierra Counties, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 3rd day of August, 1897, an assessment (No. 5) of 4 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, rooms 12 and 13, No. 43 Sixth street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of September, 1897, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 9th day of October, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

H. SYLVESTER, Secretary.

Office—Rooms 12 and 13, No. 43 Sixth street, San Francisco, California.

FOR SALE CHEAP.

Machine for Making Slat Fence.

Good opportunity. CALIFORNIA WIRE WORKS, 330 Market Street, Corner Battery, San Francisco.

FOR SALE CHEAP.

Gold Wet Washing Machine,

MAIT'S MAKE.

Capacity, 8 Tons Per Day.

Good order. Can be carried anywhere by prospector.

Address T. L., this office.

FOR SALE CHEAP.

First-Class Air Compressor (Steam driven) and Drill, New.

Also, 3-Ton Capacity Pulverizer.

A. L. FISH, 59-61 FIRST ST., San Francisco.

Valuable Silver and Lead Mining Property for Sale.

The property is known as the **Montezuma Silver Mining Co. of Utah**; is situated on the Little Cottonwood, Alta, Utah, comprising the "Montezuma," "Savage," "Hiawatha" and "Last Chance" locations, also the "Buckland" tunnel, 1500 feet long, and over it the "Savage" tunnel, 800 feet long, with openings connecting the tunnels. The mine is in good working order, with considerable ore in sight. The ore is rich in lead and in good demand by the smelters.

For terms and any other information, address David R. Peirce, Sec'y and Treas., 210 West Larned St., Detroit, Mich.

FOR SALE.

PROMISING QUARTZ MINE

In Sierra County, California,

With 10-Stamp Mill, run by Steam or Water Power. Fully equipped with all necessary tools. Free water. A little more development will make the mine a first-class proposition. Address "E," P. O. Box 2504, San Francisco, Cal.

FOR SALE.

23,000 Feet 10 5-8 Inch Steel Pipe,

Lap welded and screw joints. Weight about 27 lbs. per foot. Will stand about 600 lbs. pressure

Three Compound Duplex Worthington Pumping Engines,

Several Pumps and Heaters,

And everything pertaining to a plant capable of elevating 3200 gallons water per minute 550 feet. Plant only operated one week. Address

LEE CHAMBERLAIN & CO., Los Angeles, Cal.

FOR SALE.

The Following Machinery, Nearly New. Now Located in State Agricultural Exposition Building at Sacramento:

One 16x42 R. H. Poppet-Valve O'Neil Automatic Cut-Off, 100-Horse Power Horizontal Engine, built by the Union Iron Works, with Band Pulley, 22 in.x124 in. Pipe Connections and Valves complete, as it now stands.

One 22 in. Double Leather Driving Belt.

One 18 in. Union Exhaust Steam Feed Water Heater.

One Buffalo Duplex Boiler Feed Pump 6x4x6.

Two Tubular Steam Boilers, 54 in. diameter, 16 ft. long, in good order, with Furnaces, Grate Bars and Settings complete; one Injector for each Boiler, and all the necessary Checks, Valves and Gauges.

One Stack, 48 in. diameter by 80 ft. long.

For price and particulars, address

EDWIN F. SMITH, Secretary, Sacramento.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

PATENTS

PATENTS OBTAINED IN ALL CIVILIZED COUNTRIES

DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

Southern Oregon Mines.

In April, 1851, California gold miners along the streams of Siskiyou and Shasta counties heard of newly discovered diggings farther north, and heading for Rogue river in southern Oregon found hydraulic mining ground that through the years has furnished considerable gold. The fluctuating nature of the industry in Oregon is illustrated by the fact that while in 1884 that State produced $552,472 in gold, the output for '96 is estimated at $1,950,000, showing that there as elsewhere the depression in other lines of industry caused renewed attention to be given to mining—the original source of all human wealth. Of the amount stated southern Oregon produced about 40%: of this percentage by far the largest part was from the hydraulic mines. There is a little surface quartz mining going on in that section of the State, but no depth has in any instance been attained.

JOSEPHINE MINE, ROGUE RIVER, OREGON.

The conditions and climatic surroundings make hydraulic mining in southern Oregon a most congenial employment. The gold is fairly plenty; transportation is easy; no legal restrictions exist; wood and water abound; the climate is fine, and labor is easily procured. There are several operated mines that return good dividends, and a large number of paying claims. The pipe and giant so far constitute the main form of hydraulic mining, though wing-damming and dredging are receiving some recent attention.

On this page and on page 192 are given some typical views of mines in Josephine Co. The Josephine mine on Rogue river, Grant's Pass district, has long been worked and has always paid well; the Merrill mine, Galice Creek district, shows, incidentally, a device for removing stumps, etc.; the Junction mine, close to the Merrill, and where the three forks of the creek unite, is particularly well supplied with water, the lack of dumping facilities being partly compensated for by the recent construction of 1200 feet of flume. At the adjacent Forest Queen mine, on Louise creek, are four ditches, 1500 ft. hydraulic pipe, 1400 ft. flume and two giants.

Since the first piping at Scott's gulch, near Waldo, in 1854, the harnessed streams of southern Oregon have washed out many millions in gold, and, as in other sections of the coast, the amount mined is but a fractional index of the golden store still to be produced. Of late years mining has become "fashionable" again in Oregon, the hard times causing many to take up the more profitable industry. One of Oregon's most urgent needs is some mining legislation. At present it is considerably behind its sister States in this regard.

MERRILL HYDRAULIC MINE, GALICE CREEK, OREGON.

Useless to Hoard Silver.

A Denver, Colo., report that there was a general movement among the smelters of Colorado and elsewhere to hold silver produced until a shortage of the supply occurs, for the purpose of creating a demand and a consequent better price, occasioned inquiry by the *Republican*, which developed the fact that such a movement was not only extremely unlikely, but almost impossible under present conditions. In 1893, when the Indian mints closed, an attempt of this kind was made by some of the smelters in the hope that an advance in the price would result; but it failed, and the conditions were much more favorable at that time than they are now. Smelters and ore and bullion buyers all agree that nothing could be accomplished by such a movement at this time, as the call for silver in China, Japan and India, on account of existing conditions, is constantly growing less, and there is no probability that there will be any increased market for some time. It is conceded on all sides that the only thing to do is to sell the silver for the market price. It can always be sold, even though the demand is decreasing; and while there is comparatively little silver mining—that is, for silver alone—the accumulation as a by-product of gold, copper and lead mining is sufficiently large to make the matter of holding the product for better prices a very serious drain upon the resources of the strongest reduction companies, especially as there is no immediate prospect of any relief from any source.

As one ore-buyer said: "There would be no use in trying to hold it on a falling market. If there was anything in sight we might hold it for a short time, but I don't think there is a smelter in the world that could afford to hold silver three months, and the stock now on hand is enough to keep the price where it is for that time."

From the best obtainable sources of information it would seem that the bottom price of silver had not yet been reached.

Land Office Business.

For the second time within a year the Commissioner of the General Land Office has visited California and San Francisco. When Mr. Lamoreaux was here he was met at the northern gateway of the State by corporation attorneys in a private car and sedulously guarded while here. His lax nature, his questionable compliance with all corporate suggestions and his nimble haste to grant all corporate wishes in the mineral land business is a matter of history to all who have noted the progress of this famous and infamous absorption of the public domain with official consent and connivance.

This week Lamoreaux's successor was here—a different type of man—"unawed by influence and unbribed by gain"—accessible to the people, coldly avoidant of questionable corporate favors. Had he been in his present position three years or two years ago, the mineral lands of California would not be in their present plight. Just now he is powerless to do anything in the matter.

Commissioner Hermann's present visit to California is to make the best settlement possible in the matter of the Benson claims. A brief history of this business, as outlined in a Washington dispatch is of present interest:

The Interior Department, under the direction of the new Administration, has undertaken to dispose of these frauds, which had their beginning in the years from 1878 to 1885 in this State. They consisted in false surveys, which cost the United States more than $1,000,000. The last of the Benson contracts, as they are known, remain unsettled, although the recent Commissioner of the Land Office, Silas W. Lamoreaux, did his best to give Benson and his associates all that they asked for. He might have succeeded had not Secretary Francis in one instance, and Commissioner Hermann in another blocked him.

Commissioner Lamoreaux first prepared an estimate to go into one of the appropriation bills for $50,000, to satisfy all of the remaining claims in these fraudulent surveys, but Secretary Francis would not approve the estimate, and it was not submitted to Congress. Lamoreaux can never offer ignorance as an excuse for his action, because he prepared the estimate under protest of H. L. Collier, one of Secretary Hoke Smith's appointees and an expert, who had made careful examination of these surveys and was well satisfied that they were fraudulent. Collier, for his pains, was dismissed by Lamoreaux's orders.

When Hermann succeeded Lamoreaux as Commissioner of the Land Office he soon discovered that his predecessor had approved the accounts for the five remaining "Benson surveys," and had sent them, in all amounting to $50,000, of which $35,000 was for surveys and $15,000 for other claims, to the Treasury Department for payment as soon as an appropriation might be available. This also was done against the protest of Inspector Collier. Commissioner Hermann caused the agents of the Interior Department to conduct an investigation which satisfied him that Lamoreaux should never have approved the accounts. He immediately sent an order to the Treasury Department and had the papers returned to the Division of Accounts of the Interior Department. He also issued notice to Benson and his associates to show cause why the payment of their remaining claims should not be suspended. Benson, with his attorneys, hastened to Washington and spent some days arguing and pleading with Commissioner Hermann to let Lamoreaux's approval of the accounts stand. But when Commissioner Hermann produced the reports of the agents of the Land Office showing conclusively that the surveys were not valid and had not been made honestly, Benson weakened and proposed a compromise. This compromise Commissioner Hermann entered into and by its terms the surveys will be made over again honestly; and, when approved by the agents of the Land Office, will be paid for. The United States, for the time being, agrees not to prosecute civil suits to recover money which was paid out of the Treasury on fraudulent claims.

The evidence best shows the character of the business. Benson soon after his arrival in this State entered the Government service as deputy surveyor. He held this office until May, 1879, when he tendered his resignation to Surveyor-General Wagner of the State of California on account of his "wish to engage in business which in some respects might be incompatible with his duties as deputy surveyor." Prior to his resignation he and his associates had secured surveying contracts to the amount of $77,000 from the Surveyor-General, but after his resignation Benson's name disappeared from the rolls of the Surveyor-General's office as a contracting deputy, and thereafter he employed men to make surveys in California and in other States. These men were appointed deputy surveyors upon the request of Benson, and without their knowledge he took contracts in their names. He had them sign blank bonds, contracts, oaths, powers of attorney, etc., of which they knew neither the import nor the use.

Benson paid some of his men monthly wages of $50 to $60, and with others he divided the profits of contracts taken in their names. He nominated such men as he wanted for deputy surveyors, and Surveyors-General appointed them. He arranged with different persons in San Francisco to act as sureties for the deputies, such bonds being signed in blank. Oaths were seldom administered.

Evidence filed away in the Interior Department shows that Benson had co-operation and assistance in concealing from the ring's dummy surveyors the fact that contracts had been put in their names without their request, consent or knowledge. Contracts amounting to $200,000 were taken out in the names of five persons who did not discover that there were contracts in their names until two years after they had been entered in the records, and in some cases not until the thing had been exposed. The proceeds of these contracts were collected and turned over to Benson by the use of powers of attorney, signed in blank and filled up as required, which were accepted by the Surveyor-General and were forwarded to the General Land Office. Part of such powers of attorney, signed in blank, purport to have been duly executed before the chief clerk of the Surveyor General's office, acting as United States Commissioner. One of the five persons referred to was never appointed a deputy surveyor, never took an oath of office, never issued a power of attorney, and never collected a dollar, though the Treasury Department paid in his name to the Benson ring $45,000.

In 1885 Special Agent Conrad was sent out here to make an investigation, and he succeeded in obtaining evidence that caused the Grand Jury to return twenty-four indictments against Benson alone and seventy-six against "the ring."

During the seven years of his operations Benson secured contracts amounting to $989,000. But a single contract, and that for less than $3000, was taken out in Benson's name. Deducting the cost of surveys, the profits of the Benson ring were nearly 70 per cent. A paper purporting to be a settlement between Benson and one of his partners for surveys amounting to $350,000 shows a net profit of 51 per cent, and the following items of expense:

Expenses of surveys	$106,000
Paid for lobbying in Congress	25,000
Paid for blackmailers	5,000
Paid officials	17,500
Paid to attorneys before General Land Office	17,500
Total	$171,000

It was the practice of the ring to make some honest surveys under each contract, but most of the work was performed in the office and not in the field. When the Interior Department made its investigation "the ring" became alarmed and burned its records and papers. Benson went to Europe. He was arrested in Denmark and extradited. Special Agent J. A. Sibbald was sent to California in 1889 to bring the cases to trial, but, as he said in his letter to the Land Office charging collusion between the members of the ring and officers of the Government, the weakest instead of the strongest cases were tried, and the result was as he had predicted—the Government lost. Sibbald reported to the Land Office that the District Attorney at the beginning of the trial had said: "We don't want to try these cases very sharp; we do not want to convict anybody," and tendered his resignation, which was not accepted at that time.

Subsequently, in a report to the Land Office, Special Agent Sibbald said: "Of the proceeds of the contracts, amounting to $986,000, controlled by the Benson ring, I am satisfied that a proper investigation will show that not less than $750,000 was paid out of the Treasury to its agents and representatives on false and fraudulent powers of attorney. The statute of limitations now protects the forgers from criminal prosecution, but I believe the Government has its remedy by civil suits to recover the money from the men who used the bogus power of attorney, at least in the cases referred to in this report."

As the Interior Department did not act upon Special Agent's Sibbald's recommendations, he resigned. Benson's attorneys, hoping to prevent further warfare against the ring, made overtures to Mr. Sibbald, and finally engaged him to act as attorney in getting the Land Office to approve the accounts for two or three legitimate surveys. Mr. Sibbald was successful, but as his contract with Benson's representative was not in writing, it was repudiated and the fees were not paid.

After the Interior Department unearthed these things Benson and his confederates not only asked immunity from punishment, but requested payment for the fraudulent surveys rejected by the General Land Office upon proof that they were fictitious and fraudulent, which surveys amounted to from $250,000 to $400,000, according to different estimates. It is learned at the Washington Land Office that some of these suspicious claims, though it is difficult to determine how many were clearly Benson's, were settled by the last Administration upon the approval of accounts by Commissioner Lamoreaux.

To save himself from further prosecution, civil and criminal, while the suits against him were still pending Benson appeared before the Land Office in a previous Administration and suggested a compromise. He promised to have the lands surveyed again honestly and at his own expense. The Land Office agreed to this, but from new evidence in possession of Commissioner Hermann, it seems Benson did not keep his promise. However, Commissioner Hermann has entered into another such compromise, for he says: "The Government would rather have its lands surveyed than prosecute surveyors, and if they will survey them for nothing, hadn't we better let them do it?"

Nevertheless, the General Land Office is still conducting an investigation in the field. H. L. Collier, the special agent who protested when Commissioner Lamoreaux approved certain contracts, and who was dismissed for his trouble, has been reinstated by Commissioner Hermann and has been instructed to resume his old work and bring together all the evidence obtainable in relation to these fraudulent surveys. He is now supervising the surveys which Benson has been making under his compromise, and if any more crookedness is unearthed the matter will be called to the attention of the Department of Justice for action.

Commissioner Hermann believes that the Government has a chance of having its lands surveyed properly without any more expense; or, in other words, that it may get honest surveys for the money that it paid out upon false representations, but, if it has not that chance, he will bring the Benson ring to account for the past.

Benson is now with a surveying party on the Sonora road, surveying lands, and appears desirous of settling the matter with the Government by doing what it requires.

Concentrates.

THE fire in the Utica mine at Angels, Cal., is under control.

IDAHO'S State Mining Inspector has resigned to go to the Klondike.

THE Colorado Mining Stock Exchange is expected to organize under another name.

THE Calaveras *Chronicle* is publishing an application for a patent for the Gwin mine.

IT is thought that via the Stickeen will be the favorite Klondike route next year.

THE earnings of the Bolero Company, Sonora, Mexico, for the year '96 were $4,564,439.73.

THE capacity of the Treadwell mill, Douglas island, Alaska, is to be increased to 300 stamps.

THE use of a hot solution and mercury in the cyanide process is claimed by several mining men.

LEADVILLE'S "down town" mines are to be pumped out, unless silver goes considerably lower.

THE Bunker Hill & Sullivan, Cœur d'Alene, Idaho, now employs 350 men and turns out 500 tons ore daily.

A CARLOAD of miners' candles has 500 boxes, 240 candles each, and 160 boxes, 120 each—a total of 139,200 candles.

A. E. SMITH of Castledale, Utah, claims to have discovered an immense deposit of stone suitable for lithographing.

THE steamer Mariposa from Sydney and Auckland last Thursday brought English sovereigns of value $2,250,000.

IT is thought that the net cost of production of copper at the Calumet & Hecla mine last year was 5.45 cents per pound.

THE Hall Mines, B. C., smelter is now making daily shipments of copper matte to the Kansas City reduction works.

THE biggest year's yield of the Comstock was in 1876, the coin value of that year's production there being $38,572,984.

AT Grand Forks, B. C., affidavits of assessments on mining properties are being recorded at the rate of twenty to thirty per day.

THE Crocker estate, this city, are locally credited with the purchase of the Alice property, Yankee Hill, Colorado, for $250,000.

VIVIAN & SONS of Swansea are making an effort to compete with American ore buyers for the purchase of British Columbia ores.

THE Gwin Mine Development Co. are locally reported to have bought the Good Hope mine, Middle Bar, Calaveras Co., Cal., for $12,500.

AT the Gwin mine, Calaveras county, Cal., the 40-stamp mill crushes daily 130 tons $6 rock. The cost of mining and milling is about $2 per ton.

THE creation of a new Cabinet officer, the Secretary of Mines and Mining, is still a manifest necessity, and the project should receive active support.

A SCHOONER from St. Michaels, Alaska, arrived at Port Townsend last Thursday with $50,000 Klondike gold, and reports about 3500 people in that district.

THE Horn Silver at Frisco, Utah, is to be shut down. The property has paid $1,500,000 in dividends, but at present rates there is a loss on every ton of ore taken out.

THE Canadian customs department allows each miner bound for the Klondike to take in free of duty 100 pounds of provisions, miners' blankets, the clothing in use, and cooking utensils.

THE Mohave Desert Smelting Works has incorporated; H. Lang, G. W. Beck, H. T. Norcross, W. A. Off, L. Helm; capital stock, $500,000. Phœnix, Arizona, is the principal place of business.

THE Jefferson mine near Bowman's dam, Nevada Co., Cal., has been sold to New York men, who will put up a 20-stamp mill. It has been thirty years since any particular work has been done on the property.

TWENTY years ago who would have supposed that in the United States would come the time when the percentage of lead in silver-lead ore would determine whether the property could be worked at a profit?

ON the 25th inst. the ticket agent at Omaha, Nebraska, wired the operator at Trinity Center, Cal., to know what the excitement was, saying that he had sold during the past few days several hundred tickets for Redding.

THE Bonanza is the first deep level mine on the Rand, South Africa, to declare a dividend. During the year each stamp averaged 5.43 tons ore per day; 37,316 tons yielded £309,597 at a cost of £80,136; net profit, £129,461.

AT the Union Con. G. M. Co., Willand, twelve miles from Jackson, Cal., on the 25th, Mrs. Craighead, wife of the boarding house keeper, and two children were burned to death. Manager Craighead was driven insane by the loss.

THESE are great days for the dailies. It's a dull day now when a steamer from Dawson City is not sighted with three or four millions in gold aboard, or a million-dollar strike is not made in Trinity county. As a sensation it is almost as good as the Durrant case or the Fair trial.

THE Russian gold industry affords employment to 85,000 men, of which 89 per cent are engaged in hydraulic mining and 11 per cent in quartz. Of the total production less than 6.75 per cent is attributable to the latter. The yield for '96 is officially stated to be 40,991 kilogrammes.

LOS ANGELES, CAL., men are about to buy 300,000 tons Comstock tailings in Six Mile canyon, which went through the Gould & Curry mill in the '60s. Including quicksilver, it is figured that the deposit is worth $2,000,000. The buyers propose building a plant that will treat 400 tons daily.

R. A. VANCE contributes the interesting statement that "electricity in a dormant state is intense cold, and in motion intense heat." He likewise volunteers the information that "the Arctic zone is made up of solid gold." Mr. Vance seems almost crazy enough to start for the Klondike this season, but not quite.

THE nugget found Aug. 18, 1869, in the Monumental quartz mine, twelve miles north of Downieville, Sierra county, Cal., was the largest piece of gold ever found in California up to that date. It weighed 1142.25 ounces, or 95¼ pounds, cleaned, and was worth $21,156.52. It was found in decomposed quartz 25 feet from the surface.

THE annual report of the State mining engineer on the Rand, South Africa, returns shows that the industry, as a whole, is being worked at a loss. The expenditure on the mines for the last year amounts to £10,681,000, approximately, the gold produced figures at £8,603,821, the loss being practically £2,000,000. Of the moneys spent, £7,134,000 is put down to the seventy-nine producing mines and £3,547,000 to the one hundred and six non-producing mines.

RETURNS from the mill at the Horsefly mine, Cariboo, British Columbia, state that after a run of 426 hours 1192 tons of low-grade cemented gravel, which was got out in the course of development work, had been crushed. The result of the cleanup was 64½ ounces from the mill and 30 from the sluices; total, 94½ ounces gold, valued at $1602.

THE Alaska *Mining Record* closes a long relative discussion of the Skagway and Chilcoot passes by asserting that "the consensus of opinion is now that the difficulties of Skagway are less than those of Chilcoot, and they are both about as bad as they can be," being the same as saying that, whichever road the Klondiker takes, he'll wish he'd taken the other one.

AT the Golden Cross M. & M. Co., Hedges, San Diego county, Cal., the temperature is now 116° in the day and 114° at night. Seventy of the 140 stamps are crushing 240 tons of $8 rock daily. One hundred and fifty Americans and Mexicans are employed. The Americans do the mining, the Mexicans shovel, cut wood, etc. The wood is brought twelve miles and is sold by the ton—$4 per ton.

THE State Supreme Court this week reversed the Superior Court in its decision awarding John Haynes a judgment of $525.50 against Richard Chute. Haynes was employed by Chute to erect a building at a mine in Tuolumne county. Before completing the work he abandoned the job, and sued for what he had already done on the contract. He received a judgment for $525.50, which is now reversed.

A GOOD deal was said two years ago of Edison's process for the electrical separation of ores. The plan is to be given a practical test at West Portal, N. J., where "a stone building 100x500 feet and five stories high" has been built, "in which iron ore will be separated from dirt and rock by a secret process." If successful, the matter is important to Fresno county, Cal., where are large iron deposits in the Minarets.

PAPERS published on the "mother lode" indignantly deny recent published statements in the daily press that the hegira of miners thence to the Klondike occasioned a fear that mining properties in that section would be obliged to shut down. Such denials, though natural, are unnecessary; no one believed the assertions. The idea was to be sensational. In that regard the truth is the last thing considered.

THE opinion is now expressed in some quarters that the present depression in silver's price is the result of a concerted and systematic plan to buy up all the valuable silver mines, when the price will advance. Such a theory is extremely improbable; it is entitled to no serious consideration. The present deplorably low price of silver is in accordance with the law of demand, just as wheat goes up because India is not in the market as a seller, silver goes down partly because India is not in the market as a buyer.

"CONCENTRATES" is in receipt of a long private letter from Cuzco, Peru, wherein the writer, after saying he proposes to bring back the seed of the india rubber tree to sow in California, tells of some of the miners who were lured to Bolivia several years ago by tales of golden wealth. Several died between Guayaquil and Callao; some of yellow fever on the return trip; others started toward the Amazon and were lost. "Don't believe the big stories; disappointment awaits nearly all who come here," is the burden of the letter.

AFTER considerable discussion, it was tacitly settled some years ago that E. E. Matteson of Nevada City, Cal., was the father of hydraulic mining. The claim is now set up that Anthony Chabot of Oakland, Cal., was the real discoverer; that he used the first stream and built the first ditch. It does not make any great difference, but it is believed that Matteson was the first to put into practical use what is universally known as the California system of hydraulic mining, the chief distinction of which is the giant monitor.

THE usual number of inquiries regarding assessment work is received. Several seem to think because silver is down that they should not be obliged to work their claims. The equity of the thing is not under consideration. The law says that $100 in work or improvements must be annually put on each unpatented claim. On a claim located since Jan. 1st, '97, the locator has till Dec. 31st, '98, to do the $100 of necessary work. But it should be remembered that in California $50 must be so expended within sixty days after location.

COUNTY RECORDER MURPHEY of Mono county, Cal., recently asked for an order from the Superior Court to have District Recorder Lazard of the Bodie mining district deposit the records of that district in his office, in accordance with the provisions of the new mining law of California passed at the last session of the Legislature, which requires all such records to be made in the county recorder's office. The matter coming up before Judge Virden, he has rendered his decision, to the effect that the law is in conflict with the United States mining law, and is unconstitutional, null and void.

THE twenty-second annual report of the Ohio State Inspector of Mines shows that the year's coal production equaled 12,912,608 tons, a loss, as compared with 1895, of 771,271 tons; of the 12,912,008 tons of coal dug in 1896, 3,368,349 tons were dug by machinery—more than one-fourth of the total production. Five hundred and seventy-nine hands were employed to operate the machines, as compared with 447 during 1895, and 4346 hands were engaged in chuting down and loading the coal after the machines, as compared with 3374 during the year preceding.

TEN THOUSAND a year is not bad to take as a salary, added to which is another interest, locally, that will make it a round twenty thousand. That, says the Jerome correspondent of the Phœnix, Arizona, *Republican*, is the lot of the superintendent of the United Verde Copper Company, who, not many years ago, drew his $4.50 per day from the same paymaster. Others in the camp holding positions of trust are the recipients of checks, monthly, bearing figures that will aggregate from $2000 to $10,000 per annum—the latter sum to the company physician. Men get from $1.75 upwards per day, according to occupation.

THE fact that over $3,000,000 in gold was brought into the U. S. mint in this city on the first working day at that institution this month is given world-wide proclamation, with the inference that it was from the Klondike. The rest of the fact should also be stated: The mint had been closed for some weeks, counting the bullion and the transfer from old to new superintendent was going on, and meanwhile California's gold yield was accumulating; of the amount stated, about $800,000 came from the Klondike—the accumulation of a year; the remainder was the usual offerings delayed by the closing for the annual cleanup.

A LOCAL PAPER at Kaslo, B. C., says: "The Payne ore chute is believed to be the longest continuous chute of ore in the world. One tunnel is now 756 feet in ore the entire distance, and the end not yet reached. In places the ore body is 4 feet in width." In the vein of the Smuggler-Union mine, San Miguel Co., Colorado, a length of one mile has been worked along on various levels. There is one stope in that mine 800 feet in length where, in raising it, not a single point was found where the ore narrowed or grew so poor that it was left standing, while the limits of the ore chute were not yet reached. There are others.

NEXT spring a party of three will be sent from Washington, D. C., by the Geological Survey to make another investigation of the gold resources in Alaska. An appropriation of $25,000 was asked from Congress last year, but the amount was cut down to $5000. This was not available in time to send a party last season, but it will be used in dispatching three experts, one of whom will be Prof. Shurr. An effort will be made to have Congress raise the appropriation to about the same asked for last year. If this should be granted, more than one party will go. The mission is to compile authentic data on which a more complete report will be based and to make an accurate survey and geological map of the country.

THE Russian Government has issued a report on the production of platinum in Russia, according to which that country stands first in the world for that production, forty times the quantity produced by all other countries together being obtained there. In the year 1880 the quantity produced amounted to 2946 kilos; in 1895 it reached 4413 k. The production had gone on increasing up to the last year, when it diminished on account of the wet weather in summer. This metal is found in the southern Ural. The manner of its being worked up is unknown in Russia; this is done in Germany, to which country the platinum is exported in a crude state. Whatever Russia requires of worked-up platinum it has to buy back from Germany. Of late years the price of this article has run high; at present it is 900 marks (about $225) for 1 kilo of crude platinum in Russia. On mining for the platinum the still rarer metal iridium is also found, but only in very small quantities. Last year the total quantity of iridium obtained did not amount to more than 4.1 kilos.

AT Smartsville, Yuba Co., Cal., is being completed a dredger by R. H. Postlethwaite, a description of which, together with some remarks on river dredging, will appear next Saturday. Last Sunday the Allender & Co.'s hydraulic elevator at that place began work. Mr. Rother, the manager in charge, states: "When things are in proper shape about 400 miners' inches of water will be utilized and gold extracted from at least 1000 tons of deposit per day." The river bed will be explored to a depth of from 50 to 60 feet. The Postlethwaite dredger engine was steamed up for the first time last Saturday. Mr. Postlethwaite says: "Should the gravel only yield three cents per square yard the enterprise will rest on a paying basis." The machinery with a 50 H. P. engine gives a scooping capacity of 120 tons per hour and penetrates to a depth of 45 feet. Each five seconds a bucket containing 300 or 400 pounds will be dumped into a revolving screen cylinder. The fine or pay dust will fall into a receptacle, thence uniformly distributed over a set of patent rifles, while the coarser material will pass through to the dumping ground at the boat's stern.

THE Journal of the Society of German Engineers has a memoir on mining in the Upper Harz by Herr von Groddeck. The veins, which have been worked since the earliest times, yield argentiferous galena, zinc blende and copper pyrites. Water power is available. Ditches seventy-five miles in length bring the water into seventy reservoirs with a capacity of 13,000,000 cubic yards. Secondary conduits of fifty miles in length convey the water to motors aggregating 3500 H. P. The water is economized in such a way that it is led from the higher motors to lower ones, and finally to others deep down in the shafts. The various mechanical appliances used in the mines are passed in review by the author, special refereece being made to the man engines and the hydraulic engines. The new Kaiser Wilhelm shaft has been sunk vertically to a depth of 2840 feet. It has an internal diameter of 16 feet and is the first and so far the only winding shaft in the Harz with circular section and with iron tubing. The sinking was begun in 1880 and finished in 1892, the cost being £90,000. The remarkable feature is the absence of machinery from the surface, all the motors being hydraulic engines placed at a depth of 1180 feet in the shaft at the level of the Ernst-August adit. The water required is brought down in pipes from the surface and escapes through the tunnel.

ONE who locates and prospects by a tunnel under the Colorado act has a right to 1500 feet along an undiscovered "blind" vein or lode discovered in the tunnel for a distance of 3000 feet from the face of the tunnel. His right dates from the location of or the commencement of work upon his tunnel, and is contingent upon his prosecuting his work with reasonable diligence If a claim is located along the line of the tunnel the surface locator has the right to all veins, lodes and ledges within the lines of his location as against the tunnel owner to the same extent as he has against a subsequent surface locator; that is, a surface locator by virtue of his discovery of mineral in place in a vein, has thereby the right to locate so much of the surface ground and to obtain a patent thereto; by this right he also becomes possessed of all veins, lodes and ledges whose apexes are within the side lines of his claim extended downward vertically, and this whether these veins are what are called "blind" lodes or whether they appear at the surface. If his discoveries are prior in point of time to the location of the tunnel or the commencement of work thereon, he has this right although these veins or lodes may be within the line of the tunnel and be subsequently found therein. This point was not raised in the case of the Enterprise Mining Co. vs. the Rico-Aspen Co. recently decided in the Supreme Court of the United States. The point there decided was as to the title or right of possession to a blind vein discovered within the side lines of a surface location made subsequent in point of time to the location of the tunnel, the vein being a "blind" one or one not appearing at the surface, and being subsequently found in the tunnel. The court under that state of facts decided that the tunnel owner was entitled to the vein, and that he did not need to adverse the surface man when the latter applied for a patent, if at the time he had not discovered the vein in his tunnel.

Eastern Oregon Gold Fields.

Written for the MINING AND SCIENTIEIC PRESS by E. G. BAILEY.

Alaska ice is not the only cure for Klondicitis. With brows cooled by mountain breezes, and the brain fogs cleared away by the refreshing air of the coast, scores of travelers are stopping at the mining centers of Oregon and Washington surprised to know and realize that mining is not only going on, but that it is in a state of greater activity on the coast than ever before.

The following statement of the condition of mining in the portions of eastern Oregon recently visited by the writer, may serve as a guide to those desiring to see the producing mines for themselves. The mining region of eastern Oregon comprises the counties lying along the Snake river, from the north boundary of the State to about seventy miles south of Huntington. The three cities on the Oregon Railway & Navigation Railroad from which the mines are most accessible are Union, Baker and Huntington, thence by short buggy or stage rides. All of the mines mentioned are gold mines, the free gold being saved in the battery and on the plates, and the rest being caught in the sulphurets on concentrators. The concentrates are shipped in sacks to the smelters at Tacoma.

The Union-Companion mine at Cornucopia has twenty stamps in operation and a number of Frue concentrators. They are working several veins from 2 to 6 feet wide, the ore being said to run about $12 per ton. The mines are well developed and have several years of ore in sight. At the Baisley-Elkhorn mine there are two Bryan mills, having a capacity of about forty tons per day, steadily at work. Work was renewed on this mine a year ago and it is evident that there is ore enough in sight to insure steady production for at least two years to come. The Virtue mine has twenty stamps, ten being 850 pounds each and the rest 1000 pounds. The concentrator floor has about a dozen Frue vanners. In this mine they are now crosscutting at the 800-foot level to the vein, and sending ore to the mill from the stopes between the 600 and 400 levels. The vein runs from 4 to 16 feet in width and there are four good ore chutes in the claim. The product of this old reliable is from $20,000 to $25,000 per month. The ore runs in the mill from $12 to $14 per ton. The Flagstaff has an incline shaft down over 750 feet with levels and stopes started every 100 feet. The mill is an up-to-date steel mill with 1000-pound stamps, and Johnson concentrators. Owing to the fact that the shaft is sunk from the apex of a lone peak, and that the shaft is not yet to the valley level, they are not able to run the mill full time on account of scarcity of water. A little more development and this difficulty will be overcome. The vein is from 2½ to over 3 feet wide and runs about $15 per ton. Between the Virtue and Flagstaff are the Rachael down 450 feet, the Perry down 370 feet, and the Columbian and Friday near the 500-foot mark. None of these four have a mill as they propose to wait until development has secured an abundance of water for working the ore. In each of these mines the vein is from 2½ to 4 feet, and similar in character and quality to the Virtue. There are about twenty other claims developed to a depth of over 100 feet and showing good ore. Thirty-five miles west of Baker is the Cracker district, with a number of producing mines. The main lode shows ore from 6 to 30 feet in width, and has three producing companies at work upon it, the E. & E., North Pole, and Columbia. The E. & E. has a 20-stamp mill and sixteen Frue vanners. No attempt is made to save any of the gold by amalgamation, everything being allowed to go to the concentrators. The output is unknown as the Longmaids do all of their banking out of the State. It is known, however, that the carloads of concentrates are being shipped as regular as clockwork, and that the interior of the mine is in excellent condition. It is probably safe to put the product of the mill as between $25,000 and $30,000 per month. The North Pole mine is owned by the Baring-Goulds of London, who take no one into their confidence. They work about forty tons per day by the MacArthur-Forrest cyanide process, making regular cleanups and shipments. Their output is near that of the E. & E., the ore being the same, but the percentage extracted being larger. The Columbia mine has ten steel stamps of 1000 pounds each, and four Johnson concentrators. They add from $12,000 to $15,000 per month to Uncle Sam's coin. The Ohio is a parallel vein near to the big lode. This company have a 10-stamp mill, but have not run steadily owing to defects in their long water-power ditch. The mine is, however, being steadily developed. Geo. Grayson, owner of the Virtue, has purchased the Climax, near the Ohio and will put up a mill this fall. Eastern parties have just purchased the Kelly mine, discovered a year ago, and have purchased a Hammond 10-stamp mill.

The Bonanza mine, which sold recently for $500,000, is located about twelve miles east of those just described and is equipped with thirty stamps and a dozen Johnson concentrators. The mine is developed to the 450-foot level and has a lode consisting of parallel veins of quartz separated by thin layers of slate, the entire width of the ore-bearing belt or lode being nearly 300 feet. The product has been from $25,000 a month and upward for the last two years. Three miles from this mine is the Don Juan, which has been paying about $100 a day since the discovery a year and a half ago, with a small 3-stamp mill. Eastern parties purchased this two months ago for $30,000, and are putting up a 10-stamp concentrating mill. Seven miles from the Don Juan is the Red Boy with a ten ton Crawford mill, which has paid during the last two years for the property and enabled the owners to lay aside a fund which they are now using to build a 20-stamp steel mill with 1000-pound stamps and Johnson concentrators. The mine is developed to the 400-foot level and in three months more the new tunnel will reach the vein at a depth of 800 feet. The vein is from 4 to 12 feet in width and gives in the mill from $12 to $16 per ton.

Outside of the mills already mentioned there are a number of five and ten stamps scattered through the mountain regions outside of the well-known districts, among which may be mentioned the Gold Ridge mill, located near the Burnt River canyon, which has twenty stamps and four Triumph concentrators. The milling plant, however, is an old plant; and it is the intention of company this fall to replace it with an entirely new plant having 1000-pound steel stamps. The property consists of four parallel veins from 2 to 4 feet in width, developed to a depth of 500 feet.

On the opposite side of the river is the Gold Hill plant with building and power for ten stamps; but only five 1000-pound steel stamps and two concentrators are in operation. At Pleasant Valley, Sparta, Sanger, Conner Creek, Rye Valley and Mormon Basin there are small mills of from three to five stamps, which are being used to prospect and develop properties.

The geology of the mining districts of eastern Oregon is simple, as the mountain ranges have a granite core flanked on either side by several miles of highly metamorphic slates, in which are found the principal veins. In the region of the best veins the slate formation is cut by dikes of porphyry and diorite, many of the veins being contact veins between the dikes and the slates. All of the veins are well defined, cutting the formation at an acute angle and have a clear selvage or gangue. It is worthy of note that nearly all of the producing mines of eastern Oregon have passed, within the last three years, into the hands of experienced superintendents and operators. In fact, many of them are but the revival of old mines that were abandoned fifteen or twenty years ago.

Eastern Oregon was settled by placer miners in '62 and '63, and from that time up to the present date these placers have yielded a good annual revenue, and will continue to do so for a decade or more to come. But few of these miners have ever had any knowledge of quartz, the result being that the quartz lodes were only developed superficially; and it was not until three years ago that deep mining proper was started. Now the Virtue, Flag Staff, Cornucopia, E. & E., North Pole, Columbia, Gold Ridge and others have reached a depth of 700 feet, while two score or more are down 500. In every instance the mines show a good quality of ore at the lower levels, and all those who visit the region will be convinced that the mines are permanent and may be expected to continue to the limits of mining economy.

JUNCTION MINE, LOUISE CREEK, OREGON.—(See page 189.)

Rice Growing in Japan.

Herewith is the latest of the series of views showing the handling of the plow primeval from Egypt eastward through Arabia and India to the very sunrise of Asia on the islands of Japan. In all these lands of the yesterday are found picturesque but ineffective implements and practice, and it is only a matter of time when improved American implements will supplant the rude appliances which have ruled in Asia since the birthday of the race. Of course there are local conditions and needs which require inventions of special character and local fitness must be the final test of every tool. Improved tools may not suit all purposes, but the elevation of labor all over the world depends upon the employment of the same progressive spirit, the same understanding of materials and high inventive skill which rule in the most enlightened nations.

Herein is seen the Japanese black water ox and the bare-legged plowman. English-speaking people do not grow rice in the Asiatic fashion, nor is it at all necessary to paddle around in a mud-hole as this

PREPARING LAND FOR RICE WITH WATER OXEN, IN JAPAN.

man is doing. Possibly it is necessary there where the population is so dense that the river beds must be made to yield produce; possibly it is not practicable to regulate the spread of the water to the times when the plant actually needs it, but there is certainly a more rational way to grow the crop; and where human time and comfort are worth anything, other methods are employed.

And yet Japan has a wonderful record in rice growing. About 6,500,000 acres of land and water has been used for the rice crop, of which a valuation of $202,521,750 is computed on a basis of a total product of 180,000,000 bushels—the average product being about 30 bushels to the acre. Four or five acres of lowland rice fields form quite a respectable holding for one person. This with another acre or so of upland, where vegetables are raised, and a little bluff land for timber, fuel, and grass to feed the pack horse, supports his family, pays for hired help and gives a little surplus at the annual settling day.

The homes of the rice, silk and tea farmers are the best of all the agricultural laborers of Japan. The houses are often as large as 30x40 feet, universally one story, thatched roof, strongly built, with veranda in front, and five or six rooms.

How is the Japanese able to maintain such an establishment on such a small piece of land and water? It is by "keeping everlastingly at it." He pays the Government $5 per acre taxes and 50 cents per acre besides for local taxes, or about 3 per cent on the value of his land. He practices the most intensive culture; grows his rice seedlings and transplants them by hand; he makes the utmost use of every particle of fertilizing material and every inch of land, and he lives within his income. There are certain most excellent economic principles involved in his operations, and yet his life is hardly human. He is ground down into the mud in which much of his daylight hours are passed. Contemplation of the industry of barbaric nations is depressing. It is well, however, that one-half of the world should know how the other half lives. It may make people more contented to mark the superiority of their own environment, and it may also reconcile them the more to the self-denial and plodding from which even the highest civilization gives no emancipation.

Around Leadville, Colorado.

Written for the MINING AND SCIENTIFIC PRESS by W. A. SCOTT.

The recent slump in the silver market has intensified the depression so long felt in Leadville, especially among the operators of mines in which silver largely preponderates. What are known as the down-town mines, such as the Penrose, Bonair, Coronado and Welden, which are in the main silver producers, have been closed down and filled with water since the time of inauguration of the labor troubles a year ago. The unwatering of these mines will similarly benefit many other adjacent properties. As has been stated before, an arrangement was effected some months ago whereby all the down-town mines were to contribute their respective portions to a fund to put in new pumping plants and empty the mines of water. In consummation of this plan the new pumps were purchased and, I believe, are on the ground, but as yet no move has been made to place them in position for work. The re-equipment of the down-town properties would not only result in adding heavily to the output of the camp and to the employment of labor, but would have a stimulating effect on the camp generally, because these mines are owned by some of the most thorough-going and responsible operators of the State. It is suggested by some that the hesitancy of the combination about setting the great pumps to work is due to the discouraging outlook for the silver market.

Some distance above the down-town group are such mines as the Wolftone, Mahala, R. A. M., Emmett and Mikado, which in earlier years produced carbonate ores, but are now worked through that formation into an iron sulphide, carrying silver, gold and some lead. It may be observed that the carbonate ores, so far as the developed mines are concerned, are pretty well worked out. The smelters here do not get from the home camp the supply of lead ores that they would like to obtain. This is not saying that the lead ores of the district are exhausted, for the district encompasses a large area, much of which has not been thoroughly prospected.

The ores rich in iron manganese now constitute an important factor in the shipments from the camp, and are produced from such mines as the Catalpa, Crescent, Yankee Doodle, Morning Star and Bison, on Carbonate hill.

On Breece hill, still farther up toward the crest of the Mosquito range, are the mines of the gold belt and include such as the Little Johnny, Ibex, Resurrection and Sedalia. These produce siliceous ores, whose values are about one-half in gold and the other half in silver and lead. The Johnny and Ibex group is the scene of very active operations, about 400 men being employed there at present. The work goes on from six different shafts, ranging from 500 to 700 feet deep. The newer of these is rapidly sinking and is to be sunk to a depth of 1400 feet. Much of the ore from this property is oxidized, but at greater depth it becomes more of a sulphide, with proportionately more silver.

The Resurrection shaft is down 900 feet, from which there is an output of about sixty tons per day. The Sedalia, adjoining it, is running with a small force of men.

In California gulch, where the original discoveries were made, are the Yak mine and tunnel, the A. Y. and Minnie, the Col. Sellers and others. The first-named is operating with a considerable force. The Col. Sellers and A. Y. and Minnie were enormous producers in the earlier and palmier days of the camp, and all along this historic gulch are plant after plant of machinery, whose wheels for years turned out riches, but which gradually became silent as the depression in the silver market came on.

The recent starting up of the Elgin smelter has attracted considerable attention in the camp. It is under the superintendence of Marcus Ruthenburg, who is employing there a process which, it is claimed, is successfully treating the zinciferous ores, of which there are thousands of tons on the dumps at various mines. By this process the zinc is eliminated and the silver, lead and iron saved. Mr. Ruthenburg's treatment of zinc ores recently resulted as follows: Zinc, 25 per cent; iron, 20 per cent; lead, 3 per cent; sulphur, 35 per cent, and 10 ounces silver. He asserts that this is a fair sample of thousands of tons

to be had in the camp. The Elgin is treating about fifty tons per day with one furnace, and two more furnaces are to be put in.

The Bimetallic smelter, after having been closed down several months, started up last June under the management of Franklin Ballou, and is treating about 200 tons per day of siliceous sulphide ores, the product being a copper matte, containing principal values in gold and silver. A feature of the Bimetallic plant is an arrangement for condensing the volatilized material carried over the draft. By this method all the lead and other material of value are saved.

The Arkansas Valley smelter is operating with full force and doing a large business as usual.

It is estimated the camp is producing about 1400 tons per day, which does not vary greatly from the output as it has ranged for the past year.

Even should the down-town mines be slow about resuming, and even if the camp has seen its best day as a producer of carbonate lead ores, there is every evidence that the district is widening out, and as the sulphide strata of Breese and adjoining hills continue to be delved into, it will be seen that the greatness of the district will in no wise decline.

Leadville, Colo., Aug. 14, '97.

THE South African *Mining Journal* is informed that Messrs. J. S. MacArthur and Alfred James have entered into partnership as mining and metallurgical engineers in Glasgow and London. Mr. MacArthur has retired from the managership of the Cassel Gold Extracting Company, which reminds that journal that lately the correct history of the cyanide process on the Rand has been incorrectly stated in several places. In the middle of 1890 an experimental plant was erected at the old Salisbury battery to test the general efficacy of the process. This plant was under the direction of Alfred James. The patents were taken out by the African Gold Recovery Syndicate, who made a contract with the Robinson Gold Mining Company to treat 10,000 tons of tailings. Invitations were sent out to gold mining companies to treat amounts varying from one to ten tons, and between twenty and thirty companies accepted the invitation. The experiments were finished in November, 1890. Then Mr. Darling took over the works from Mr. James with the object of testing the commercial value of the process; and when the Robinson directors failed to come to terms with Mr. James, Mr. Darling took charge of their plant, which was started on December 23, 1890, and was the first to treat tailings on a commercial basis.

Mines of the Gold Belt.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS, M. E.

Having in the first paper of this series given a general sketch of the geology and mines of the southern end of the gold belt, we will now turn to the section immediately adjoining it on the north.

Mariposa County.—It is here that that particular portion of the gold belt known as the mother lode has its southern termination, by which I mean that south from the southern part of Mariposa county the mines are entirely different from those found northwestward along the lode. The inclosing rocks are for most part different; the quartz is dissimilar, and every feature changes, but just what mines to include within that comprehensive term, "mother lode," and which ones to relegate to some other lode or to isolate from all others, it would be difficult to determine.

There is a great lode or vein in this county which extends northward through Tuolumne county and into Calaveras, having its northern terminus at Carson Hill, five miles southeast of Angels. Of all the numerous veins, this particular one is most prominent and has such peculiarly distinguishing characteristics as to entitle it to some distinctive name which will serve to identify it and set it apart from all others, and yet this great vein is only the main fissure of a greater fissure system. Some of the branching veins and accompanying parallel mineralized zones are far richer than the main lode. I shall call this great fissure or vein the dolomite vein.

The Dolomite Vein.—The distinguishing features of the dolomite vein are its enormous width in places; its remarkable and almost unbroken continuity from Bridgeport, Mariposa county, to Carson Hill; its very frequent association with serpentine and the unusual mineralogical composition of the vein.

This latter feature is the most pronounced and is really the principal feature by which it may be distinguished from other great veins. I consider this great vein as of eruptive origin—that it is, in fact, a dike of unusual length and width, the minerals of which have been altered. As we find it to-day, it consists of a great mass of carbonate of lime and carbonate of magnesia—dolomite, in fact. In some portions carbonate of iron also occurs, the combination then forming the mineral ankerite. Those portions containing carbonate, when unaltered, cannot be distinguished from the more abundant dolomite. Where not oxidized or affected by dynamic agencies, the dolomitic mass is pure, glistening white. It is comparatively soft and can readily be distinguished from quartz. Usually throughout the mass, whether it be 3 feet wide or 100 yards across, is scattered in greater or less profusion a beautiful grass-green micaceous mineral called mariposite. It is also often found disseminated in the massive quartz of the lode. Though so abundantly distributed in the great vein, it always occurs as disseminated scales, and never, as far as I have observed or heard, in massive form, not even as an aggregate of scales.

Quartz occurs in the dolomitic vein in great vein-like masses, and not infrequently it is gold-bearing, and a few instances are reported where the dolomite-mariposite mass is also auriferous. In the Rawhide mine, Tuolumne county, a small strip was found extremely rich in gold.

In many places the great croppings of the lode have become oxidized, the decomposing iron carbonate and more or less abundant pyrite forming great quantities of iron oxides (principally limonite, though hematite is also abundant), which stain the vein material and adjacent rocks deep red or brown. In some parts of the lode this oxidation extends to considerable depth, while in others it is merely superficial.

The Formations of the Vein.—The dolomitic vein is found in contact with a variety of rocks, the most common and important being the black clay slates slates of the mariposa beds. Basic rocks of various kinds are abundant, particularly diabase and diorite and amphibole schist, the latter being either altered

THE WHITLOCK MINE AND MILL, MARIPOSA COUNTY.

THE OLD MARIPOSA MILL.

CROPPINGS OF MARIPOSA VEIN.

THE MAY ROCK, MARIPOSA COUNTY.

diabase or diorite. Gabbro and serpentine also occur abundantly. That the character of the wall rocks has any influence on the value of the vein I am not prepared to say, though inclined to believe that it does not.

The comprehensive idea of the character of the dolomite vein and of other mines of the gold belt may be obtained, perhaps, from a description of the larger veins which seem to present typical features.

The Mariposa Vein.—In the southern outskirts of the village of Mariposa is this once famous mine. It is said to be a pocket mine, though I am credibly informed that a large amount of quartz was crushed in the mill, now fallen into decay, which stands on the banks of Mariposa creek near the mine. The vein crops along the surface for a long distance and is from 2 to 10 feet wide. The quartz is white and brilliant and frequently beautifully crystallized. Crystallized quartz is usually considered a sign of a pocket mine in this portion of the gold belt. Following the Mariposa vein southward, it crosses Stockton creek and strikes in the direction of Big Spring, near which a strip of slates and schists extends southward in the grano-diorite toward Grub Gulch. From the main shaft northward the vein is found to split into several branches; to become smaller, and finally it is impossible to positively identify it longer.

This vein occurs in a typical diorite-porphyrite, a dark greenstone of fine grain, with numerous well-formed white crystals of feldspar scattered through it. As far as observed by me, this rock formed both walls, but in depth I believe slates occur on the east wall.

The Mariposa mine is nearly two miles east of the dolomite vein, and has no apparent connection with it.

The dolomite vein might be considered as having its southern terminal near Bridgeport, on the west side of Buckeye creek, where a large mass of quartz crowns a hilltop. It is not gold-bearing, or at least only slightly so.

The first mine of any importance found on the dolomite vein northward from its southern end is the Mount Ophir mine.

Mount Ophir Mine.—In the early days of the Mariposa grant this was one of the most promising mines in this section. It has been idle many years, as have all the mines on this vast estate. The wall rocks of the Mount Ophir vein are not the same throughout. The upper part of the vein is found in walls of talcose slate (altered from diabase). In the lower tunnel serpentine is found on the foot wall. The dolomite vein here is small and much decomposed or altered to a talcose rock. The quartz lies on the west or foot wall side of it. A short distance east of the Mount Ophir, in the bed of the creek, may be seen a stratum of clay conglomerate, the pebbles of which are much flattened by the shearing of the rock.

From this locality northward to Merced river, a distance of ten miles, the ankerite vein and its branches follow the black clay slates of the Mariposa beds, being sometimes associated with them, but as frequently with the amphibolite schists and serpentine. These formations for most part constitute the floor of Bear valley, a depression having an average width of about two miles, and lying between two mountains of hard, granular diabase—Mount Bullion on the east and Bear mountain on the west. These rise from 1500 to 2000 feet above the valley, the diabase being much harder than the slates, schists and serpentine, and consequently resisting the erosive agencies which have carved out the valley. The great vein courses along the central part of the valley, though near the village of Bear Valley approaching more closely to Mount Bullion. On both sides of the valley several pocket mines were opened and worked many years since. These occur mostly at or near the contact of the black slate with the diabase. Some of these are reported to have yielded large amounts of gold.

The Princeton Mine.—This once famous property is situated a short distance southwest of the Mount Ophir mine, and, though quite different from the latter, seems to belong to an extensive system of fissures which are doubtless connected directly with the dolomite vein. The Princeton mine has been idle many years, but is reported to have produced more than $4,000,000 in gold. The deepest workings are only about 600 feet from the surface. It is nearly parallel with the dolomite vein, dips like it to the eastward, the angle varying from 45° to 75°. The inclosing rock is black clay slate on both walls. The vein is accompanied by a light-gray dike rock of fine texture. Near the surface this dike is in the hanging wall slates, but I have been told that in depth it came in contact with the vein and crossed to the foot wall side. The vein has a curving strike, which conforms, as far as may be seen, with the slates. The slates, however, stand nearly vertical. The percentage of sulphurets in the quartz was small, and the rock, generally speaking, free milling, a fact attested by the low grade of the large tailings dump. West of the Princeton is an intricate fissure system of gold-bearing quartz veins, both large and small. Some development work of superficial character has been done on some of them within the past year or two, but too little to make it possible to determine their relations to each other. The entire region of the immediate vicinity is so thickly strewn with quartz float as to make it difficult to tell from which vein any particular piece may have been derived.

The dolomite vein is not continuously prominent throughout Bear valley, but here and there comes to the surface, usually showing the dolomite with its accompaniment of mariposite and vein quartz. Some of these quartz croppings are often of great size and form objects of more than passing interest in the landscape. Among these the most prominent is known as the May Rock.

The May Rock.—It is a huge mass of quartz about 150 feet in length, over 80 feet in height and about 20 feet wide at the base, and it stands like a portion of a massive wall now falling into decay, towering silent and gloomy over the pine trees which grow about it. The quartz is auriferous, but so slightly that it is not at all probable that it will ever be broken down and crushed in a mill. This interesting rock is about two miles south of the village of Bear Valley, and on the west side of the road to Mariposa.

The Whitlock Mine.—This mine, owned and operated by the Sierra Buttes Company, is located five miles north of Mariposa, on the east side of Mount Bullion. The hanging wall is chloritic schist, the foot wall diabase. The vein has a somewhat sheeted structure. It has been opened quite extensively by the present owners. There are a number of prospects in this vicinity, large and small, the walls being greenstone and its altered products (talcose and chloritic schist). This district is about four miles east of the dolomite lode, and has no characteristic in common with it.

East of the dolomite lode a distance of eighteen to twenty miles is the east lode. The most important mine thus far developed on this lode in this county is the Hite mine, which will be described in the next article.

Soulsbyville, August 24, '97.

Mercur District, Utah.

Written for the MINING AND SCIENTIFIC PRESS by a Staff Correspondent.

Prevailing conditions at Mercur are brighter than they have ever been in the history of the camp. There is very little speculation and not much excitement, but the business of actual mining and development is progressing with a degree of confidence not heretofore exhibited. During the past thirty months the Mercur, Marion-Geyser, Sacramento and others have produced snug fortunes, and recently such as the Northern Light, Chloride Point and La Cigale have developed into good properties; but during all this time some degree of uncertainty prevailed in the camp, not as to the continuity or richness of the ore bodies but as to the methods required for treating any and all classes of ore found at various depths and under various conditions.

The Mercur mine, whose workings started pretty well up toward the apex of the ledge, and which are following the dip to the northeast, contains a class of ore which thus far has yielded readily to the least expensive form of cyanide treatment—in fact, it has proved to be an ideal ore for this method. The ores of the Marion-Geyser, on the opposite side of the gulch from the Mercur, seem very similar to those of the latter, being porous and soft in texture and free from substances which interfere with the cyanide work.

But the very extensive developments on the Golden Gate, on which the ledge was tapped by shafts at about 1500 feet greater dep h than the workings in the Mercur, revealed in places a class of ore which was not strictly "free-milling," as applied to the Mercur cyanide method, containing as it did a small percentage of arsenical and sulphurous material which made it non-susceptible to cyanide treatment. While the work of development and blocking out ore has gone on in the Golden Gate for the past two years to the extent of making it the most thoroughly developed mine in the district, a thorough system of experiments and tests have been carried on to determine precisely the processes to be employed in the mill in the meantime being planned. The management unquestionably has been fully satisfied for many months as to the methods to be adopted, but the uncertainty was felt by the people of the district, who construed the delay of the Golden Gate people as implying a doubt as to their ability to handle the low-grade, refractory ores. But now that the work of constructing one of the largest reduction works in America on the Golden Gate grounds has actually commenced, the effect in the camp is very favorable because it is considered that the most difficult problem of the camp has been solved and that should other property owners encounter ores similar to those on the Golden Gate they will no longer hesitate in developing their mines or building mills. It is possible that the mines adjacent to the Golden Gate may strike strata of the same arsenical ore when they reach the same depth as that now reached by the Golden Gate.

The new Golden Gate mill, being constructed under the superintendency of Mr. Daniel C. Jackling, will be a modification of the cyanide process, which will include some original features. For the purpose of handling the arsenical ores a roasting apparatus will be put in, which will be a type of the straight-line mechanical furnace. Mr. Jackling explains that by far the larger proportion of Golden Gate ores are oxidized and can be cyanided without roasting.

The new mill will be steel in structure and will start with a capacity of 500 tons per day, with provisions for 800 tons, and will have a roasting capacity of 400 tons per day. Contracts are let for much of the work and it is understood that the plant will be finished before the end of the year.

In the Mercur mine the work of development and blocking out ore goes continually on, the work being carried on through two inclines 700 feet apart. From the inclines there is a drift every 100 feet, with a crosscut from drift to drift in such a way as to leave the ore in blocks 100 feet square. In all, the mine contains about eight miles of drifting. In many places the ledge is 35 to 39 feet thick, and developments extend along the strike at least 1000 feet. The timbering, which is very extensive, is put up in square sets. A force of about 100 men is employed in the mine and about thirty at the mill. Last February, prior to the expiration of Capt. DeLamar's option on the Mercur, his expert estimated there was ore blocked out of the value of $1,008,000, and as much additional ground has been blocked out since, it is claimed there are the same values in sight to-day.

The Sacramento, which joins the Mercur on the west, is mining and milling about 100 tons of ore per day, which runs in value from $8 to $10 per ton.

That portion of the district known as the west dip is making very substantial progress. It is that region facing Rush valley in which the formation dips from 32 to 50 degrees and toward the west, the veins on the Mercur and Golden Gate side of the range dipping in the opposite direction. On the west dip are the La Cigale, Omaha, Daisy, Gray Rooster and others.

In the La Cigale the underground development is mainly through an incline which is sinking on the vein and which is now at a depth of 350 feet. From the incline two 500-foot drifts have been driven, one to the discovery shaft 500 feet to the south. Other drifts are in progress, making approximately 1500 feet of work outside of the main incline. In this property the ledge, which stands at about 45 degrees, dips into the valley and averages 10 feet wide. The ledge is traceable along the foothills for a distance of fourteen miles, of which the La Cigale has 3000 feet along the outcrop and 4800 feet with the strike of the vein. At the hanging wall there is considerable talc, but the bulk of the vein matter is oxidized and well suited to cyanide milling, and lies between strata of dolomite lime. The values will average about $6.50 per ton.

The La Cigale mill is nearing completion and will doubtless be in operation in September this year. It will have a crushing capacity of 500 tons per day and a leaching capacity of 200 tons. There are two sets of crushing rolls and it is the intention to crush the ore to a one-half mesh. The material will be handled automatically throughout. After crushing, the ore is carried by scraper conveyors to V-shaped bins, from which it is drawn into steel leaching tanks of 6x16x4 feet dimensions. These tanks are hung on trunnions and after the leaching they are inverted, by which the tailings are dumped into V-shaped bins beneath and carried thence by another set of conveyors to the dump. The entire arrangement is such as to dispense with handling the ore by hand and to run with the utmost economy. The management estimate that they will be able to mine and mill the ore at a cost of $1.50 per ton. A water supply is being piped in from Ophir creek, five miles to the north. The La Cigale is largely owned by Robert B. Blodgett, John Murray Marshall, Henry S. MacKay and George Dickson of Boston, Mass., and C. H. Scheu, C. H. Shaw, T. Ellis Brown and Mr. Cheeseman of Salt Lake, Utah. Geo. A. Packard, formerly of Montana, will be mill superintendent.

The Daisy, a short distance south of the La Cigale, has some good developments and its management has decided to erect a cyanide mill this fall.

The Northern Light mine and mill are at an altitude of 8600 feet and lie midway between the La Cigale and the Marion. The mine is really on the west dip zone. The vein is tapped by means of tunnels which cut it at 1400 feet depth. This property produces high values in silver, the ore carrying which is shipped direct to the smelters. The cyanide mill, by which the lower grade gold and silver ores are extracted, will soon be provided with twenty-four leaching tanks, making a capacity of 200 tons per day. These tanks are 20x12x5 feet, constructed of steel.

The Chloride Point, situate on the opposite side of the mountain from the Northern Light, produces practically the same grade and character of ore as is found in the latter.

Mercur, Utah, Aug. 10, '97.

Mechanical Progress.

The Suction Pipe and Its Correct Size.

No other piece of machinery in a mill or factory is subject to so much abuse and charged with so much unnecessary expense for maintenance and repairs as the steam pump, owing in a great measure to the fact that the average engineer does not thoroughly understand its construction and functions. When he knows that a steam pump has nothing whatever to do with forcing water through the suction pipe into the water cylinder, he will be in a better position to properly care for and run a steam pump.

Take from any manufacturer's catalogue a single direct-acting steam pump, with a water cylinder 6 inches in diameter and 12-inch stroke, and located at the mouth of a cistern open to the atmosphere: assuming that the vertical distance from the surface of the water in the cistern to the top of the water cylinder is nearly 34 feet, that the pump and its appendages and connections are air-tight, and that there is a gate valve attached to the lower end of the suction pipe—say, 1 foot below the surface of the water—and which can be thrown wide open in an instant, then the water cylinder and suction pipe both full of air and the gate valve closed tightly, start the pump, and after two or three strokes, or a sufficient number of strokes to exhaust all the air in the pump itself and in the suction pipe, stop it. So far the pump has not handled a single drop of water, having acted only as an air pump; there is a perfect vacuum both in the water cylinder and the suction pipe; now throwing open the gate valve instantaneously, the water in the cistern 34 feet below the pump barrel rushes through the suction pipe and into the pump barrel, filling the same and the suction pipe clear down to the gate valve, a column of water nearly 34 feet high supported by the atmosphere, whose pressure is 14.7 pounds upon every square inch of water in the suction pipe, whether the pipe contains the fraction of a square inch in its diameter or a hundred square inches. A column of water 1 square inch in area and nearly 2.3 feet high weighs one pound, and $14.7 \times 2.3 = 33.81$ feet, or 34 feet nearly.

This is taking for illustration an ideal pump, a perfect vacuum pump; such pump is never met with in practice, because air is an insidious element, ever on the alert to destroy a vacuum, and because it is impracticable to make the water end of a steam pump tight; and if it were made so, air would find its way into the water cylinder through the suction pipe, since the water itself contains air.

One can regulate the steam pressure to force the water out of the pump barrel at any velocity within the bounds of reason, but have only the pressure of the atmosphere to force it into the water cylinder; consequently one must regulate the velocity to suit the pressure. The theoretical velocity of water rushing upward through the suction pipe is found by taking the square root of the acceleration due to gravity multiplied into the head in feet. The head due to a pressure of 14.7 pounds per square inch is 6.4 feet, nearly; thus $14.7 \times 0.433 = 6{,}365$, $\sqrt{2 \times 32.2 \times 6.4} = 20.3$ feet per second, or 1,218 feet per minute. But this velocity is reduced by the effect of entrance head, by the weight of the water in the suction pipe, and by the resistance of friction in the suction pipe. To illustrate, take the catalogue pump, 6 inches in diameter water cylinder, and 12-inch stroke. The area of the water piston is 28.27 square inches, and $28.27 \times 12 = 339.29 \div 231 = 1.4688$ gallons of water per stroke of piston. Again, $339.29 \div 12 = 28.27$ feet per stroke, or a column of water 1 inch square and 28+ feet long. If the pump is run at a 100-foot piston speed per minute and the suction pipe is 1 square foot in area and 25 feet long, the pump will not work, because the velocity of the water flowing through the suction pipe is 2827.44 feet per minute, equivalent to 146.88 gallons of water per minute, and the friction loss in pounds of pressure per square inch will more than equal the pressure of the atmosphere, admitting that a perfect vacuum obtained in both water cylinder and suction pipe. It is not necessary to go into figures to show that a suction pipe of 1 square inch area is too small for a 6-inch x 12-inch water cylinder; merely making use of a few figures to show why it is so.

Authorities say that the velocity of the water in the suction pipe should not exceed 250 feet per minute. Looking again in the pump catalogue, it is found that the manufacturer has given this pump a suction pipe 4 inches in diameter. Figuring again, there is $4 \times 4 \times 0.7854 = 12.5664$ square inches area of suction pipe and $2827.44 \div 12.5664 = 225$ feet per minute velocity of water flowing through the suction pipe. The friction loss consequent upon 146.88 gallons of water flowing through 100 feet of 4-inch pipe, according to Ellis' tables, is about 0.69 pounds per square inch; but this suction pipe is but 25 feet long, consequently take one-fourth of this, or 0.1725 pounds per square inch as friction loss. One may lower the pump and shorten the suction pipe or increase the diameter of the suction pipe and reduce the friction loss to practically nothing.

It is plain that there is no such thing as suction, and that vacuum does not draw the water into the water cylinder. Suppose that the vacuum in the pump is impaired to the extent of 4.7 pounds per square inch; there should then be but 10 pounds of atmospheric pressure per square inch to force the water up through the suction pipe; thus $14.7 - 4.7 = 10$. By proportion, $14.7 : 10 :: 34 : 23.13$. Consequently it is necessary to lower the pump nearly 2 feet in order that the atmosphere could force water into the water cylinder.

Take a pump running at a piston speed of 150 feet per minute, with a suction pipe 20 feet long vertically, and if the net atmospheric pressure is just sufficient to keep the water cylinder amply supplied, the steam pressure may run the pump up to 175 feet per minute, and thereby increase the quantity of water delivered per minute, providing the supply does not break. But the supply would in all probability break, because of the increased resistance of friction in the suction pipe consequent upon the increased velocity of the water, without any increase of the pressure of the atmosphere.

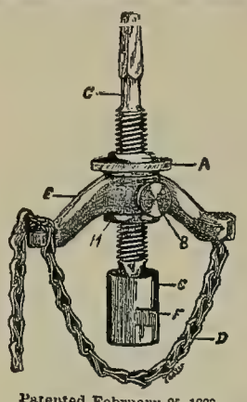
Of course, if one could increase the pressure of the atmosphere at the same time that he increased the speed of the pump, all would be well; but this cannot be, since the pressure of the atmosphere is a constant and unchanging quantity at the level of the sea.

It is believed by many that a steam pump such as is being considered will not handle hot water unless the water flows to the pump by gravity. There are steam pumps on the market that handle hot water having a temperature of 200° Fahr. successfully, with suction pipes as much as 18 feet long vertically. This can be done with a piston pump and very little piston clearance. Suppose a hot well open to the atmosphere and holding water at 153°. The total pressure per square inch due to this temperature and measured from a vacuum is 4 pounds. The weight of water per cubic foot at 153° is about 61 pounds. Then $14.7 - 4 = 10.7$, and $61 \div 144 = .4236$. Then $10.7 \div .4236 = 25.2 \times .8 = 20.16$, or say 20 feet for the vertical lift of water.

It is well to always place a vacuum chamber on the suction chamber close to the pump, and when the suction pipe is very long or has numerous fittings and valves in it, a vacuum chamber becomes indispensable. When the suction pipe is very long a foot valve is also necessary. The vacuum chamber being constantly filled with water, when by reason of speeding up the pump the water piston runs away from the inflowing water through the suction pipe, causing a break, a portion of the water in the vacuum chamber at once falls down into the suction pipe, filling the gap and restoring the continuity of the body of water flowing to the pump. In time air will collect in the vacuum chamber to such an extent as to resist the entrance of any considerable quantity of water, and it must be expelled either by drawing it off through the pump or by a small air pump attached to the top of the vacuum chamber.

Automatic Drilling Attachment.

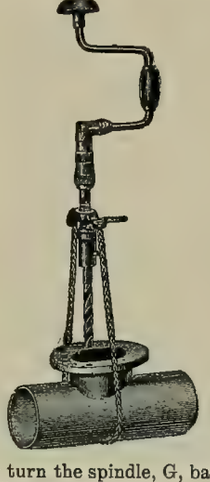
This tool will do a great many jobs that would require much time and expense in taking down and putting back if done on a drill press. It requires no



Patented February 25, 1896.

pressure by the operator to make it cut. The chain does that part of the work. Holes up to three-quarter inch can be drilled with ease, and with no danger of springing the brace with heavy pressure. It will, in many cases, take the place of the ratchet drill, and can be quickly adjusted ready for use. It is useful in mine repair shops, millwrights, machinists, engineers, structural iron workers and general construction work.

The mode of operation is simple. In



starting turn the spindle, G, back close to nut, H; pass the chain around the piece to be drilled, and draw it tight. The screw, B, is to adjust the feed, and should be loose when starting. Holding the hand under and against the wheel, A, at the same time turning the brace, will cause the drill to come into cut, when adjusting screw, B, can be turned down until the required feed is obtained.

A DIVING BELL devised by W. G. Smith is of steel 8 feet high 18 and feet around; is fitted with a telephone and electric light; the light is upon the outside of the bell and illuminates the bottom of the sea for some distance, the diver looking through heavy windows in the sides of the bell. In a late experiment six men went down in the machine to a depth of 250 feet in Lake Michigan, off Milwaukee, and remained at the bottom of the lake six hours. This diving bell will be taken by its owners across the ocean, where an attempt will be made with it to reach the remains of the German Lloyd steamer Elbe, which sank off Lowestoft, Jan. 30, 1895, shortly after she had started on one of her regular trips to New York.

Scientific Progress.

Scientific Prospecting.

NUMBER II—CONCLUDED.

By THOS. SMITH.

As all igneous rocks carry a large percentage of silicon, or silicic acid, we find that the greater number of these fissures are filled with quartz deposited from these aqueous solutions, as the disintegration of the eruptive rock would free the mineral in it—we find that the minerals are embodied in the quartz. In this connection it should be stated that the last outflow of any eruption is the most valuable. This is caused by the fact that the molten bodies of highest specific gravity are nearest the vent when formed, and are naturally ejected first. Of course, this need not be the case with permanent craters, as between the times of their eruption time would be allowed for the different fluids to resume their normal relative positions. This last overflow is generally ejected from one side of the crater only, the wall being generally irregular in its outline, allowing the mass to pour from the lower portion of the rim, and frequently, its specific gravity being so much greater than the preceding flows, it displaces the semi-fluid cooling mass, and traveling in a trough of its own construction therein forms dikes of different eruptive rock.

The facts we want to observe most thoroughly are in which direction the last overflow traveled from the crater fracture, and whether the mineralized eruptive rock has since been covered with sedimentary rocks. If the overflow is the upper stratum of the earth's crust, we shall find the quartz deposits on the line of the dikes the richest ores, but still not nearly so rich as the quartz formed in the mass and on the contacts of the primary dike still remaining at the crater fracture.

If we find that the eruptive blanket overflows have since been covered with sedimentary rocks, we should determine as nearly as possible the direction of their flow, and can then predict with reasonable accuracy that paying ores can be reached in any one of the blanket deposits and on their lower contacts at a given depth. Where large quantities of limestone lie above ore deposits, we may expect the concentrates in the fissures to be the spar formation. Where limestone is absent, we may expect to find quartz, but, whether spar or quartz are found, the veins will be barren unless the eruptive rocks in the vicinity have borne the minerals from the interior of the earth.

A great amount has been written about the different eruptive rocks, which ores may be expected to carry mineral and which not, and they have also been classified as mineral and non-mineral bearing by their color. This is also a theory based on guess work, and will not prove correct in a great many cases. The ability of a melted rock to float, and retain gold in proximity to the earth's crust so that it can be ejected from a vent, depends not upon its color or the presence or absence of any particular characteristics, but upon its specific gravity alone, and one of the surest indications that we can have that gold can be found in an eruptive rock is the presence of crystals of magnetite in its mass.

California Asphalt.

At the Las Conchas asphalt mine and asphaltum works on the seashore at Carpinteria, the mine has a body of bituminized sand covering about seventy-five acres, and estimated to average more than 25 feet in thickness. This sand is soaked with maltha from the bituminous shale on which it rests. The process of mining is a simple one. The surface loam, from 6 to 8 feet thick, is washed away, and a thin bed of yellow clay is removed, exposing the sand. This is dug up with hot spades, and carried up an incline in cars to the refinery. There it is dumped into a mixer, or steam-jacketed cylinder, in which revolving arms break up the

lumps. From this mixer the mass falls into vats of boiling water, where the sand settles to the bottom and the maltha floats. The sand is removed by worms and a bucket conveyor, while the maltha, which is called crude flux in this condition, falls through a flume to a tank, and is finally pumped to an elevated storage tank. From this tank it runs by gravity into two refining kettles of fifteen tons capacity each, and is kept for twenty-four hours at temperatures rising gradually from 100 deg. to 240 deg. Fahr., to drive off the water and light oil. The maltha is now called refined flux, and is carried by steam-jacketed pipes to the mixing department, where it is used to treat asphaltum brought from La Patera mine. The refined flux and crude asphaltum are kept at a temperature of about 350 deg. in revolving drums of about five tons capacity each. The amount of flux added depends upon the degree of hardness required in the refined asphaltum. In about five hours the charge is run into a kettle, in which the impurities settle to the bottom and are drawn off by a worm for use as fuel. The refined asphaltum is taken through another steam-jacketed pipe to the barreling tank, from which it is drawn into a traveling kettle running on an overhead gear and discharging its contents into barrels.

Electrical Progress.

The Burning Out of Armature Coils.

Burned armature coils cause probably more delay in the operation of closed-coil arc dynamos than anything else. Wholesale burn-outs, such as are caused by lightning, are not referred to, but those where one or two coils go without any apparent reason. Usually the trouble starts in one coil, but if the machine is not stopped at the first sign of smoke, three or more coils must be rewound. Upon testing out for grounds, etc., everything shows up clear, and the attendant is sometimes at a loss to understand it.

Geo. F. Woolston Jr. was at one time in charge of a number of these dynamos, which were required to be run day and night for long periods, allowing very little time for repairs and adjustments. Every now and then an epidemic of burn-outs would occur. Coils would go so fast that it was hard to keep them repaired. The whole trouble was finally traced to bad lamps on the line. Some of these lamps, when the carbon was almost consumed, would allow the arc to change so rapidly that the regulators on the dynamos could not work fast enough to keep the machine from "slopping over," or, in other words, an arc would form clear around the commutator. This was disastrous. It burned little jagged points in the segments and caused some of them to short-circuit. If the short-circuit held (was not burned off) an armature coil gave out at once. It is needless to say that the lamps were at once overhauled and put in shape. When this was done, there were no more burn-outs.

It often happens that the dynamo regulator runs either too fast or too slow—regulators requiring motion from the dynamo being here referred to. In one case it shifts the brushes too far either way, and in the other it does not shift them quickly enough to compensate for changes in the line resistance. A little experimenting will correct either evil.

In the case cited, the bad performance of some of the lamps was largely due to worn rods. The length of rod worn in a lamp depends upon the average length of carbon consumed per trim; at such times as the lamp is required to burn longer than usual, a part of the unworn rod enters the clutch, and the weight of carbon being less, it does not feed properly.

Direct-current motors are subject to the same trouble of coils burning out. Short-circuited commutator bars or cross connections cause much of this. The cross connections are necessarily crowded into a small space, and the constant rubbing is very likely to cause a short-circuit. Unless pains are taken to examine and repair these strips the coil will burn out again. Another frequent cause of trouble is the breaking of these cross connecting strips. This is especially true with geared motors on account of the jar. The break will immediately show itself by a flashing at the commutator, the exact location being made known by a burnt spot between two segments, or pairs of segments. A break of this kind can be temporarily repaired in some motors without removing the armature. A piece of insulated wire soldered onto the flange of the commutator on the outside, in such a way as to bridge the break, will allow the motor to run until such a time as permanent repairs can be made.

There seems to be considerable difference of opinion as to the use of sand paper on commutators. In Mr. Woolston's opinion it is impossible to lay down any rule for the care of commutators, for the reason that there are so many different kinds. Some are hard, some are soft, and some are both hard and soft. The only way to keep one of the latter kind running at all is by the frequent use of sand paper.

WANTED.

A good pair of Assayer's Balances. State make, price, etc. Address "B," care this paper.

WANTED.

A position as Millman in quartz mill by young man, one who can keep a mill running. Address A. E. CHARLESWORTH, Lockeford, San Joaquin County, California.

WANTED.—A Second-Hand 5 OR 10 STAMP MILL.

Address, stating particulars, price, etc., A. B. this office.

FOR SALE.

GOLD MINE IN SHASTA COUNTY. Price asked, $3500—In the ore, now ready to stope. Fullest investigation desired. Address, principals only, "Gold Mine," this office.

FOR SALE CHEAP.

Gold Wet Washing Machine, MAIT'S MAKE. Capacity, 8 Tons Per Day.

Good order. Can be carried anywhere by prospector.

Address T. L., this office.

FOR SALE CHEAP.

First-Class Air Compressor (Steam driven) and Drill, New.

Also, 3-Ton Capacity Pulverizer.

A. L. FISH, 59-61 FIRST ST., San Francisco.

FOR SALE.

PROMISING QUARTZ MINE In Sierra County, California,

With 10-Stamp Mill, run by Steam or Water Power. Fully equipped with all necessary tools. Free water. A little more development will make the mine a first-class proposition. Address "E," P. O. Box 2504, San Francisco, Cal.

FOR SALE.

23,000 Feet 10 5-8 Inch Steel Pipe,

Lap welded and screw joints. Weight about 27 lbs. per foot. Will stand about 600 lbs. pressure

Three Compound Duplex Worthington Pumping Engines, Several Pumps and Heaters,

And everything pertaining to a plant capable of elevating 3200 gallons water per minute 550 feet. Plant only operated one week. Address

LEE CHAMBERLAIN & CO., Los Angeles, Cal.

FOR SALE.

The Following Machinery, Nearly New. Now Located in State Agricultural Exposition Building at Sacramento:

One 16x42 R. H. Poppet-Valve O'Neil Automatic Cut-Off, 100-Horse Power Horizontal Engine, built by the Union Iron Works, with Band Pulley, 22 in.x124 in. Pipe Connections and Valves complete, as it now stands.

One 22 in. Double Leather Driving Belt.

One 18 in. Union Exhaust Steam Feed Water Heater.

One Buffalo Duplex Boiler Feed Pump 6x4x6.

Two Tubular Steam Boilers, 54 in. diameter, 16 ft. long, in good order, with Furnaces, Grate Bars and Settings complete; one Injector for each Boiler, and all the necessary Checks, Valves and Gauges.

One Stack, 48 in. diameter by 80 ft. long.

For price and particulars, address

EDWIN F. SMITH, Secretary, Sacramento.

MICHIGAN COLLEGE OF MINES.

A State technical school. Practical work. Special facilities for men of age and experience. Elective system. 45 weeks a year. Non-resident tuition $150 a year. For Catalogues, address

Dr. M. E. WADSWORTH, President, Houghton, Mich.

APPARATUS —FOR— Regulating Pressures —IN— PIPE LINES

By the use of this device, the fluctuations of pressure resulting from shock or water ram may be entirely overcome, and where water is used for operating water wheels in connection with hoists or electric-generators, it will be found indispensable, as by its use uniform speeds can be far more easily maintained, and all danger of injury to pipe line will be obviated.

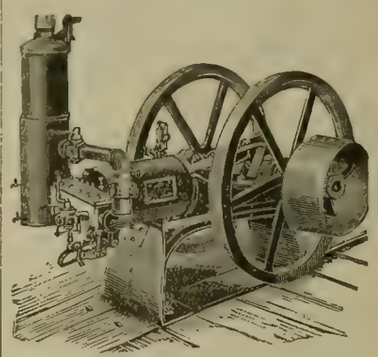
Agents wanted in other cities of the U. S.

British Columbia.

E. S. TOPPING, TRAIL, B. C.,

Has prospects for sale in Trail Creek and the whole of the Columbia basin. Will buy legitimate stock and mines for investors. Will examine mines. Has lots for sale in Trail and Deer Park.

Cheap Power!



SAVE MONEY BY USING —THE— "DANIEL BEST" Crude Oil Engine.

This Engine can be operated on either Crude Oil, Distillate, Gasoline, or Kerosene. **It is the cheapest power on earth** and is not tied to any one kind of Oil, but can use any kind that will make gas and is not handicapped by being compelled to use a certain Oil. Do not forget this when in need of an Engine.

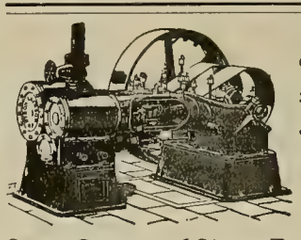
We guarantee our Engines to work perfectly on California Crude Oil, or Distillate, or any other kind of gaseous Oil; we however prefer CALIFORNIA CRUDE OIL, from Coalinga, Fresno county, for the reason that gas from Crude Oil will produce more power from the number of feet of gas used than from any other Oil, and it is also a natural lubricant as well, the valves being always lubricated sufficiently to prevent them from sticking, thus assuring greater durability of the working parts than it otherwise would be in using dry gas. And another advantage we claim is, that danger from explosions is reduced to a minimum, there being no accumulation of gas, but is used by the Engine as fast as it is generated and hence is absolutely safe. The following is a test that we made with one of our Five-Horse Power Crude Oil Engines, running ten hours on the different gas oils:

California Crude Oil, 40 grav.,	7½ galls. at	5c.,	$.37½
Distillate.....	40 " 7½ "	8c.,	.60
Domestic Coal Oil....	40 " 7½ "	12½c.,	.93¾
Gasoline	74 " 8¾ "	15c.	1.31¼
City Gas.....	1000 feet,		2.00

We manufacture all sizes from two-horse power up, and will guarantee that our Engines will run cheaper and are more simple in construction, have fewer parts and hence are more durable than any other Gas Engines on the market. Seeing is believing; don't take our word for it, but come and investigate for yourselves. You can always see one in operation at our works. We will be pleased to see you and will at all times take pleasure in showing them up. Our Engines are specially adapted for running well and mining machinery—in fact, for any kind of power desired. We are the pioneers and first inventors of Crude Oil and Distillate Engines. **We always lead and never follow.** Send for Catalogue and Price List of the only genuine Crude Oil and Distillate Engine made.

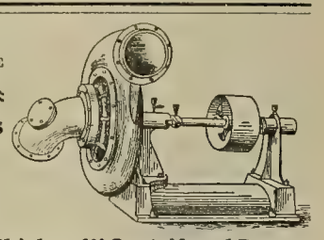
The Best M'f'g Company,

SAN LEANDRO, CAL.



WRITE FOR CATALOGUE NO. 15.

Jackson's GAS —AND— OIL ENGINES.



Cross-Compound Steam Engines and "Whirlpool" Centrifugal Pumps

For Irrigation, Drainage, Dredging, Mining, Etc. Capacities from 50 to 50,000 Gallons Per Minute.

BYRON JACKSON MACHINE WORKS,

625 Sixth Street..... San Francisco.

FRANCIS SMITH & CO.,

—MANUFACTURERS OF—

SHEET IRON & STEEL PIPE

FOR TOWN WATER WORKS.

Hydraulic, Irrigation and Power Plants, Well Pipe, Etc., all sizes.

130 BEALE STREET, SAN FRANCISCO, CAL.

Iron cut, punched and formed, for making pipe on ground where required. All kinds of Tools supplied for making Pipe. Estimates given when required. Are prepared or coating all sizes of Pipes with Asphaltum.

Mining Summary.

CALIFORNIA.

Amador.

At the Amelia mine the shaft is down 80 feet in a slate formation. It is the intention to go down 1000 feet at least before prospecting for the ledge.

Work is expected to be resumed at the Bellwether mine next month.

A new hoist is to be put in at the Anita mine.

Butte.

A diamond drill for the Banner mine was recently freighted down from Greenville. It weighed 4020 pounds.

J. J. Daly bought from C. A. Braselton the quartz mine he was developing near Robinson mill for $10,000.

Calaveras.

Rich gravel is being taken from the Eclipse gravel mine, Tunnel ridge. Superintendent Hall is only doing necessary work preparatory to working the mine on a large scale. The average yield for the six hours' run for the past ten days has been fifteen ounces to each cleanup. The *Chronicle* says when the mine is thoroughly opened and gravel enough can be mined to run the pans their full capacity the yield per twenty-four hours will be about 100 ounces, or in the neighborhood of $1600, and the cost of mining and milling the same will not exceed $125 per day.

C. A. Lillie has bonded the Keystone mine, near Altaville, and will develop the property.

The Lightner Mining Co. have decided to build a 20-stamp mill. The Lightner adjoins the Utica mine on the northwest.

The McElhaney mine at Campo Nuevo, seven miles from San Andreas, owned by F. O. McElhaney, is bonded to the California Exploration Company for two years for $10,000. Development has begun.

The Curtis Consolidated Mining claim between Angels and San Andreas, two miles north of the Utica mine, embraces a tract 3300 feet in length to 900 feet in width and contains a 20-foot vein of quartz and prophyry. The ore in a shaft sunk 40 feet on the vein contains over 20 per cent of sulphurets composed of iron pyrites with strata of finer sulphurets coming in below water level, which the manager thinks will go very high. The main working shaft has reached a depth of 60 feet in quartz and prophyry.

El Dorado.

The Placerville *Nugget* says the Starlight mine is now paying $10,000 dividends per month.

On the Taylor mine lead a 1000-foot hoist is being put on the Esperanza. The Saucerman is putting in a single-reel hoist.

Nugget: There is not as much placer mining as usual at this time of year on the North Side, on account of an unusual scarcity of water.

The Plattsburg mine, near Georgia Slide, owned by the Wilton brothers, is being systematically worked, with good results.

Superintendent Tenbrook of the Gold Bug mine keeps a force of men at work, with promising results.

J. J. Grossman, Supt. Gold Development Co., is working a peculiar mining proposition in the western portion of the county. At present it is neither quartz, gravel or porphyry, but all in one, and a good prospect in each. They have gone down with their shaft 80 feet, at first through clear white quartz, but as depth was reached an old channel was encountered, and from then until now work has been exceedingly slow, not more than 5 or 6 feet per week being accomplished. At almost every step they encounter great basalt boulders which make much blasting necessary. Among the boulders are stringers of gold-bearing quartz, and the greater the depth the richer the quartz and the more sulphurets it contains, the latter being very rich. Mr. Grossman looks for his big pay in gravel when bedrock is reached.

The Two Channel gravel mine, ten miles from Georgetown, H. E. Picket superintendent, has 3000 acres of mining ground, and is operating a 10-stamp mill.

The Zentgraf or Chapman mine 20-stamp mill is in constant operation. The shaft is down 780 feet.

At the Flora mine, Volcanoville, is being operated a giant.

At Horseshoe Bar, a mile from the Two Channel mine, is the Horseshoe Bar mine, running a hydraulic elevator employing sixty men.

Fresno.

W. Wakefield from Pine Ridge reports rich strikes of gold-bearing quartz in that locality. He owns placer diggings on Laurel creek, in the vicinity of Bear creek. He has been compelled to stop work for want of water, but will resume in the fall. He is but a short distance from the strike made by L. Rebordore, on Bear creek, and says that this ledge is remarkably rich. Since the discovery of this ledge a number of extension locations have been filed. People have gone to prospect on Dinkey, Laurel and Bear creeks.

Humboldt.

The Red Cap Mining Company on Red Cap creek has built one and one-half miles of flume to the mine, 6 feet wide 2 feet deep. At the mine they have one No. 5 hydraulic and two No. 3. The gravel varies in depth from 10 to 30 feet. H. M. Binckley of Clear Lake is superintendent.

Kern.

Dean & Brand's cyanide plant at Kane Springs is ready for work.

Randsburg *Miner*: At a depth of 285 feet in shaft No. 1, Little Butte, the pay chute is from 14 to 24 inches in width. Assays show $471.69 per ton in gold, $5 in silver. E. L. Allen, general manager of the Little Butte mine, has bought the Little Butte extension.

Hafford and Bowman have sold to J. B. Black of Salt Lake one of their mines in the Slate range, fifty miles north of Randsburg. Capt. Black will build a mill.

Inyo.

Jas. A. Yerington, R. K. Colcord, J. F. Parr and George T. Mills have bought the Molus mine and its eastern and western extensions, in Piute canyon, eighteen miles northeast of Bishop. Active work to develop the property on an extensive scale will begin at once. The Molus shaft, now down nearly 100 feet, will be sunk as much deeper as the first move and a mill will be erected. Gov. Colcord will personally superintend operations.

Mono.

From the Eva mine, owned by W. A. R. Loose, have been got out 150 tons of ore, which is being packed to the Bodie tunnel mill. At the Dunderberg about forty men are employed.

This week in the action of Vermilyea & Doyle vs. Judd & Palmer, Judge Virden of the Superior Court appointed A. Farrington receiver of the Mammoth mine, Mammoth district. Vermilyea & Doyle are stockholders of the company, which is a Chicago incorporation. Judd is superintendent of the mine; Palmer is a director. The plaintiffs alleged mismanagement, etc., and asked for the appointment of a receiver.

Nevada.

Active operations will soon be under way at the Stanford mine, which was recently acquired by J. H. Neff, Edward Coleman and W. W. Montague. Joseph Thomas will be foreman.

The *Union* says the Sneath & Clay mine has been named the Phœnix. It is expected that operations will soon be commenced under the direction of Superintendent H. K. Shockley, who arrived recently from Cincinnati, O.

Ohmert & Hume, in the Gold Tunnel mine, near Nevada City, last week, struck a ledge of quartz filled with fine gold. The *Transcript* says the ledge matter will pay $600 per ton.

The new owners of the Texas mine intend putting up large machinery and will work the mine.

At Graniteville, the Netherlands Mining Company, operating on South Fork, represented by D. C. Mitchell, have men working the Birchville, Iowa and Commercial. The new 5-stamp mill will be running by Sept. 1st.

The *Herald* hears that the mill at the English Mountain mine, which was destroyed by fire a short time ago, will shortly be rebuilt.

The Live Yankee Mining Company have men at work in their tunnel at Bald mountain.

Placer.

The Pioneer quartz mine, near Iowa Hill, produced $13,241 last month at an expense of $6582.

Grass Valley *Telegraph*: The Omaha Cons. G. Mg. Co., which lately purchased the Homeward Bound property, has been driving their drifts southward to the ground. A new shaft was begun a few months ago and sunk to water level, when it was stopped to await hoisting and pumping machinery, now completed, and work resumed. The shaft will cut the No. 8 south Lone Jack drift, and from there until the 2000-foot level is reached, when it is the present intention to drift back north and work the Lone Jack and the Omaha No. 2 chutes on their trench in depth. Lateral drifts have been run from the Lone Jack beyond where the new shaft will course, thus greatly facilitating the handling of the ores in the large stopes in this vicinity. Upon the reaching of No. 8 level all work will be prosecuted through this shaft. Two ore bins, one at the new works and one at the Lone Jack, have been built, and a tramway 1200 feet long connect them, upon which the ore will be trammed in a ton car, and dropped in the bin at the Lone Jack, from where it will be again trammed 1000 feet to the Omaha mill. The Omaha Consolidated property gives employment to ninety men, besides about forty contributers in Omaha shaft. The 28-stamp mill is constantly running.

Sentinel: The new 10-stamp quartz mill at La Trinidad mine, in Sailor canyon, sixteen miles southeast of Cisco, is in operation.

The Tadpole placer mine, near Secret House, is working six men running a bedrock cut.

J. B. Knapp, secretary of the Blue Canyon Mining and Development Company, is putting in new machinery to run the power drills. The air compressor will have a 10½x14-inch cylinder.

G. T. Miller & Co., who recently bought the Lost Camp gravel mine, 1½ miles above Blue canyon, have eight men at work.

Republican: In Ophir district the Eclipse has eighteen men at work in the east and west drifts on the 300-foot level. The mill is running night and day on quartz going about $7 per ton.

The Boulder has been running on the co-operative plan. Last month the wages amounted to $3.23 per day for each man, the mill having crushed 73 tons of rock.

At the Hathaway are working sixteen miners, mostly in the 600-foot level.

At the Gold Blossom fifty-five men are working. The new shaft is down 100 feet. In the old shaft they are stoping in the 200 and 300-foot levels, and the mill is crushing thirty tons daily.

The Bella Union mine, situated two and one-half miles from New England mills, has begun ten men, H. M. Bayne superintendent. The 5-stamp mill, crusher and concentrator are run by water raised 10 feet by sipbon from the ditch, with 1120 feet of pipe.

E. W. Chapman is preparing to set men at work on the Three Stars mine near Ophir.

Plumas.

"Lucky Antone" a discharged employe of the Thistle Shaft mine, made a $9,000 strike last week. Charles Fish, who has a gravel claim at the junction of Nelson creek and Feather river, took $3,000 from his claim last week. Nelson creek is considered one of the richest streams in Plumas county.

Bulletin: G. Shideler, who has a mining claim at Light's canyon, Plumas county, last week shipped 4200 pounds of ore to Selby's, for which he received $313. Deducting costs the shipment netted him $130 per ton.

Riverside.

H. T. Duff, at the C. and C. group, Perris, has bought the 5-stamp mill and machinery of the Alice mine, which will be removed and set up on the Virginia mine.

The work on the foundations for the new 20-stamp mill has commenced on the property of the English company at the Gavilan, adjoining the Santa Rosa on the north. The ore runs about $300 per ton.

Work on the Cincinnati Belle is progressing. A 5-stamp mill is ordered to supersede the arrastra.

San Bernardino.

At Virginia Dale, Baird's new quartz mill and cyanide plant will soon be in operation. The Index people are working the Montrose. The F. C. B., on the same ledge, shows a 14-inch ledge at 35 feet, which assays $78.54. Sweesy & Arbios are down 100 feet on the Black Lead and are running a drift, getting out rock to mill. Moore & Sexton have a 50-foot shaft down on their property. Lee Bros. have the Desert King, a 2-foot ledge, which assays $35 a ton.

At Mojave two incorporations have recently been organized—the White Peak Mining and Milling Company and the Mojave Mining and Milling Company and also a cyanide works with capacity of fifty tons per day. The Gypsy mine assays well. Colorado men have bought the mine for $25,000 and will develop the property.

San Diego.

F. Holland will take charge of the Elvada mine, Julian, on which operations are to be resumed.

Shasta.

Iler brothers, on the Iron Mountain range, have their tunnel 800 feet in and have a ledge 7 feet wide.

A. F. Batten, three miles from Redding, has built a wing dam enclosing 120 feet square of gravel. He will pump out the water and clean the bedrock.

H. L. Shannon, superintendent of the Mammoth-Garfield mines at Old Diggings, reports to the *Free Press* that everything is now running smoothly at the mine. The new Hallidie wire ropeway which was recently put in is working very satisfactorily. Thirty men are employed and from forty to fifty tons of ore are moved and carried to the railroad by the ropeway each day. The ore is shipped to the smelters of the Mountain Copper Company at Keswick.

E. G. Martinez of French Gulch has a contract to run a tunnel on the old Connor mine and is in 250 feet and taking out free gold ore that will average $45 to the ton. The mine is owned by J. W. Hunt of Sebastopol, Sonoma county, who will shortly erect a mill.

At Harrison Gulch men are at work night and day in six of the tunnels, and a shaft will soon be sunk on one of the ledges. Hoisting works run by steam power will be used as soon as the shaft is well under way. It having finally been decided to use the cyanide process, three tanks and a gasoline engine have been put in. At present it is only by pumping the water back again after it has been used that they are able to keep ten stamps running.

Sierra.

At the Thistle Shaft mine work has been suspended, working the mine through the present shaft being impracticable. The company may have to tunnel. The suspension will be only temporary.

The owners of the Butcher Ranch quartz mine have a ledge assaying $18 a ton.

Recently a quartz ledge was discovered on the Gold Bluff ground 3 feet in width which prospects well in free gold. A tunnel is being run to tap the ledge.

The Willoughby mine, Gold Valley, has been started up. Some rich rock has been found at the upper tunnel.

Siskiyou.

F. Beaudrey has acquired possession of several hundred acres of mineral ground on Wild Cat and is making preparations to mine on an extensive scale. A ditch is being built from Jackson creek, several miles in length, and of capacity sufficient to carry on extensive hydraulic operations.

It is reported to the *Journal* that two prospectors took out $8000 worth of gold from a mine on Canyon creek, near Callahans, in half a day. There is a great deal of good mining ground in the vicinity of Callahans.

Parties returning to Montague from Coffee creek report at least 500 people at the diggings, with more constantly arriving. They also report rich strikes made at the head of the east fork of Salmon river, which heads near the source of Coffee creek, in Siskiyou county—a piece of gold, gravel and quartz combined, as large as a man's head, having been found.

The south fork and east fork of Salmon river, head in the Salmon range in this county, along the border of Trinity county, where Coffee creek and other streams running through Trinity to the Klamath river also head, all contain rich mines. Rich finds have been found at various times between Callahans and the head of the above-named streams, as well as at Jackson lake and the numerous gulches that extend down into Siskiyou and Trinity counties from the Salmon range. Over on Methodist creek, Know Nothing creek and other tributaries of the south and east forks of Salmon, many good paying mines are worked, both quartz and placer. On Know Nothing the Dannenbrink brothers have a fine quartz ledge, and Bennett, at Forks of Salmon, has some very rich mining properties. Over the mountains, from Salmon river, in Trinity county, are the noted New River quartz ledges that created so much excitement a number of years ago and which still yield large returns. The entire country at the headwaters of the Salmon and Trinity rivers in the Salmon, Trinity and Scott mountain ranges, contain rich gold fields, which extend down to and along the Klamath river. The same range of mountains connect with the Humbug range on the west side of Yreka and the mountain ridges of the Klamath, all the way to the Siskiyou mountains on the Oregon border.

Reports from the Happy Camp mining district state that excellent work has been accomplished in the placer mines in that section this season. Among the properties down there which have been paying handsomely is the Siskiyou mine, just opposite the Bunker Hill mine.

The Klamath Flume & Mining Company, in Happy Camp district, have a large tract; a large sum has already been expended in fitting the property up, and by the first of the year they will probably be ready for operation.

Mining on the head of Empire creek is in full blast at present, and all the miners seem to be doing well, making from $2.50 to half an ounce a day. Hungry creek, else in the same section of the Siskiyou foothills, near the Oregon line, is paying well this season.

Tehama.

Kestner & Thompson of Red Bluff have bonded their copper and gold property thirty miles west of Red Bluff, on Elder creek, to M. C. Conway of San Francirco for $75,000. Development to be commenced within thirty days; ore which is refractory shows $19.85 in gold and silver, and 220 pounds of copper to the ton.

Trinity.

Fourteen miles from Junction City, and from Weaverville about twenty-four miles, R. A. Skinner, on the Yellowstone mine, worked on a lease from the Niagara Company, with ten men and a 10-stamp mill, crushes $11 rock.

The Enterprise, one mile below the Yellowstone, operates five stamps. The ore mills from $15 to $20 to the ton from a depth of 400 feet.

Adjoining the Lone Jack, the North Star with ten stamps is at work part of the time.

Writing from Trinity Center a *Searchlight* correspondent says: The activity which naturally follows an important mining discovery is already assuming large proportions in this locality, and the steady stream of prospectors passing through here presents a lively reproduction of former mining days in California. Prospectors are lining the tributary gulches of Coffee creek, and although no strikes of great importance are reported from the immediate vicinity of the famous Graves mine at Morrison gulch, ten miles northwest of here, there have been some good discoveries made above that place. The prospectors are nearly all headed for Hickory gulch, about twenty miles northwest of here and directly beyond Morrison gulch. Trinity Center being the last point of securing supplies, the miners usually complete their equipments here. Last evening the last miner's pan in town was sold, and the dealers were compelled to telegraph for a new supply. The only means of getting freight or supplies to Hickory gulch is by way of pack trains over a narrow and difficult trail from Morrison gulch via the Nash mine.

The one strike which carries the most interest is that of Burgess & Murphey, who had been reported to have taken out $80,000. A prospector named John A. Lytle, who arrived here directly from there Saturday night, said that this report was a base fabrication. The fact is that on the 7th inst. Benjamin Burgess, formerly of Dunsmuir, having followed up a trace which he had last year found in a seam of clay, struck pay dirt in rich quantities, he with his partner, John Murphey, taking out $149 in the first twenty-two pans. They followed up the seam a distance of 400 feet, various tests yielding $5 to $20 per pan. Knowing that they had a good thing and fearing that they were losing considerable value, they decided to cease washing with a pan and construct a rocker. It is said that they are taking out about $200 a day and have already $800.

Large crowds of prospectors are reported in that locality, many coming from Dunsmuir and other points in Siskiyou county. Several small strikes, both placer and quartz, are reported.

In the '60s a man named Morrison took out $11,000 in one month from the bed of the gulch which bears his name. The pay channel was lost and a company organized for the purpose of recovering it removed great banks of gravel and was ruined financially in its vain effort to locate the treasure. The channel ceased to pay at the mouth of Graves gulch, and the present trio of lucky miners reasoned that the value must have issued from the smaller gulch. On this theory they worked the gravel of the creek and took out $4800 last April. Following a trace which led them out of the creek bed, they finally discovered the seam, on which they commenced opening a cut only two weeks ago to-day. They at once began finding small pockets containing pure gold and manganese, and found sixteen of these pockets, yielding in all some $4000 before striking the large deposit of gold—about $88,000, all in one cavity.

About $600 or $800 was taken from a seam near by, which bears toward the other at an angle that promises to converge them at a distance of thirty or forty yards from the surface and and a depth of 50 or 60 feet, where a large chimney of valuable formation will probably be found. It is the opinion of an experienced mineralogist who personally visited the mine that the property will yet yield many pockets of good value, but that it will be disclosed with little more development that the seams are not fissure veins, but gashes or surface checks. This is indicated by there being no sign of slipping or friction on the walls. There is no way of ascertaining the depth they penetrate, but that they will eventually pinch out and leave no seams is the history of all similar formations. The large deposit of gold is explained by the gash

forming a cavity which acted as a reservoir for the drain of all soluble minerals coming from a wide iron dike located some 400 feet up the mountain side, and to which the seam forms a right angle. This dike is traced for many rods and is believed to be impregnated with gold and other precious metals. The gold discovered was found in a formation of ochre, manganese and talc, and was enclosed in altered dioritic porphyry. It is located in a matrix of hydrated iron and clays, which came out of the big iron ledge and are simply the filtration of minerals in solution, forming slowly in the lapse of ages.

At the Oro Fino, seven miles north of Trinity Center, owned by Strode brothers, the lower or fifth level, running on the ledge, is now in over 600 feet and has a depth of 900 feet. Nine men are employed and a 5-stamp mill is operated. Mr. Strode expects to put in a larger mill next year.

A good strike is reported in the Carr mine, adjoining. Here the ledge pinched into a seam too narrow to render treatment profitable. Some $5000 or $6000 had been removed by an arrastra. A tunnel of 150 feet was run on the ledge, a winze of 50 feet sunk, and the ledge has slowly broadened out into substantial proportions, and can now be operated with profit.

Located four miles above the mouth of Morrison gulch, and on the opposite side of Coffee creek, are eight claims owned by P. A. Wagner of San Francisco. Five men are at work. A series of cuts into the lead indicate the course and size of the ledge 1700 feet up the mountain side. The ore contains about 6 per cent sulphurets. A 20-stamp mill will be put in as soon as a road to the mines can be built. Mr. Wagner says he will employ 100 men.

Tuolumne.

The Sonora *Democrat* reports that the ledge in the tunnel's face of the Woods Creek mine at Yankee Hill measures 4 feet. It was purchased some time ago by a French company from G. Mapes.

At the Confidence the 800-foot shaft, with its 6 feet of good vein in the bottom, will shortly again be driven down. The sweeping plant for collecting slimes is nearing completion.

The Golden Gate mine closed down Tuesday, the water supply being cut off. The reason was the breaking of the Tuolumne Co. Water Company's flume at Middle Camp, and, as a consequence, many other properties on the east belt and mother lode will be forced to temporarily hang up.

Last Saturday an $800 nugget was found in the Louis Dondero placer claim near Yankee Hill. This chispa, together with the $1930 piece of two weeks ago, makes one believe that there is plenty of coarse gold in the county yet. The claim is clearing, aside from exceptional nuggets, over $1000 per month.

Yuba.

The Good Title mine, at Indiana Ranch, is producing about $3000 per month with a 5-stamp mill.

NEVADA.

Ten carloads of silica from near Virginia City are being shipped to New York. It is sold there as electro silica in small packages and is said to be the best of polishing powder.

The Knickerbocker mill and mines at Ione have been sold to the Austin Mining Company for $23,000.

At Stateline the Ophir Company recently uncovered an 18-inch chute which sampled 1000 ounces in silver and $18 in gold.

The Creole Company is shipping ore thirty miles to Ploche to be milled in the Yuba mill by Anthony Godbe.

The sheriff of Humboldt county has sold the Hidden Treasure and Emma mines at Kennedy to the First National Bank of Winnemucca for $1709.

The Tuscarora *Times-Review* says: A lot of high-grade ore and concentrates from the Nevada Queen, in the neighborhood of $10,000, have been sent to the Selby smelting works. Six men are now at work taking out considerable high-grade ore in addition to that which goes to the mill for concentration.

J. E. Peck next month begins working the old Raymond & Ely tailings at Bullionville by his new process.

Enterprise: H. H. Blood, superintendent of the operations of the firm of Harris, Blood & Co., who are to reduce the Park tailings by the electro-peroxygen process, is commencing operations in Six-mile canyon.

OREGON.

Borden & Howell of Evans creek, Josephine Co., are building a twelve-mile ditch to cover their placer mines and expect to employ a large force of men shortly.

The 64¾ ounces of bullion from the Oregon Bonanza mine in Williams district, which was shipped to the Selby smelting works at San Francisco, yielded $1008, or a little over $100 to the ton of ore crushed.

The Eureka Mining Co., the new owners of the Denver City ledge, on Soldier creek, Josephine county, will employ thirty men soon.

The Jackson Mountain Mining Co. has incorporated to mine gold, silver and copper in Jackson county; capital, $750,000; office, Portland; D. M. Watson, C. L. Carr and A. J. Farmer. The company is developing a quartz mine near Jacksonville.

The Geiser brothers of Baker City, who recently sold the Bonanza, have bought the Diadem and Brindle Horse, six miles west of the Bonanza, for $15,000.

WASHINGTON.

Dennis Ryan, of St. Paul, has bought the Deer Creek mines near Silverton for $150,000. According to the estimate made by his mining engineer, Martin Currin, $200,000 must be expended in order to carry out the contract entered into with several of the larger holders. The first thing to be done will be to put in a 20-drill air compressor, on which work will begin early in September.

The French Creek Mining Company, operating in the Big Bend, is capitalized for $2,000,000. It is operating two and a half miles of gravel ground on French creek. The company have a complete plant, costing $80,000, in transit. They will be ready to wash next season. They have sixty men employed on flume work, of which they are putting in about 2000 feet, and they soon expect to have their pipe in place. The head of water will be 400 feet. G. J. Atkins is manager.

BRITISH COLUMBIA.

J. B. McArthur, being asked by the *Miner* what effect the decline in silver was having on Slocan ores, said: "If silver does not go below 50 cents silver mining in the Slocan will be as profitable as last year, and will be profitable in most of the mines at 40 cents. Lead is now $3.60, with a duty of $1.50, leaving the net price to the British Columbia mine owner $2.10 per 100 pounds. Lead last year was from $2.10 to $2.30, with a duty of 75 cents, leaving the net only $1.55. The mine owner thus nets 55 cents per 100 pounds more on his lead than last year. S. McDonald of the Payne mine states that they will ship until silver strikes 25 cents, and then make money."

At Pilot Bay twenty men are fixing up the smelter, to be running in October.

A Nelson report says: As a result of Prof. Carlyle's tramp around the different sections or West Kootenay, an amendment to the mineral act may be expected during the next session of the legislature. Throughout the entire district, but more especialy in outlying districts, he has observed a tendency on the part of claim owners to cheat the provisions of of the mineral act dealing with the performance of assessment work upon claims. Though the present act is most liberal, in that it admits of the recording of locations before performing any development work whatever, there is a disposition on the part of claim owners to shirk the annual assessment falling due within the year following the location of claims by a system of re-location. The effect of this is that large areas are staked off and no work is performed beyond the driving of the stakes. In one district—Trout Lake—Mr. Carlyle came across one individual who was holding sixty claims. These men are unable to do necessary development work themselves, and by evading the spirit of the act they stand in the way of those who are willing and able to do the necessary development. This system naturally tends to retard all new districts. To overcome the difficulty Prof. Carlyle is of the opinion that the mineral act should be amended so that before a location can be filed in the record office the locator of a claim should be required to perform $100 worth of work. As the opinion of Mr. Carlyle will no doubt have considerable weight with the minister of mines, some such amendment may be made to the mineral act next session, unless Prof. Carlyle can be induced to change his mind in this respect before the legislature meets again.

ALASKA.

A contract for the machinery and equipment of a 100-stamp mill has been awarded by the Alaska United Gold Mining Company for operations upon the site of the new bullion producer. The *Mining Record* learns that the Treadwell Company is about to add 300 stamps to its milling capacity. A new mill of that size is to be built upon the Treadwell property, near the site of the present 240-stamp mill, which, while entirely independent in its operations, will, before the close of 1898, steadily drop its stamps on Treadwell ore. The new five-compartment shaft, while far from the depth to which the intention is to sink, has uncovered new reserves of ore which make it positive that a doubling of the present plant is entirely warranted, and, as soon as the opening of spring will permit the beginning of building operations, the Treadwell Company will break ground for a stamp mill which will not find an equal on earth, not only as to size, but in every point of arrangement and equipment.

In a report made some time since Captain Mein said that, while the pay ore did not become richer in depth, the deposit is much larger than there was reason to believe from the developments made up to that time. In the east end there is a block of ground embracing two sections, which were considered waste, but which have been proved by new development on the 220-foot level to be the best ore in the mine, and there are 400,000 tons of good milling ore in the block. Supt. Duncan has estimated that there are 2,960,014 tons in sight, but he is said not to have allowed for the ore above the adit level and only for ore exposed to the end of the drifts being run. For these reasons Captain Mein says there are 5,000,000 tons above the 220-foot level, and it is safe to estimate it will last 100 feet below that level, which would make 7,000,000 tons. He recommended the erection of another 240-stamp mill and this was endorsed by the company. It appears, however, that a South African mill of 280 stamps is in course of construction, and that the famous Treadwell might not be deprived of the honor of being the largest stamp mill in full operation in the world the company decided that the new mill shall be one of 300 stamps. When these are in operation it is thought that the cost of mining and milling the Treadwell ores will not exceed $1 a ton.

A letter from James O'Brien from Klondike says "a new strike has been made on a creek sixty miles above Klondike, near Stewart river." Forty-seven pounds of gold had been taken out of the discovery hole. As is the case in a mining country, no matter how widely distributed, the news rapidly spreads, and those who had failed to strike it rich at Klondike were rushing for the new diggings. As the letter was being written 150 men were starting from Klondike for the Stewart river, just as hopeful as when they took part in the rush to Eldorado and Bonanza creeks. O'Brien says all the six tributaries of the Klondike river are proving rich beyond report. Adams creek is the only one condemned by the writer.

UTAH.

At Park City Supt. Chambers of the Ontario says all necessary work such as timbering work drifts, taking out some rail and cleaning up in general preparatory to the closing of the mine was being pushed rapidly, and as soon as the work is completed the mine will be closed indefinitely and would not be reopened with silver at 52 or even at 60 cents per ounce, as the mine could not be worked at a profit with their production at such a figure.

The mill on the Last Chance mine, recently destroyed by fire, is to be rebuilt and in operation in the next ninety days. M. R. Hunt is the manager.

The Yellow Jacket Copper M. Co. has incorporated at Salt Lake; capital stock, $50,000; W. C. Higgins secretary, A. L. Morris general manager; to work the Yellow Jacket lode in the San Francisco mining district, Beaver county.

Salt Lake *Tribune*, 24th: Unless the ills that are now sapping the life out of the diggings are quickly overcome it is not unlikely that a number of the most prominent mines that have been wasting away will close down early in the coming month. That the Bullion-Beck will resort to the step was admitted by one of the directors yesterday afternoon. The inconsistency of a struggle against present hardships, he said, had been laid before all, from the man who is advocating a single gold standard to the corporation which has advanced the cost of wheeling the ore out of the camps. Attention was called to the low price of silver, which ruled yesterday at 52 cents an ounce; to the cost of explosives; to the advance in the cost of transportation from points where silver is predominant; to the raise in the cost of treatment where the ore does not carry its own fluxes; to the advance in the price of provisions and to other damaging et ceteras, that have been heaped upon the producer. These ills have been laid before those who hold, it is contended, the remedy in their hands, but each has taken the matter under advisement and the average man has lost all confidence in the hope which has been held out to them that relief would come to all who waited.

Of the Bullion-Beck, it is said that it has large bodies of ore blocked out, and that the ore is of such grade as to render it impossible for it to face all these advances and yield a profit to the owners.

There are a score of properties experiencing the same ills, and it is believed unless a remedy is prescribed that there will be a wholesale letting out of men a week from to-day.

The situation is a serious one and the hope is expressed that some understanding may be arrived at by which all interests may be protected, while all the mines are permitted to run. It has been suggested that a conference take place between all those whose welfare is concerned the present week, and that efforts be made to prevent any such thing as a general closing down of those mines that have not lead with which to offset the depression in the silver market. It is said the railroads have the matter under consideration and promise an early reply.

IDAHO.

J. M. Howe of the American Placer Mining Company at Oro Fino reports that owing to the low stage of water the main flume has been abandoned for the time, and ten men are at work with the sluice boxes.

W. T. Andrews, manager Seven Devils Copper Co., Washington county, says the ore bodies show average value 20 per cent in copper, with silver and gold in sufficient quantity to pay expense smelting. A smelter of seventy-five tons per day will be blown September 1st, to be followed by another plant, capacity 350 tons per day. The economical and profitable operation of the property involves the construction of a line of railway, built from Huntington, sixty miles to the Snake river on the east. The new smelter, which is to be a pyritic plant, is to be in operation not later than February 1st, '98.

A. M. Butler has put in a dredge on Snake river, near Nyssa, for Baker & Scott of Tacoma. It is one of the largest ever put on Snake river and has two 14-inch centrifugal pumps; the barge is 50x110 feet; the plant will handle 250 yards of dirt an hour.

The Idaho Democrat group of mines is sold to Boston men for $20,000. It has a chute 130 feet long and 4 to 8 inches thick, of ore carrying an average of 110 ounces silver and 65 per cent lead per ton. This is on two tunnel levels 70 feet apart. It is five miles west of Hailey.

The Granite Mountain Gold & Copper M. Co., at New Denver, controls the claims on Granite mountain and the water right on Deep creek, with ditches, furnishing the water power for development work. The ore is called gold-copper, running, mill test, from 20 to 40 per cent copper and about $8 in gold to the ton, with traces of silver.

MONTANA.

The working of placer ground with dredging machines having proved a success in Madison county, Montana, arrangements are under way to operate with them at Montana City, in Jefferson county.

An Alaska mining company has been organized at Helena. It cost $1003 to file the articles. The capital is $25,000,000; incorporators are P. B. Weare, J. Cudahy, C. A. Weare, W. W. Weare, Chicago, and T. C. Power, Helena. It is proposed to engage in all sorts of mining enterprises in Alaska and Montana, do a trading business, build cities and towns, and put in telegraph and telephone service.

The drop in the market value of silver is a matter of consequence to the Anaconda mines, which produced 5,433,826 ounces of silver last year. As it depends on silver and gold to furnish the bulk of its profits the decline in in silver is a serious matter. With the decline in silver from 68½c., which it received last year, to the present price received, in order to pay 10% on $30,000,000 capital, it is figured that Anaconda will have to produce 1,250,000 more ounces of silver than it did last year. Every cent that silver declines in price per ounce means a loss of $54,338 on the basis of last year's output.

At Livingston Work, Larimer & Ewing will operate the McCauley mine and mill, Crevasse district. The mill now on the property will be improved by a concentrator.

WYOMING.

Salt Lake *Tribune*: At Basin City two prospectors are washing out gold from the sands of the Big Horn river by the carpet process. The sand is shoveled into a large box into which water is pumped with an old-fashioned hand pump. The dirt then runs over a set of riffles and goes into another box in which an old piece of carpet is stretched. The wash passes over this carpet, which arrests the particles of fine gold. The carpet is then shaken and washed, quicksilver added, and the resulting mass is washed. This takes out the quicksilver and leaves the gold dust. The dust is extremely fine and could not be saved with the ordinary apparatus.

COLORADO.

A. S. Dwight, general superintendent Consolidated Kansas City Smelting and Refining Company, says the smelting interests at Leadville are improving. The Arkansas Valley smelter is handling 900 tons of ore a day, which is more than any other smelters, with very few exceptions, are now doing.

The Pactolus Hydraulic Mining & Milling Company, near Central City, has works designed to work 2000 yards of gravel per day, and has built a ditch six miles long to deliver 5000 miners' inches 2¼ miles below. As the fall in the river is only about 50 feet to the mile, it has been necessary to employ gravel elevators to raise the gravel and water from the giants to the tail sluice. The works at present consist of the above-mentioned ditch, a storage reservoir of seventeen acres, two lines of 18-inch steel pipe, one of which supplies two giants with water, while the other connects with the gravel elevator, which raises the gravel 42 feet. The elevator and giants are worked under a head of 250 feet water pressure. From the elevator the gravel and water pass through a tail sluice or riffle box 700 feet in length, floored with angle-iron riffles. The advantages these riffles offer, as compared with the wooden blocks heretofore in use in that country, are, better saving of gold, greater facility for cleaning up and durability.

At Telluride the *Journal* reports the sale to the U. S. & B. C. M. Co. of Kansas City, Mo., of the Liberty Bell group of properties, in Cornet creek basin, for $50,000. Ten per cent of the amount was deposited in the Bank of Telluride. The company will work the mine on an extensive scale.

Says the Rico *News-Sun*: The Enterprise mine continues to employ nearly 100 men and is adding to the force; sixty men work on ore, the remainder development work. Five drifts are being driven under contract, by the month; the contractors average better than day's pay at the going wages of the camp. Ore enough is blocked out to keep 200 men busy for months. This ore carries about seventy ounces silver and nearly an ounce in gold per ton. Development work is now confined to those veins showing a predominance of gold values. Every ton of ore shipped from the mine runs from $20 to $200 per ton, showing why Rico's great property continues to work while others are closing down.

NEW MEXICO.

Next month it is expected that the new mill at Cerrillos, to reduce ore by the Stewart process, will be in operation. Estimated capacity fifty tons of ore per day. The process is to subject the ore to a combination of furnace heat under blast and suction draft and steam, which forms a superheated steam, which is drawn down through the ore and will take the zinc and lead out into a water tank, separating the gold and silver from the rock and depositing them upon the bottom of the tank, being thence gathered off by quicksilver.

The Challenge mine at Hematite is now being worked by the Challenge Mining & Milling Company. It has widened from a 14-inch pay streak to 2 feet. The company is pushing the construction of its fifty-ton chlorination mill being built one mile below Hematite.

ARIZONA.

At Pearce the Commonwealth Company propose to increase the capacity of their mill from 60 to 120 tons per day.

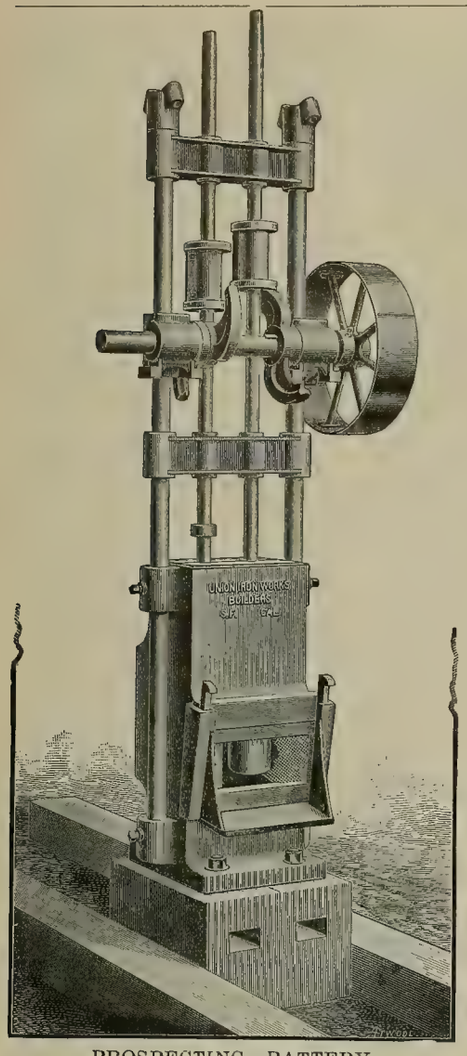
The 120-ton concentrator on the Elkhart mine, Chloride, made a satisfactory trial run last week. This plant is the largest of the kind in Arizona. The successful operation of these works means much for Mohave county. With the plant in full operation the output of concentrates should reach twenty-five tons per day.

A suit has been filed against the Detroit Copper Company of Morenci by the same parties who are sueing the Arizona Copper Company of Clifton. Both complaints are that these companies are using a process in converting copper matte into block copper, part of which is an infringement on a patent claimed by a Frenchman, who is represented by a Washington City attorney.

At Crittenden, the Columbia Smelting Company have erected a complete silver-lead reduction plant. The furnace is 100 tons capacity. The ore is from the Flux and Hardshell mines. The coke and iron ore come from New Mexico. The limestone is blasted a few miles north of the plant. The expenses of the company are estimated at $600 per day. About seventy-five or eighty men are employed, fifteen at the mines.

MEXICO.

D. B. Nichols wires from Guadalajara that he has just sold a mine there for $2,000,000 to an English syndicate. Nichols has been the superintendent for years; his share is stated to be 25% of the purchase price.



PROSPECTING BATTERY.

UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

THIS : :

Two-Stamp Self-Contained Battery

IS DESIGNED BY

THE UNION IRON WORKS

Expressly for Prospecting Work.

It was awarded First Prize at the recent Mechanics' and Manufacturers' Fair, where it was in daily operation, crushing ores from various mines throughout the State.

Weight of stamps, 275 pounds each; capacity of battery, determined by actual work, 200 pounds per hour, through a No. 7 slot-punched screen.

Entire battery weighs about 3000 pounds; heaviest piece, mortar, weighing 1200 pounds.

Can be taken apart and transported to any locality.

W. H. BIRCH & CO.,

Office and Works, 127-129-131-133-135 First Street, San Francisco Cal.

WRITE FOR A CIRCULAR ON THE

"BIRCH" IMPROVED TWO-STAMP MILL.

IRON FRAME, TRIPLE DISCHARGE, 850-LB. STAMPS, FORGED STEEL SHOES AND DIES.

Price, $450 f. o. b.

Manufacturers of the LIGHTNER QUARTZ MILL.

CYANIDE Highest Known Grade OF CYANOGEN. POTASSIUM.

GUARANTEED 99% and over.

In 112-lb. Zinc Lined Cases.

—MADE BY—
THE GAS LIGHT & COKE COMPANY.
Works at BECKTON near LONDON, ENGLAND.

For Prices, Address
SCHOELLKOPF, HARTFORD & MACLAGAN, Ltd., Sole American Agents.

No. 3 Cedar Street, NEWYORK CITY.

For Placer Mining.

THE EDISON GOLD SAVING MACHINE.

The Most Complete Machine in the World for GRAVEL WASHING.

Guaranteed to Save Every Particle of Flour and Flake Gold, and Floured Quicksilver.

WILL HANDLE 3 TONS OF GRAVEL PER HOUR.

Minimum power and water required. Requires but one handling of gravel. By motion of machine water is returned and used over and over again. Light, durable and easily transported. Simple in construction and inexpensive.

The EDISON MACHINE COMPANY,
ALBUQUERQUE, NEW MEXICO.

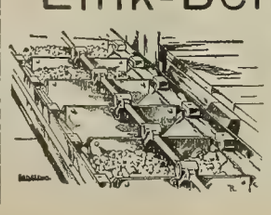
HORACE F. BROWN, CONSULTING ENGINEER.

Special attention given to preparing plans for the Chlorination and Bromine Processes of Treating Gold Ores.

PATENTEE { Brown's Complete Automatic Mill Process. Brown's System of Mechanically Stirred Roasting, Cooling and Conveying Furnaces, Etc.

1607-8 Manhattan Building, Chicago, Illinois.

Link-Belt Machinery Co.,



ENGINEERS, FOUNDERS, MACHINISTS,
CHICAGO, U. S. A.

MODERN METHODS as applied to the handling of Freight, Grain, Ores, Raw and Manufactured Products.

MALLEABLE IRON BUCKETS, Approved Pattern and Weight; ROPE POWER TRANSMISSIONS, SHAFTING, PULLEYS, GEARING, CLUTCHES, ETC.; ELECTRIC COAL MINING MACHINERY.

SEND FOR CATALOGUE NO. 20.

"The Mining Laws of the State of California."

By FREDERIC HALL, Author of Hall's Mexican Law.

With opinions of the Attorney-General and J. F. Cowdrey, Esq., on the New State Location Law, and Court Decisions on important points.

Price, 30 cents, by Mail, Postal or Express Order.
Address J. BELL, Publisher,
Box 424,.....Los Angeles, Cal.

QUICKSILVER!

—FOR SALE BY—
The Eureka Company,
OF SAN FRANCISCO.
ROOM 1, - 426 CALIFORNIA STREET,
SAN FRANCISCO.

Coast Industrial Notes.

—Dollar wheat at last.

—California's '97 wheat crop will be 30,000,000 bushels.

—Everything except wages is appreciating in value in Mexico.

—A railroad from Juneau, Alaska, to Dawson City is discussed.

—Jamestown, Cal., expects to be the terminus of the Sierra Pacific Railway.

—The Starr mills at Crockett, Contra Costa Co., Cal., are to be used as a beet sugar factory.

—The dredger has finished work on the Grand Island, Cal., levees after a run of three and a half years.

—At the 30th annual fair of the Mechanics' Institute in this city thousands of visitors are now daily delighted.

—Stockton, Cal., is shipping flour to Peru. It also sends a shipment of flour in barrels that is destined for Shanghai, China. It is unusual to ship flour from California in wood.

—The McCloud River railroad from Upton, near Sisson, Cal., for twenty miles around the base of Mt. Shasta to Squaw valley, is completed and in operation. The eastern terminus has been named McCloud instead of Vandale.

—The Mt. Diablo coal mines are attracting attention. The Pittsburg Mining Company, developing mines at Somersville, six miles north of Mt. Diablo, has bunkers at Los Medanos. The Black Diamond mines were at one time large producers of coal.

—The Los Angeles and Pasadena Railroad Company has incorporated: A. McNally, D. B. Dewey, Chicago; J. H. Hughes, Pasadena, Cal.; M. H. Sherman, Phœnix. It is proposed to build a road from Los Angeles to Pasadena, at an estimated cost of $1,000,000.

—The biggest raft of piles ever towed down the coast arrived at Oakland, Cal., harbor recently from the Columbia river. It contains 77,060 piles, each about 100 feet in length. It took twenty-four tons of chains to keep them in place. The raft arrived in good shape.

—The San Diego, Cal., Flume Company has 100 men on the Pine Valley reservoir site, eighty miles east of San Diego city, to add 2000 miners' inches to their water supply by a dam 80 feet high and a conduit sixteen miles long. It is expected that the diversion will be completed by February 1st, '98, at a cost of about $100,000.

—A permanent exposition of mining machinery, electrical appliances, agricultural implements, and all kinds of labor-saving apparatus, is to be established by the Peruvian Government at Lima, Peru. Exhibits will be exempt from Custom House duties, and the usual consular fees, and exhibitors will have the option of showing their wares for six months or longer.

—At Solomonville, Arizona, on the 24th, the Arizona Pacific Railroad Company incorporated; capital stock, $10,000,000; incorporators—E. J. Beard, I. E. Solomon, F. Dysart, W. H. Wood, J. Blake. The company proposes to construct a railroad from a point on the Santa Fe in New Mexico to Phœnix, Ariz., passing through the counties of Graham, Pinal and Maricopa, with branch lines to Clifton and Globe.

—An American now doing business in China writes the *Manufacturer* that the Chinese buyer has no idea of a prospective drawing, and illustrations are quite unintelligible even to many of the cultured c ass. He wants to "look see" everything he purchases. He must have actual samples before he can grasp the idea. Therefore it is suggested that there should be established in China a permanent exhibition of American manufactures, with engine power to keep all machinery in motion at all times.

—A proposed California exhibit at the Omaha exposition contemplates a miniature Niagara Falls with wine substituted for water. Over the cataract will continually flow 100,000 gallons of California claret. The rocks and the bed below are to consist of glass blocks, which by means of electric light devices will bring out the ruby color of the wine, and the banks on each side will be decorated with citrus trees bearing lemons, oranges, etc., in growth overhanging grottoes in which visitors may rest and sample the wines and the fruits of California.

Commercial Paragraphs.

"MINE DEVELOPMENT THE BASIS OF PROSPERITY," a pamphlet published by Almarin B. Paul, M. E., 49 Crocker Building, this city, will be sent by him, free, to any subscriber of the PRESS on receipt of address.

H. C. TABRETT, of the Risdon Iron Works, has invented a salt-water evaporator to supply marine boilers with distilled water. The invention has been embodied in a boiler recently placed in the Hawaiian steamer Upolu, which will have a trial trip to the Farallones to-morrow.

THE Central Light and Power Co., recently incorporated in this city, proposes to compete with other companies for the business of furnishing electric light and power. Their plant and business office are in the Parrott Building, San Francisco. A. Brooke-Ridley is consulting engineer, S. L. Naphtaly general manager.

THE Colorado Iron Works Co. of Denver, Colo., closed a contract on the 16th inst. for a 10-stamp mill, erected, to go in near Baker City, Oregon; carload mining machinery to Plomo M. Co., Fort Garland, Colo.; carload hoisting machinery to Ameca, Mexico; large steel caisson to Penn'a S. Co., Sandy, Utah; carload water jackets for El Paso S. Works, El Paso, Texas; carload stamp milling machinery to Oaxaca, Mexico.

Personal.

EMIL SULTZ, SR., is putting up a 20-stamp mill at Sierra City, Cal.

GEO. F. BECKER of the U. S. Geological Survey is at Sutter Creek, Cal.

JNO. DAGGETT is examining his mining property in Siskiyou Co., Cal.

H. F. FULLEN is at Robinson, Nevada, to take charge of the Chainman mill.

H. J. RODMAN is the Phœnix, Arizona, agent of the St. Louis Gold Mining Co.

SUPT. MCCALL succeeds T. B. Dillon at the Monte Cristo mine, Volcano, Amador Co., Cal.

LIEUT. HERBERT DEAKYNE of the U. S. Debris Commission has returned from Butte Co.

ROBT. HEDLEY succeeds Paul Johnson as superintendent Hall Mines smelter, Nelson, B. C.

JOHN MUIR has gone on a botanizing expedition to the mouth of the Stickeen river, Alaska.

SAMUEL NEWHOUSE, managing director of the United States Exploration Co., is visiting Bingham, Utah.

PICACHO, CAL., people are interested in the fact that Col. D. K. Allen is enjoying himself in New York City.

PERCY H. MCMAHON has been appointed superintendent of the Wedge mine, Randsburg, Kern Co., Cal.

GEO. R. TUTTLE of San Francisco has been appointed superintendent of the Rockland mine, Grass Valley, Cal.

L. R. THOMAS will be Register and G. B. Rogers, of Blackfoot, Receiver of the U. S. Land Office at Blackfoot, Idaho.

ON the 17th ult., Chas. Butters was inaugurated president of the Chemical and Metallurgical Society of South Africa.

COL. E. G. HEFFRON, late manager Niagara mine, Bingham, Utah, has come to California to develop a gold property in Shasta Co.

TAYLOR D. MACLEOD of Yuma, Arizona, has sold his group of gold mines to Colorado people and will superintend the development of the property.

C. L. BRANDT of Cripple Creek, Colo., will have charge of the cyanide operations at the North Mountain Company's works, Egan canyon, Nevada.

M. J. HELLER has returned from a trip through Shasta county and has gone to Mariposa county to examine property for an English syndicate.

EX-GOV. MARKHAM has returned from a mining trip to old Mexico, and says that he found a better disposition to sell at reasonable prices than usually exists in California.

JAMES WILSON, Secretary of Agriculture, and C. F. Saylor, the department's special agent on the investigation of the sugar-beet industry, are en route to San Francisco.

D. A. MACDONALD, a MINING AND SCIENTIFIC correspondent, goes to the Klondike today on an $8000 contract to exploit mining ground for a party who have "staked" him.

OSCAR JONES, Forest City, Cal., formerly superintendent Mayflower mine near Forest Hill, now has charge of the North Fork, Bald Mountain Consolidated and Lucky Dog gravel mines and the Minnesota Development Company quartz mine, Sierra Co.

A. O. NEWTON is the new manager for the Butte and Yellowstone Coal and Coke Company, capitalized for $50,000, H. L. Frank of Butte as president. The company will erect twenty-one ovens, and by December it is expected coke will be burning and shipments made to Butte, Montana.

W. M. BAINBRIDGE has resigned the position of superintendent of the Elkton mine, Cripple Creek district, Colo., and expects to locate in Salt Lake City, Utah, September 1st. He will be succeeded at the Elkton by W. B. Wilson, recently identified with mining in the San Juan country.

WM. WESTON, mining engineer of Cripple Creek, leaves next week with the Baron G. de Bellescize to make an examination of gold properties in Poughkeepsie gulch, in the San Juan region, Colorado. On his return he will proceed to Victoria, B. C., on mining business and will probably be in London by the 1st of November.

Recent California Mining Incorporations.

Rappahannock G. M. Co., Oakland, Cal.; R. V. Whiting, S. C. Williams, A. F. Merriman, A. M. Benham; capital stock, $150,000; $6000 subscribed.

Cal. and N. W. T. and M. Co., San Francisco, Cal.; E. F. Gutschow, G. Gross, J. Bergez, H. Lacy and C. H. Newhaus; capital stock, $100,000; $500 subscribed.

Alaska M. and T. Co., San Francisco, Cal.; A. C. Stowe, R. L. Bernair, R. B. Crickton; capital stock, $1,000,000; $50 subscribed.

Greenhorn M. Co., San Francisco, Cal.; M. F. Reilly, D. McNee, M. Goldberg, M. W. McIntosh; capital stock, $300,000; all subscribed.

Alaska M. and T. Co., Alameda, Cal.; A. J. Samuel, C. E. Severance, T. B. Hussey, W. H. Cameron, J. M. Bartlett; capital stock, $100,000; $15,000 subscribed.

Association for Alaskan Exploration and Mining, San Francisco, Cal.; C. M. Oakley, D. G. Dexter, J. H. Ginder, M. S. Woodhams; capital stock, $250,000; $175 subscribed.

The Chloride Point, Utah.

It is believed that there is at present no exclusively silver mine in operation in the United States. There are several in which silver is a by-product.—*Mining and Scientific Press.*

We can cite the PRESS to at least one exception—the Chloride Point, which carries no lead or copper. It is true that small gold values are obtained, but the mine would be operated as usual were there none, as the ores run very high in silver and the vein is large and uniform.—Mercur, Utah, *Miner*, Aug. 20th.

Recently Declared Mining Dividends.

Mercur, Utah, $25,000, Aug. 19; total to date, $775,000.

Geyser-Marion, Utah, $9000, Aug. 21.

Mercur, Utah, $25,000, Aug. 20.

New York, Honduras and Rosario M. Co., 10c per share, $150,000, Aug. 25.

Homestake mine, South Dakota, 25c per share, $31,250, Aug. 25.

HO! FOR ALASKA'S GOLD FIELDS!

Greatest gold fields on earth. We have just published a complete guide to Alaska fully describing all her rich gold fields, telling how to get there, cost of trip, routes, etc., also mining laws. Fully illustrated; only reliable book. Facts and views secured by special correspondents right on the ground. Post yourself by securing "inside" information ahead of the crowd. For the present we will send a book free to anyone sending us 25c postage for a 3 month's trial to our big illustrated weekly family paper. Clubs of 5 and 5 books, $1. Agents send 25c for sample. Mention THE PRESS. *Weekly Sentinel*, Denver, Colo.

Notice for Bids.

Sealed proposals will be received by the TUOLUMNE WATER COMPANY, at Columbia, Cal., for building a cob-work timber dam on the South Fork of Stanislaus river, according to the plans and specifications on file in the company's office. Bids should be marked on the outside of the envelope, and will be opened on Saturday, September 4, 1897. The privilege of rejecting any and all bids is reserved. By order of Board of Directors.

J. B. POWNALL, Secretary.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from E. H. Adams, in the King Bird Mine, in Yuba Co., near Clipper Mills, to deposit tailings in Grizzly Creek; from J. T. Coffman and George T. Miller, in the Lost Camp Mine, near Blue Canyon, Placer Co., to deposit tailings in Blue Canyon, and from Mrs. E. A. Cox, in the Washington Mine, in Whisky Diggings, Sierra Co., to deposit tailings in Slate Creek, gives notice that a meeting will be held at room 59, Flood Building, San Francisco, Cal., on September 7, 1897, at 1:30 P. M.

OSBORN'S

Prospector's Field Book and Guide.

THIRD EDITION. JUST READY.

The Prospector's Field Book and Guide in the Search for and the Easy Determination of Ores and other Minerals. By Prof. H. S. Osborn, LL.D. 58 engravings. Third Edition revised and enlarged. 256 pages, 12mo.

☞ Price $1.50 by mail, free of postage, to any address in the world.

☞ A Descriptive Circular, illustrated, 4 pages, quarto, giving the full Table of Contents of the above volume, sent free to any one in any part of the world who will furnish his address.

☞ Our New and Revised Catalogue of Practical and Scientific Books, 91 pages, 8vo., and our other Catalogues, the whole covering every branch of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish us with his address.

HENRY CAREY BAIRD & CO.,

Office and Works, Cor. Beale and Howard Sts., SAN FRANCISCO.

MINERS, ATTENTION!

We beg to call attention to our "RISDON HAMMERED" Shoes and Dies, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density.

These Shoes will outlast any other make and will not chip or cup.

We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.

Our prices are as low as any, and the article we offer should commend it to all mine owners and mill men.

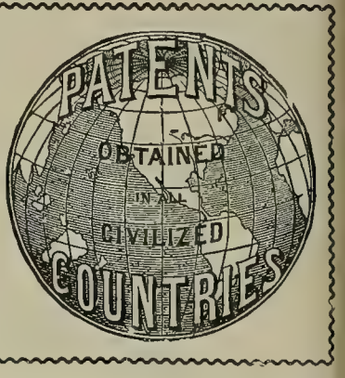
"Union" Hoist.

The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton125 feet per minute from an inclined shaft, or 1560 pounds at the same speed vertical lift. The drum will hold over600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

PATENTS



DEWEY, STRONG & CO'S PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

DEWEY, STRONG & CO.,
PATENT AGENTS,

CRIPPLE CREEK MINING DISTRICT

IS PRODUCING

Over $1,000,000 per Month IN GOLD.

Reached by

THE FLORENCE AND CRIPPLE CREEK RAILROAD,

THE GOLD BELT LINE

In Connection with the Denver & Rio Grande.

For information, address
C. F. ELLIOTT, General Traffic Agent,
DENVER, COLO.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PULLEY LOCKING DEVICE.—Wm. H. Kirkman, Berkeley, Cal., assignor to H. E. Poehlman, same place. No. 587,976. Dated Aug. 10, 1897. This invention relates to a device whereby pulleys may be locked, so as to prevent the return of a cord or rope passing over the pulley, so that when the weight is being lifted, or in conjunction with curtains and other such attachments, a cord may be pulled up and immediately locked when released. The result is effected by the employment of a grooved pulley having spiral locking channels, a shaft slidable through the pulley and movable in bearings, a yoke connected with the shaft having an opening through which the cord or rope passes from the pulley, a spring whereby the yoke is normally moved to one side with the opening out of line with the pulley groove, said spring yielding to allow the rope to move, so that it is brought into line with the pulley groove whenever the power is applied. Whenever the cord is released the spring acts to throw the yoke to one side, bringing the cord into position to be locked against the enclosing frame.

SHIP'S PORT VENTILATOR.—D. R. Rose, San Francisco, Cal. No. 588,480. Dated Aug. 17, 1897. This invention relates to an attachment for vessels which is especially designed for ventilating purposes and to allow the ports to be opened for the admission of air while preventing the ingress of water during rainy or stormy weather. The ventilator consists of a tubular tortuous passage adapted to project upwardly within the apartment into which the port opens, having a tubular flange projecting therethrough and forming a tight joint with the port opening, and also having a supplemental removable tube with diagonally disposed diaphragms within it, the whole serving to admit air and to prevent the admission of water from the outside.

GOVERNOR VALVE.—George E. Foster, Placerville, Cal., assignor of one-half to Geo. W. Kimble of same place. No. 588,415. Dated Aug. 17, 1897. This invention relates to a balance valve which is especially designed as a hydraulic valve for governors and for use in pipes through which water is flowing. It consists of a cock or valve extending transversely across a water pipe or way and turnable in its chamber, this valve having a cut-away segment which, when standing in line with the water passage, allows the water to flow on the side, and, when standing transversely, substantially cuts it off. A retaining valve is formed within the valve chamber and stands parallel with the axis of the valve, and a casing having its inner wall separated from the outer wall provides a circumscribing space within which the valve is surrounded and partially balanced in both its open and closed positions.

CARBURETOR.—Daniel Best, San Leandro, Cal. No. 588,381. Dated Aug. 17, 1897. This invention relates to improvements in devices for producing an explosive gas or vapor from hydrocarbons. This invention consists of a series of superposed shallow pans, with pipes extending upwardly through openings in the pans and connecting with the engine cylinder to allow the hot products of combustion to pass up through them. The pans have upturned rims and flanges, and have the means for feeding the oil into the upper part of the apparatus so that it will gradually flow down from one pan to the other, the heat forming a vapor, and air is mixed with this vapor, being received into an annular exterior channel around the carburetor, carried up to the top where it is admitted into the interior and thence passes down and mingles with the oil vapor to produce the explosive gas. At the bottom of the apparatus is a fireplace by which independent heat may be applied to commence the vaporization and formation of gas until the engine is fairly started, after which the exhaust from the engine keeps up the operation.

California's 44th Annual State Fair

WILL BE HELD AT SACRAMENTO, . . .

TWO WEEKS. September 6th to 18th, 1897.

THIS ANNUAL EXHIBITION will embrace a complete representation of the Agricultural, Mechanical and Industrial possibilities of the State.
MECHANICAL DEVICES can be here shown to a better advantage, and, if meritorious, receive recognition of value in placing them on the market.
THE EXHIBIT OF PRODUCTS from lands offered for sale, gives both sellers and buyers an acceptable opportunity to meet.
THE LIVE STOCK DEPARTMENT is eagerly sought each season by buyers desiring to replenish their herds with stock of new blood lines. This is necessary and insures sales to all exhibitors.
THE POULTRY EXHIBIT will constitute a most important division of this year's exhibition, and will offer a most excellent chance for buyers to view the various breeds of fowls in comparison.
THE DAIRY DEPARTMENT will have a complete working exhibit showing the latest methods in dairying, and the working of improved appliances. Competent instructors from some of the leading creameries in the State will be in charge to give instructions to all in this growing industry.
ELECTRIC POWER, space and light will be furnished free to exhibitors.
GRAND MUSICAL CONCERTS will be held each evening at the Pavilion by the **California Exposition Band.**
THE RACING PROGRAMME will form one of the leading features of amusement, and usually attracts a large attendance that are of benefit to all exhibitors.
TO MANUFACTURERS AND DEALERS we say exhibit your goods and wares, meet the public on neutral ground and profit by advertising in a practical way. The public attends these exhibitions in vast numbers to be instructed as well as amused.
FREE TRANSPORTATION for exhibits and excursion rates will be given by the Southern Pacific Company on all their lines.
Address the Secretary for special information. Send for Premium Lists.

WILFLEY CONCENTRATOR.

SEND FOR CIRCULARS.

Extract from letter of July 23d, 1897, from the Mine and Smelter Supply Co. of Denver, Colo., to Messrs. White, Rogers & Co., San Francisco, Cal.:

Mr. Reed, general manager Caroline Mining Co., Colorado, has 34 Woodburys. We have up to date sold him 8 Wilfleys, and we understand that he is to replace all of the Woodburys with Wilfleys.

We have just received a test run made between the Wilfleys and Woodburys at the Iowa Gold Mining and Milling Co., Silverton, Colorado, and give you the results:

WOODBURYS—24 hours; 1 oz. gold; 8.5 ozs. silver; 6 per cent lead; 1½ per cent copper; 12 per cent zinc; 60 per cent silica.

WILFLEYS—24 hours; 3 ozs. gold; 25 ozs. silver; 19 per cent lead; 6½ per cent copper; 17 per cent zinc; 10 per cent silica.

The Wilfley Table made 750 pounds more of concentrates than machines handling same quantity of pulp on the other side of the mill.

They have just ordered three more of the Wilfleys, and expect to take out jigs and put in Wilfleys in place of fine jigs etc., etc., etc.

Daniel Best Crude Oil Engine,
Kinkead Quartz Mill,
Smith Striking Stamp Mill.

Springer Ore Concentrator,
Truax Ore Cars,
Rock Breakers, Hoists, Etc.

Why the Springer Concentrator is the Best:

It will do more and cleaner work than any rubber belt machine.
It weighs only one-half as much as some of the six-foot concentrators.
Is the most simple in its construction of any machine in the market, and only one-third as many pieces in it as in some of the others. Was invented by an old miner of forty years' experience handling every known concentrator on the market.
Should any piece need repairing, it can be removed without disturbing any other part of the machine.
Can be set up by any inexperienced miner.
Its distributor is perfection itself, distributing the pulp evenly over the entire surface of the belt.
Grade of shaking frame can be changed while the machine is running at full speed.
It is the strongest, lightest running and most inexpensive to keep in repair of any
Will save more of the fine slimes than any other machine.
Is cheaper than any other six-foot machine, costing only $350.00 f. o. b. cars or boat, San Francisco.
Will handle the pulp from five stamps better than any other Concentrator.
Has adjustable eccentrics, and any length of stroke can be had, thereby giving different speeds per minute.
The belt is very durable, being made of No. 3 Canvas, woven especially for the Springer concentrator.
This machine requires so little attention that one man will easily attend to a dozen of them.
It has a solid rubber flange, which no other canvas belt has.
Wear and tear upon this machine is not one-third as much as upon some of the other concentrators

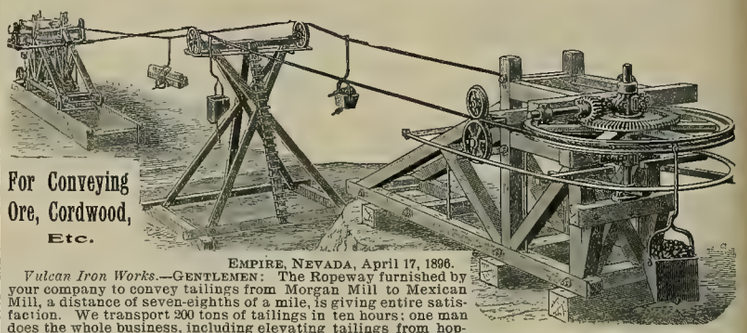
VULCAN ROPEWAY

—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.



For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours: one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, Aug. 26, 1897.

General trade continues to steadily increase in volume, with about every line of goods appreciating in value. High prices ruling for all kinds of farm products, with wheat in control of a big bull clique at the East and abroad, are doing no little in promoting a strong, healthy feeling in trade circles, as is also continued activity in gold mining on this coast. We dare venture the assertion that not in the history of this country have farmers been placed in position to cancel mortgages on farms, or, where they do not exist, to put so much money in the bank as this season, all due to advancing prices coming on at the commencement of a new season and before producers had marketed their products. It is an axiom of trade that the prosperity of this country is gauged by the farmer's income, which, if correct, ought to insure us very prosperous times for fully one year to come. Manufacturers, particularly ironworkers, speak quite hopefully of the future and express confidence that their business will show a very large increase the coming year.

The local money market continues to work on easy lines notwithstanding there is quite demand for crop moving purposes. There has been heavy warehousing of grain, particularly wheat, by speculators, shippers and farmer, on which advances have been made. As this goes out on export and home demand more takes its place. The money so placed soon finds itself into general circulation which relieves any symptoms of friction. It is confidently expressed that between now and the close of the year there will go into circulation in this State alone for farm products and from manufacturing and mining industries over $40,000,000. This large sum added to that already in general circulation will cause a more congested money market. The East reports active money markets at all trade centers particularly where speculation centers. The rates of interest do not show much appreciation so large is supply, but with grain, cotton and tobacco crops moving freely to market the demand for fruits ought to be very heavy. A leading New York authority writes: "Developments in the London market have of course revolutionized the European exchanges in the last week, as far as countries on a gold basis are concerned. It is worth noting that for the first time probably on record the Bank of Russia itself holds more than enough cash to pay off all its outstanding notes. At Rome the tendency of exchange is upward, although it is naturally not much affected by the advance in London discount. The same is true of Lisbon and Paris. The Indian exchanges have been wonderfully firm, and arbitrage in silver has been difficult to work, owing to an absolute panic in the bazaars which are quite disorganized and unable to quote prices with any certainty. The same is largely true as regards Shanghai where exchange is quite demoralized but tends all the time to keep below the silver point. A movement of the old Japanese yens is to be noted from China's circulation to Japan. There is, of course, large profit in returning this coin."

New York Silver Prices.

NEW YORK, August 26.—Following are the closing prices for the week:

	Silver in— London.	N. Y.
Friday	24⅛	52¾
Saturday	24	51⅞
Monday	24⅛	52
Tuesday	23⅞	51¾
Wednesday	23¾	51¾
Thursday	23¾	51½

London Sight Bankers	$4.86
Refined Silver, per oz. 1000 fine	51½
Mexican Dollars, nominal at	42

SILVER.—The market has fluctuated to lower figures, with a steadier feeling at the close. The shipments from Atlantic seaports continue free considering how low the white metal is. There seems to be an entire absence of any special demand either speculative or legitimate. If present good crop prospects in Argentina or India are realized in a large wheat crop, there will be a better demand for silver, particularly from India. The world's production of silver will show quite a falling off this year in comparison with last year. The very low price of silver is making itself severely felt with the copper mines that have a considerable output of the white metal. The last steamer for China took out $124,788 in silver bullion for Bombay.

MEXICAN DOLLARS.—The market is demoralized. Dealers hardly know what to pay, owing to the rapid declines the past two months. We doubt if over 40 cents would be paid for a round lot of new. The steamer for China took out 741,102 dollars. This is the heaviest aggregate shipment by any former steamer this year.

QUICKSILVER.—The market is slow, but fairly steady.

Our market is quoted at $38 for domestic consumption.

COPPER.—The market has held strong throughout the week. Our New York advices indicate still firmer prices, if the European and American consumption continues to enlarge. The very low prices ruling for silver may curtail the production of copper by some of the mines where the latter is an important factor.

Our market is quoted as follows:

Ingot casting, jobbing	13@—
Ingot " wholesale	12½@—
Sheet copper	—@16½
Bolt	¾ and 5-16, 20c; ⅜ and larger, 16½

TIN.—The market is easy, but not quotably lower. The demand is slower for pig.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

LEAD.—The market holds strong at a slight advance. The consumption at the East is enlarging, while the new tariff affects imports.

Our market is quoted in jobbing lots as follows per pound:

Pig	—	@	4 80
Bar	5 00	@	5 25
Sheet	—	@	6 25
Pipe	5 25	@	5 50

SHOT.—The market is firm.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs			$1 35
Drop, B and larger sizes,	"	"	1 60
Buck, Balls and Chilled, do,	"	"	1 60

POWDER.—The market is steady.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¾c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

COAL.—The market is practically unchanged. The demand for both steam and household is improving. For Australian, higher prices are asked for shipment.

We quote as follows:

SPOT FROM YARD—PER TON.

Wellington	$8 00	@	—
Greta	6 00	@	6 50
Nanaimo	6 50	@	7 00
Cuman	5 50	@	6 00
Seattle	5 50	@	6 00
Coos Bay	—	@	4 75
Cannel	8 00	@	—
Egg, hard	12 00	@	13 00
Wallsend	6 50	@	—

TO ARRIVE—CARGO LOTS.

Australian	5 50
Liverpool Steam	6 25
Scotch Splint	—
Cardiff	6 25
Lehigh Lump	9 00
Cumberland	13 00
Egg, hard	10 00
West Hartley	6 50

COKE.—The market is quoted as follows:

Gas Companies'	—	—	—
English, to load	9 50	@	—
" spot, in bulk	10 00	@	—
" in sacks	11 00	@	12 00
Cumberland	—	@	—

IRON.—The market has a better tone in sympathy with the East, where the markets appear to be hardening under a very active demand.

	AMERICAN. To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50
	ENGLISH.	
Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

ANTIMONY.—The market is steady.

Our market is quoted at 8¼c in a jobbing way. New York mail advices quote 7¾c for Cookson's, 7¼c for Hallett's and 7c for Japanese.

NAILS.—The market is steady with sales at quotations only made in small quantities.

Wire, carloads, basis per keg	
" jobbing, " "	$2 10
Cut, carloads, " "	
" jobbing, " "	2 00

BORAX.—The market is steady.

The market is quoted as follows:

Refined, in carload lots, in barrels	5
Refined, in carload lots in sacks	4¾
Powdered, in car lots	5
Concentrated, "	4½

PLATINUM.—The market is quiet.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

ZINC.—The market is steady.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

Chemicals.

There is absolutely nothing new to report. The liberal stocks of all kinds in jobbers' hands are against any advance in prices to meet the increased duties. It is said that round parcels can be obtained abroad at a sufficient reduction to meet the higher duties. Our New York advices state that blue vitriol and copperas show an advancing tendency. Outside of these the market is easy, with second hands offering to sell below importers' or agents' figures.

SULPHURIC ACID.—The demand is fair We quote in a jobbing way at 1½c per lb for 66%.

ACETIC ACID.—The market is firm at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported steady from store at 6½@7c per pound in carboys.

BLUE VITRIOL.—Our market is firm.

We quote in a jobbing way at 4½c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is firm.

Our market is quoted in a jobbing way at $1.50 a pound.

BONEASH.—The demand is good.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2¼c.

PHOSPHORUS.—The market is firm.

We quote in a jobbing way at 70 to 75 cents per pound.

SODA ASH, 58% (LeBlanc process).—The market is firm at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is firm at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—There is a fair demand at 2¼c a pound from stores.

NITRATE OF SODA.—Market is stronger.

Our market is quoted from store at 4c for 95%.

Mining Share Market.

SAN FRANCISCO, August 26, 1897.

The market ruled heavy, with the exception of Occidental, owing to light outside trading due to lively fluctuations in wheat causing more attention to be devoted to it. It is common report that many holders have sold so as to go into wheat. The strength in Occidental the past week is on reports of an improvement on the 550-foot level, with chances in favor of its resulting into something good. The chances, it is said, are also good on the 650-foot level. The impression prevails that shares of mines on the Brunswick lode will show more activity and probably be the next gamble. If reports are correct regarding the work, it looks as if such is in contemplation. It is stated that fewer men are at work in Con. Virginia on the Comstock and more men put to work on the Brunswick in the joint Gould & Curry, Best & Belcher and Con. Virginia workings. Exploiting work is being done on the upper levels of Chollar, particularly on the 200-foot level. This work ought to attract more attention to the Brunswick unless a good-sized body of ore should be uncovered on the Comstock lode. On this latter lode fairly active work is being done in several of the mines, while in the other either no work is being done or else it is prosecuted in a half-hearted way. What will follow John W. Mackay's return to the coast is conjecture, but his several visits the past ten years did not result in anything good to shareholders, who bank on his coming as the open sesame for a good-sized up-move. If nothing intervenes, Mr. Mackay is expected here the latter part of next week. As he has large business interests on this coast his presence ought not to count for anything in the share market unless it should be determined to show up a big body of ore and it is hardly likely this will be done with silver selling so low. The feature of trading the past two or three weeks has been the drawing up of the cats and after they have been advanced they do not go off to the low figures ruling before strengthening. From the Bodie district there is nothing to report regarding work, the mills or output of ore.

Our advices from the Comstock mines are practically unchanged. The work under way in several will result in ore strikes, mostly gold bearing, unless it is stopped, as it has been heretofore, just in time not to make a strike. They are still drifting north in Utah from the main west crossdrift. It has been extended over 200 feet. In Sierra Nevada they are still sinking below the Layton tunnel level. They are driving the north lateral drift slowly ahead. Nothing of interest is reported in the material passed through. Work is continued on the south drift from the upraise above the 900-foot level. In Mexican they are crossdrifting east on the 1000-foot level. As yet they have not found anything of value; but, as they did not expect to, they are not disappointed. In Ophir they are making slow progress in west crossdrift No. 3, 1000-foot level. They are in about 340 feet. They are still going south on the old Central tunnel level, started about 132 feet from the mouth of the west crossdrift ran from the sill floor. In Con. Virginia work is suspended on the 1000-foot level through the old Con. Virginia shaft. It is stated that the possibilities of this level were not exhausted, by any means. Active work is being done on the 1550-foot and 1650-foot levels in the same directions reported last week. Only low-grade ore has been found, or, at least, so far as made public. They are experimenting on low-grade ore; eighty-seven tons milled $13.11 per ton, but we are not advised what proportion, if any, was silver. Best & Belcher and Gould & Curry are still driving ahead to the east from the 800-foot Bonner shaft. There is no change in the Savage work. No work is being done in either Hale & Norcross or Chollar. They are still exploiting on the 100-foot level of Potosi. Only porphyry and low grade ore are reported officially. In Alpha they are taking out ore which goes largely silver, or, at least, the official letter says so. In an upraise from the 500-foot level it was found that the ore was less lower grade. When desired, it is stated, they can find high-grade, gold-bearing ore. From the joint west crossdrift of Con. Imperial, Confidence and Challenge no news of importance has come to hand, neither has there from the work in Confidence. In Crown Point, Belcher, Seg. Belcher and Overman nothing new has been received. The work is in the same directions reported last week.

From the Brunswick lode official advices report that the joint work by Con. Virginia, Best & Belcher and Gould & Curry is confined largely to exploiting work on the 300-foot and

"It is character, not circulation, that some advertisers want."
Very well. The MINING AND SCIENTIFIC PRESS has both.

600-foot levels. In Chollar the shaft is down to the 700-foot level. This level will probably be opened up. Exploiting work is continued on the 400-foot, 500-foot and 600-foot levels without any material change reported on either of the levels. There is a falling off in the number of tons of ore raised—last week there were only sixty-four carloads. The grade is also lower, the assays were only $11.83 gold and 13.96 ounces silver to the ton. Active exploiting and developing work is being done in Occidental on the 550-foot and 650-foot levels, with an improvement reported on both.

Assaying Gold .....AND..... Silver Ores.

By C. H. AARON.

THIRD EDITION JUST OUT.

A Standard Work.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents—Perface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press**, 330 Market St., San Francisco.

Assessment Notices.

MARGUERITE GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Auburn, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 28th day of July, 1897, an assessment (No. 7), of 10 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, 257 12th street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 10th day of September, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 11th day of October, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

F. METTMANN, Secretary.

Office—257 12th street, San Francisco, California. The Secretary will also receive payments from 12 to 5 P. M. at his business office, 225 Sansome street.

INYO MARBLE COMPANY.—Location of principal place of business, San Francisco, California; location of works, Inyo, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 27th day of July, 1897, an assessment (No. 30) of 16 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 323 Phelan building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of August, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on MONDAY, the 20th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

M. A. CAHN, Secretary.

Office—Room 323 Phelan building, San Francisco, California.

OSBORN HILL GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Grass Valley, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 4th day of August, 1897, an assessment (No. 6) of 35 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, room 11, No. 331 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of September, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 27th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. R. GRAYSON, Secretary.

Office—Room 11, No. 331 Pine street, San Francisco, California.

CONSOLIDATED CALIFORNIA AND VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 3d day of August, 1897, an assessment (No. 9) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to to Secretary, at the office of the company, room 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of September, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 29th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

OCCIDENTAL CONSOLIDATED MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 3d day of August, 1897, an assessment (No. 28) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 68, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of September, 1897, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on THURSDAY, the 30th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DURBROW, Secretary.

Office—Room No. 68, Nevada block, No. 309 Montgomery street, San Francisco, California.

GOLD RIDGE CONSOLIDATED MINING AND Milling Company.—Location of principal place of business, San Francisco, California; location of works, Nevada and Sierra Counties, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 3rd day of August, 1897, an assessment (No. 5) of 4 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, rooms 12 and 13, No. 43 Sixth street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of September, 1897, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 9th day of October, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

H. SYLVESTER, Secretary.

Office—Rooms 12 and 13, No. 43 Sixth street, San Francisco, California.

RED CAP MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Red Cap Creek, Humboldt County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 25th day of August, 1897, an assessment (No. 1) of Nine Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, No. 125 Beale street, City and County of San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of October, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 23d day of October, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. deK. TOWNSEND, Secretary.

Office—125 Beale street, City and County of San Francisco, California.

THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,

330 Market Street..... San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.

Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid..... $1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid..... $1 75

Notes on Assaying and Assay Schemes.

By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth..... $3 00

Prospector's Field Book and Guide.

By H. S. Osborn..... $1 50

A Practical Guide for Prospectors and Miners

By C. W. Moore. With numerous illustrations..... $4 75

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid..... $3 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.

With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth..... $5 00

Modern Copper Smelting.

By Edward Dyer Peters, Jr. Seventh edition. Rewritten and enlarged. Profusely illustrated.... $5 00

Electricity in Mining.

By Sylvanus P. Thompson..... 80 cts.

Practical Treatise on Hydraulic Mining.

By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc Price, postpaid..... $5 00

Practical Hydraulics.

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Metallurgy of Silver.

By M. Eissler. Profusely illustrated..... $4 00

The Explorer's and Assayers' Companion.

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid..... $6 00

Aaron's Leaching Gold and Silver Ores.

By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid..... $3 00

Manual of Assaying—Gold, Silver, Copper and Lead Ores.

By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 533 pp. Price, postpaid..... $2 50

The Metallurgy of Gold.

By M. Eissler. Profusely illustrated..... $5 00

A Text Book of Mineralogy.

Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth..... $3 50

Notes on the Treatment of Gold Ores.

By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth..... $2 00

A Practical Manual of Minerals, Mines and Mining.

By H. S. Osborn..... $4 50

Cyanide Processes for Gold and Silver Ores.

By E. B. Wilson, E. M. 12mo., cloth..... $1 50

Practical Metallurgy and Assaying.

By A. H. Hiorns..... $1 50

The Practical Metal Worker's Assistant.

By Oliver Byrne. Illustrated..... $5 00

Quartz Operator's Handbook.

By P. M. Randall..... $2 00

Assayer's Guide.

By Oscar M. Lieber..... $1 50

Assayer's Manual.

By Bruno Kerl. Illustrated..... $3 00

Metallurgy of Silver, Gold and Mercury in the United States.

Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo..... $7 00

Metallurgy of Silver, Gold and Mercury—Continued.

Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth..... $7 50

Manual of Determinative Mineralogy.

With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth... $3 50

Skeleton Mining Report.

Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid....50 cts.

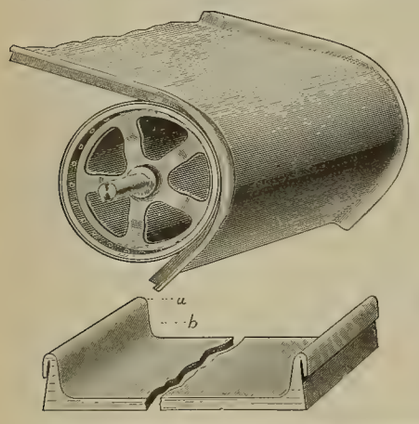
Stamp Milling of Gold Ores.

By T. A. Rickards, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid..... $2 50

Miners' Pocketbook.

A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. Warnford Lock. 472 pages, illustrated, flexible leather..... $5 00

THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.



It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

ORIGINAL EMPIRE MILL & MINING COMPANY,
GRASS VALLEY, NEVADA CO., CAL., Feb. 20, 1897.

JAS. S. BROWNELL, ESQ., San Francisco, Cal.—DEAR SIR: The Brownell Patent Lip flange belt for ore concentrators, which I bought of you nearly two years ago, has been in constant use and is in good order and gives us perfect satisfaction. We have several other kinds of belts in the mill, and your belt and flange I consider the best of all. Yours respectfully, ROBT. WALKER, Superintendent.

ROANOKE MINING COMPANY,
MOKELUMNE HILL, March 4, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: We have in our 20-stamp mill at this place five Frue vanners; three of these are equipped with the Patent Lip flange belt and two with the plain flange belt. We certainly consider the former a great improvement on the latter. They will certainly wear much longer, as cracking now seems out of the question. Any one purchasing the Frue vanning machine should see that it is equipped with the Patent Lip flange belt. Very truly yours, ROANOKE MINING COMPANY.
Per G. M. WILDE, Acting Superintendent.

ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Cal State Library 2 1 '97

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.

"The roasting is inv... good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month re... which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.

"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it.
"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The ROPP FURNACE is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal; (one furnace); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); and Broken Hill Proprietary Co., Broken Hill, New South Wales (two furnaces).

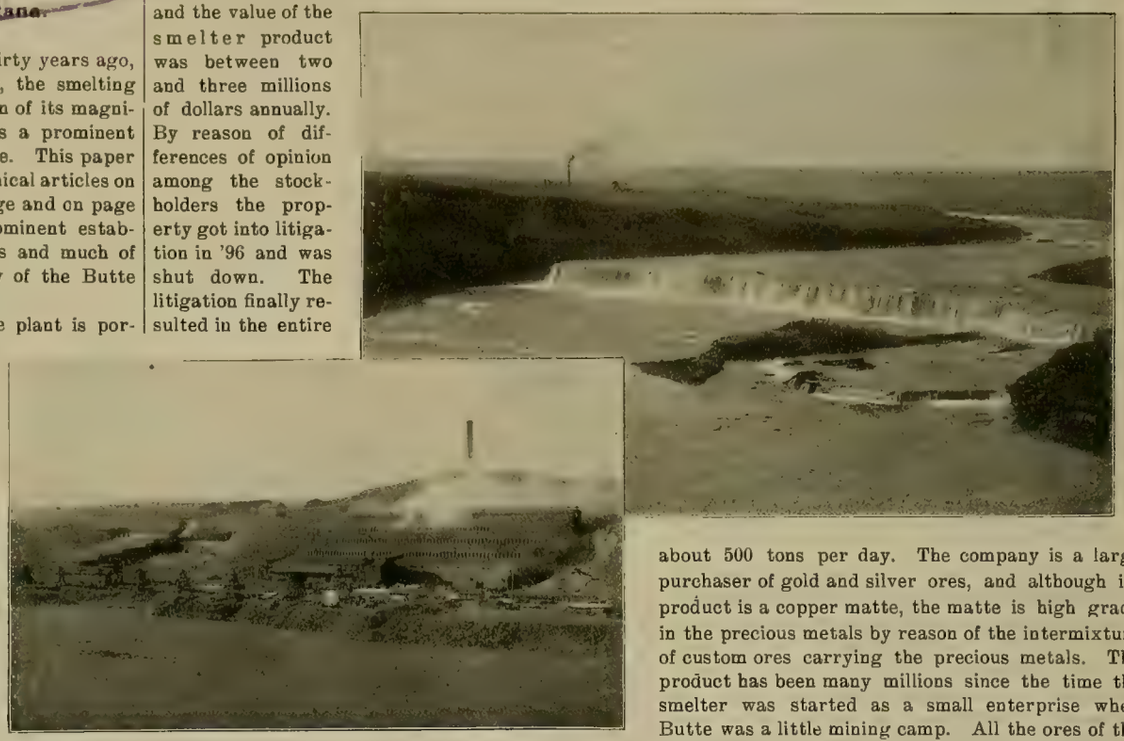
Smelters of Butte, Montana.

Beginning in a small, crude way thirty years ago, with a windmill fan for a blast-blower, the smelting industry of Butte, Montana, by reason of its magnitude and annual output, now occupies a prominent place, handling daily 7000 tons of ore. This paper has repeatedly published expert technical articles on the mode of operation and on this page and on page 216 gives some views of the more prominent establishments, being indebted for the cuts and much of the descriptive matter to the courtesy of the Butte *Bystander*.

The Boston and Montana Co., whose plant is portrayed on this page, is the second greatest concern of the kind in Montana. Its principal mine is the Mountain View. The concern has paid about $4,000,000 in dividends in the ten years of its operation; it annually produces about $5,000,000 in copper, carrying some silver, and owns the $2,000,000 smelting plant as shown at Great Falls. Capt. Thos. Couch, who projected the first operations of the Merced Mining Co., at Coulterville, Mariposa Co., this State, was the original factor in organizing this big Montana company.

The Butte and Boston smelter is also shown on this page. In 1888 the Butte and Boston Mining Company organized to work mining properties in Butte purchased from A. J. Davis. The number of claims bought was thirty-three and the price paid was about $1,250,000. In the purchase was included a fifty-stamp silver mill, some of the properties being silver mines, and to work the ore product of the copper mines a smelter was built having a daily capacity of 500 or 600 tons. C. H. Palmer became manager; for several years the mines were very productive and the value of the smelter product was between two and three millions of dollars annually. By reason of differences of opinion among the stockholders the property got into litigation in '96 and was shut down. The litigation finally resulted in the entire property being sold at receiver's sale, the price at which it was bid in being in the neighborhood of $3,000,000. The company's mines have an abundance of pay ore, among the richest in the Butte district.



THE BOSTON AND MONTANA CO.—WORKS AT GREAT FALLS.

On page 216 is shown the Colorado smelter and concentrator. The Colorado smelter was the first to treat Butte ores successfully by smelting, twenty years ago; the capacity of the works at that time was twenty-five tons daily. Now the capacity is about 500 tons per day. The company is a large purchaser of gold and silver ores, and although its product is a copper matte, the matte is high grade in the precious metals by reason of the intermixture of custom ores carrying the precious metals. The product has been many millions since the time the smelter was started as a small enterprise when Butte was a little mining camp. All the ores of the Gagnon were till recently transferred from mine to smelter on wagons. The Butte Street Railway Company laid a track from the mine to the smelter, equipping the new line with electric ore trains, and now the ore is transported by rail to its objective point. On the same page is a cut of the Montana Ore Purchasing Company's Works at Meaderville. F. A. Heinze is the originator, promoter and manager of this company. The first plant treated 100 tons of ore per day. That was in 1893. Since then the plant has been increased in size; its present capacity is 500 tons per day and its production between two and three million dollars annually.

THE BUTTE AND BOSTON SMELTER.

The Butte Reduction Works has been in operation for ten years. It was originally the property of a stock company, but in 1890 was bought by W. A. Clark for $300,000, who since then has owned and operated it. Until '96 its capacity was 150 tons per day; improvements now give it a daily capacity of 500 tons. Its chief ore supply comes from the Colusa Parrot and the Original mines.

The Parrot smelter, shown on page 216, has been in operation about fifteen years. It has a capacity of 500 tons per day and was the second smelter built in Butte (the Colorado being first) and was the pioneer in the resmelting of copper matte in converters, which reduces it to a practically pure copper. The company is building a new and larger smelter near Whitehall in Jefferson county, with a daily capacity of 1000 tons of ore, the second largest in the Northwest. The ore is carried from the Butte mines to the smelter by the Northern Pacific railroad.

Patents for Pacific Coast Inventors; Notices of Recent Patents, 230.

River Improvement, Etc.

It is a matter of ancient history that the California Legislature some years ago appropriated $250,000 contingent upon a like amount to be appropriated by the national Congress. It is fast becoming a matter of equally ancient chronology that such amount was so appropriated. A $300,000 appropriation for a dredger also graces the State statute books. It took about six years of steady effort on the part of this paper, assisted by other deserving journals, to get these appropriations. It also took a concert of effort on the part of mountain and valley residents, and a vast amount of mutual deliberation and concession. It was with no small degree of satisfaction that the successful result of all this work was announced; such satisfaction is regretfully absent from this present statement, because of the fact that, beyond the payment of sundry clerical salaries and the voluminous reports, there is so far no active movement.

Meanwhile the seasons come and go, another winter is at hand, and nobody is growing younger. It was believed at the time the securing of the money was the order of the day that the matter was not generally viewed as a heritage to posterity, nor is that view popularly held now.

We have a National River Board and a Board of Public Works, Commissioners, Auditing Boards, Engineers, Secretaries, Chairmen, etc., aggregating considerable combined talent. The office work is admirable, the reports are models of topographical skill, the correspondence and discussion afford interesting reading to those who like that sort of thing, but some objective evidence of progress is earnestly desired. The State has already spent a great deal of money in preliminary work, including surveys, and it was supposed that as soon as the appropriation was secured that the era of talk and getting ready was past, and that actual work could begin. In this regard it is understood that executive objection to rendering the money immediately available had been overcome.

Judging from recent reports published in the Sacramento papers it seems that the dredger idea is now considered secondary to a jetty scheme which becomes the main proposition. Judging from other published comment it seems to be the prevailing idea in some quarters that the State authorities have charge of the whole work of river improvement and dam construction.

The following is deemed worthy of recital:

In '91 a commission of Government engineers made report to Congress recommending an appropriation; in '93 Cols. Mendell, Heuer and Benyaurd, U. S. Government engineers, made similar recommendation; in '95 they renewed that recommendation. Thus we find that obstructions in the Sacramento, Feather and Yuba rivers in this State, occasioned three successive official reports to Congress by U. S. engineers instructed to examine and report. Each time the report by these U. S. engineers was accompanied by a recommendation that $300,000 be appropriated to begin a plan agreed upon and designed by these U. S. engineers. This State on March 24, '93, appropriated $250,000 contingent upon a like appropriation from Congress. That appropriation was made on June 2nd, '96. Another appropriation of $300,000 was made by the State Legislature April 3rd, '97, for a dredge.

The joint appropriation of $500,000 by the State and nation was for the construction of a debris restraining dam—not for the impounding of fresh debris or for miners to use as a tailings dump, but to stop the seaward movement of the detritus mined twenty-five years ago. Hydraulic miners, under the Caminetti act, must continue to build their own dams and take care of their own debris.

It is in order to observe that money can only be obtained from the national treasury for river improvement on a report and recommendation of Government engineers appointed for that purpose, and that money so appropriated can only be expended by Government engineers who direct the work, supervise it and audit the accounts—that is, every dollar must be spent under the exclusive supervision of U. S. engineers.

Following is the language of the national appropriation:

For the construction of restraining barriers for the protection of the Sacramento and Feather rivers in California, $250,000; such restraining barriers to be constructed under the direction of the Secretary of War, in accordance with the recommendation of the California Debris Commission, as contained in executive document No. 16 (H. R.), Fifty-third Congress, second session, pursuant to the provisions of and for the purpose set forth in section 25 of the Act of Congress of the United States, entitled "An Act to create the California Debris Commission and regulate hydraulic mining in the State of California," approved March 1, 1893: *Provided*, That the Treasurer of the United States be and he is hereby authorized to receive from the State of California, through the Debris Commissioners of that State, or other officer thereunto duly authorized, any and all sums that have been or may hereafter be appropriated by said State for the purpose set forth, and said sums, when so received, are hereby appropriated for the purpose above named, to be expended in the manner above provided.

It will be noted that the $250,000 appropriated by the State and the $250,000 appropriated by Congress is under the sole supervision of the U. S. engineers composing the California Debris Commission; and that the State has no control or say as to how a single dollar of the amount shall be expended. It is to be further noted that the appropriation was made under section 25 of the Caminetti act, which is as follows:

SECTION 25. That said Commission (the California Debris Commission), in order that such material as is now or may hereafter be lodged in the tributaries of the Sacramento and San Joaquin river systems resulting from mining operations, natural erosions or other causes, shall be prevented from injuring the said navigable rivers or such of the tributaries of either as may be navigable and the land adjacent thereto; is hereby directed and empowered, when appropriations are made therefor by law, or sufficient money is deposited for that purpose in said debris fund, to build at such points above the head of navigation in said rivers and on the main tributaries thereof, or branches of such tributaries, or at any place adjacent to the same, which in the judgment of said Commission will effect said object (the same to be of such materials as will insure safety and permanency), such restraining or impounding dams and settling reservoirs, with such canals, locks or other works adapted and required to complete same. The recommendations contained in executive document numbered two hundred and sixty-seven, Fifty-first Congress, second session, and executive document numbered ninety-eight, Forty-seventh Congress, first session, as far as they refer to impounding dams, or other restraining works, are hereby adopted, and the same are directed to be made the basis of operations.

Thus there is at present available $500,000 for the work to be done under federal governmental supervision. Recent changes in the personnel of the U. S. Commission and the press of other work cause a regrettable delay in the active prosecution of the plan from which so much was expected. It is some satisfaction to know that whenever the Commission get ready to move, they have half a million dollars at their disposal. It is to be said that there is a possibility that the State authorities are dilatory in hopes that their inaction may cause the federal authorities to take hold of the work involved in the $300,000 State appropriation. The unfortunate fact remains that, while State and nation have appropriated $800,000, nothing is being done. It is clear from the above that the Debris Commission has jurisdiction in the $500,000 appropriation, and the State authorities in the $300,000 appropriation. Those whose province and pleasure it was to secure such appropriations have certainly done their duty; it would be eminently satisfactory to be able to chronicle the fact that at least a beginning had been made in this most urgent work.

California Miners' Association.

The approaching annual session of the California Miners' Association bids fair to be, in many respects, the most important meeting ever held by that body. That we are on the eve of a great awakening in the mining industry of California no longer admits of a doubt. In fact, we are entering the first stages of it now. The eyes of the world are upon California, and mining investors who have been following the alluring but disappointing visions that have appeared from time to time in other lands are now turning toward our Golden State for safe investment and legitimate returns. This desirable result is in no small degree attributable to the earnest and extended efforts of the California Miners' Association. Organized in January, 1892, the association has steadily advanced the mining industry along safe and conservative lines until it has attracted the favorable attention of the better class of mining men throughout the world.

The work of the Association, however, is by no means complete. It has just reached that point where exceeding care must be exercised in order to preserve and extend the benefits already obtained. The gratifying results obtained from both our State and national legislatures in behalf of hydraulic mining need to be supplemented by further legislative aid before the final results so earnestly desired can be deemed assured. The needs of an executive Department of Mines and Mining are becoming more apparent as the mining industry advances. The necessity for a revision of our federal mining laws can no longer be overlooked; there should be no abatement in the efforts of the Association to preserve to the mining prospector the mineral lands within the railroad land grants. These are some of the matters that must at once engage the attention of the Association, and their importance can scarcely be overestimated.

It will thus be seen that the work of the Association increases, rather than diminishes, as the years go on. This leads to another matter that may not inappropriately be referred to at this time.

No work looking to the substantial upbuilding of any great industry can be carried forward successfully without the expenditure of more or less money. Although the California Miners' Association has been extremely fortunate in the assistance it has received in the way of gratuitous service, professional and otherwise, it has been compelled to incur a considerable expense in the large amount of work which it has carried forward. This expense has been borne quite largely, heretofore, by the merchants and manufacturers of San Francisco, while the miners and mine owners throughout the State have not, as a whole, contributed their proportionate share. A few mining counties, notably Placer and Nevada, have contributed substantially to the cause, but the great majority of the mining counties have but poorly responded to the cry for help.

On the other hand, the mining counties, through their respective delegations, have continuously had a majority of the delegates attending the annual meetings and have thus controlled the policy of the Association and the selection of its officers. It is, of course, right that the miners themselves should have the controlling voice in the affairs of the Association. At the same time they should not neglect to contribute their due proportion toward the expenses of the organization that has done, and is still doing, so much for them.

Concentrates.

MEXICO is about to impose an export duty on gold.

THE increased price of lead is the only present lining to the cloud over the silver camps of the coast.

THE gold dollar of 1792 had 24¼ grains of pure gold. In 1834 it was reduced to 23 1-5 grains of pure gold.

THE *Bedrock* (Or.) *Democrat* estimates the output of the Baker City district will exceed $2,000,000 this year.

AIR can be easily liquefied, but it must be stored and transmitted at a temperature of more than 200° below zero.

OWING to a shortage work on the Montana school of mines has ceased. Butte will probably contribute enough to finish it.

THE Florence, Colorado, cyanide works now have a daily capacity of 400 tons—the largest works of the kind in the country.

ENGLAND'S colonial plan has changed since the days when discoverers of gold in Australia were punished for their presumption.

COLORADO men now propose to erect electrical works in Clear Creek valley to generate power to be used in the Idaho Springs mines.

THE law allows eight men to hold 160 acres placer claims and considers $100 worth of annual work or improvement sufficient to hold the tract.

"CONCENTRATES" is unable to tell with exactness when and where the copper plate was first introduced in the California quartz stamp mill.

GOLD in barite has been found at Big Bend, Butte Co., Cal. It is frequently found associated with talc schists, notably in Sierra and Mariposa counties.

THE Los Angeles Mining and Stock Exchange is about to occupy larger quarters. It has 100 members, and over 500,000 shares of stock were sold in August.

SO LONG as present conditions prevail, the Horn Silver mine at Frisco, Utah, will continue to market its high-grade lead ores and maintain the present pay-roll.

AMONG the "rush" to Trinity Co., Cal., last month were several prospectors who will be heard from later on. The prospector can be usually depended on to find what is in a country.

ON May 29, '96, the President vetoed the $250,000 appropriation for restraining dams; on June 2, '96, the House passed the bill over his veto and the next day the Senate did likewise.

VISITORS to San Francisco will find it well worth while seeing the mining and milling machinery, etc., exhibit at the Mechanics' Institute Exposition at the 9th and Larkin Sts. Pavilion.

THE British Yukon Company of Montreal announce that they will start the building of a railway from Skagaway to the headwaters of the Yukon this fall and finish it by the fall of 1899.

OUR Alaska special correspondent who has reached St. Michaels has some items on page 219 of this issue. From Dawson City are received four photos, which will be engraved for next week's issue.

UTAH dealers in explosives have lowered prices one cent per pound in the general movement there to give the silver miners a chance to continue. Giant powder is now quoted in Salt Lake City at 15 cents.

MOSCOW, Idaho, papers make the unusual statement that the big wheat harvest there has made such high wages that the mining companies have had to stop on account of scarcity of labor, as "all classes are taking to the harvest fields."

THE West Colusa shaft of the Butte and Montana Co. is the largest in Montana—17½ feet in the clear. Double-deck cages large enough to admit two cars standing side by side are used. The company proposes sinking it to a depth of 2000 feet.

LARGE quantities of gold are coming to San Francisco from Australia. The Mariposa last week brought nearly $2,500,000. Last Sunday the steamship Moana sailed from Sydney, N. S. W., with 600,000 sovereigns for this city—nearly $3,000,000 more.

THE gold output at Witwatersrand, South Africa, according to a cable, in July was 242,479 ounces, a decrease of 9050 ounces as compared with the previous month's total, and an increase of 38,606 ounces as compared with the corresponding month of last year.

GEO. SIMMONS claims to have discovered a turquoise mine twenty miles from Vanderbilt, Cal. What were supposed to be the only turquoise mines in the United States—in New Mexico—were recently illustrated and described in a special article in this paper.

THE Broken Hill Proprietary Co. of N. S. W., the largest silver producing concern, in its half-yearly report at the meeting held in Melbourne on July 30th, show that during the six months there were treated 201,016 tons ore, yielding 13,438 tons lead, 3,826,873 ounces silver, 1825 ounces gold and 313 tons copper.

LAST week, in letters three inches long, the dailies announced that the steamer Portland was hourly expected from St. Michaels, Alaska, with several tons of Klondike gold—three million dollars at least. When the Portland did arrive 'twas with about $100,000—about the average monthly clean-up of one California mine.

KLONDIKE investment companies have organized in several large cities, and even in San Francisco those fake schemes are being advertised. It is hardly necessary to say that any well regulated faro game or lottery affords better inducements for investment than those games, wherein the gudgeon is expected to bite at a bare hook.

SOME of the letters received in town inquiring as to the overland route to the Yukon are unconsciously humorous and display a startling state of ignorance of our great north land, says the Edmonton *Bulletin*. One inquirer asks if he could get through on his bicycle and another inquires if there are good boarding houses on the way and if the Indians are troublesome.

TWO LOTS of gold from the Klondike, the first ever received there, were assayed at the New York Assay Office in Wall street last Wednesday. One lot, weighing 44.45 ounces, assayed .749 per cent fine gold and .246 per cent silver, which made the value $15.48 an ounce. The other lot, which weighed 10.6 ounces, assayed .830½ fine gold and .174 silver, making the value $16.95 an ounce.

THAT is an interesting suit begun by the Montana Ore Purchasing Co. against C. S. Batterman. He is now superintendent of the Boston and Montana M. Co., but was employed by the plaintiff two years, during which time he made underground surveys and superintended operations. Plaintiff alleges that he has given the B. and M. M. Co. information obtained while in plaintiff's employ and sues for damages.

WHEN one is in the employ of another in a certain line of work, and devises an improved method or instrument for doing that work, and uses the property of his employer and the services of other employees to develop and put into practical form his invention, and explicitly assents to the use by his employer of such invention, the court held that he had given to such employer an irrevocable license to use such invention.

NORTHERN CALIFORNIA papers are having a good deal of quiet fun over the "boom" articles in San Francisco dailies about Trinity county. The papers in that section have been truthfully chronicling strikes and discoveries there week by week and are not objecting to the interest manifested, though they naturally dislike to see so many well-meaning people fooled, as such reports tend to discredit the truth when soberly stated.

THE coinage of the San Francisco Mint during August was very large, 3,331,500 pieces, the largest number of pieces ever coined there during a single month, the value being $5,810,000. In amount of deposits, August, 1897, breaks all records. The value of the gold deposited that month was $8,030,746.70. The Klondike gold and Australian coin deposits have helped out in this, but the greater part of the gold was the product of California mines.

THE St. Louis *Globe-Democrat* devoted a page recently to the "Clean Shirt" mine, which the writer says contains millions of tons of gold ore going $1000 per ton. Nobody can work it on account of the spooks of prospectors killed there in '60 by Piutes. The "Clean Shirt" belongs to Jas. Barron, and is located in Eagleville, Nevada. The story was, as usual, a "fake," but caused seventeen Missourians to write to Wadsworth, Nevada, making inquiries about the property.

ON the second day of January this year the silver and lead quotations were as follows: Silver, 64⅞c; lead, $2.90. To-day's quotations are: Silver, 51½c; lead, $3.85; brokers' exchange $4.22½. In eight months the decline in silver has been about 21 per cent, the advance in lead 37 per cent. The low-grade ore mines of Bingham, Utah, for instance, with a by-product of silver, are to-day receiving more money for their product than at any time within a period of three years past.

ANY miner or prospector who has a blow pipe, alcohol lamp and a few drops of cold sulphuric acid can, in a few minutes, determine whether tellurium is present in ores. All that is necessary is to break off a small piece of the ore, place it in a small porcelain dish previously warmed so as to avoid breaking, apply the blow pipe until the ore is at an oxidizing heat, then one or two drops of sulphuric acid on porcelain dish; allow to mix with the ore. The reaction will immediately follow, if tellurium is present, by beautiful carmine and purple colors.

THE Boston News Bureau says: Parties in a position to know confirm the reports of heavy sales of copper for export to France. It appears that representatives of the French Government and other foreign consumers recently asked the Calumet & Hecla for a price on 40,000,000 pounds or 20,000 tons. The Calumet people named 11¾ cents as their lowest figure. Thereupon the Frenchmen bid 11¼ cents, which offer was promptly refused. After waiting a number of days, the Calumet's term was finally accepted. This sale is said to mean 11½ cents for ingot copper right away.

SUPERVISORS of California mining counties are passing the following powder ordinance: Section 1. No person shall keep, store or have in any building, structure or place, within one-fourth of a mile of any inhabited dwelling house or county road in the county of ——, State of California, more than ten pounds of gun powder, more than ten pounds of Hercules powder or more than ten pounds of blasting powder, or more than ten pounds of dynamite or more than ten pounds of giant powder. The recent fearful explosion at Georgetown impels such precautionary measure.

COAL is being mined under the sea on the north coast of the Spanish province of Asturias. A seam is opened there which extends an unknown distance, the workings now being in 660 feet. The mine is reached by a vertical shaft, whose surface is 65 feet above the sea, and the bottom 185 feet below it. With the necessary machinery room after room is opened in succession, slices 10 feet long are taken out, and when the full thickness of the seam has been removed the roof is made secure by building a dry stone wall from 3 to 5 feet thick against the pillar of coal left standing. The space behind is packed solid with stone, for timber is out of the question in such a thick seam. Each miner digs from two and one-half to three tons per day.

WHERE 750 feet of water is to be carried in a canal, a foot of water being the amount that will flow through an opening a foot square under four inches pressure, or one cubic foot per second flowing through an opening of fifty square inches, the water will move 12 feet per second, or 8 2-11 miles per hour. To prevent washing the channel, water next the bed must not move faster than the following table for the different materials: Soft clay, one-sixth mile per hour; fine sand, one-third mile per hour; sand as large as peas, one-half mile per hour; gravel as large as beans, two-thirds mile per hour; gravel one inch in diameter, one and one-half miles per hour; pebbles one-half inch in diameter, two and one-fourth miles per hour; heavy shingle, two and three-fourths miles per hour; soft rock, three and one-fifteenth miles per hour.

A WRITER in a Parisian journal points out that Russia occupies an interesting position as a gold producer. She is gradually feeling her way from a silver standard to a gold, and she is herself the fourth largest producer of the more precious metal. It is estimated that eastern Siberia, including the region of the Yenissei, will alone give an annual production of gold of the value of $15,000,000. With the completion of the Transsiberian line, there will be four great and steady producers of gold—the United States, South Africa, Australia, and Siberia, with her neighboring Chinese territories. Besides these, there must continue to exist a number of other producers, like Brazil, the Guianas, British Columbia, Mexico, Germany, Austria-Hungary and Bolivia. But these, he believes, can never seriously compete with the four producers just named.

THE recent decline in silver affects the treasury. The present available cash balance, as given in the official treasury statement, is in round numbers, $222,000,000. In estimating this balance on hand, the government stock of silver bullion is reckoned at its original cost, instead of its present market value. The amount of this silver bullion now on hand is $114,000,000, giving it the value of its original cost. But considering the present market value of silver, this bullion would not sell for more than $60,000,000. Aside from this a large part of the cash balance is made up from standard silver dollars now held in the treasury, each one of them being counted as a full dollar. The amount of this coin silver is $391,000,000. The government stamp upon these coins gives them their dollar value in current circulation, but, if they were measured at their actual bullion value of about 40 cents each, this asset of the cash balance would also suffer a shrinkage. The two items of coined and uncoined silver amount to $505,000,000, and it is at this amount that it goes onto the credit side of the cash balance. At its market value, however, it would be worth only $252,000,000.

AT the Argent mine, Tasmania, a Bartsch circular percussion table is in operation. The machine consists of a cast-iron table 13 feet in diameter, convex in form, and turned smooth on the surface. It is vibrated by cams worked by a shaft underneath. The separation of the minerals from the gangue is by water currents, supplied by a curved water pipe, revolved slowly over the surface of the table. Receptacles at the outer rim of the table receive the several grades of concentrates. The ore is fed on to the table with water, and runs in a curved direction toward the outer edge of the table. On its way the stream is reduced in velocity and depth to about one-third, owing to the greater surface covered, causing a separation of the lighter and heavier particles. The former leave the table at once, while the latter are further separated by passing under the stream of water from the rotating curved water pipe, which, assisted by the vibrations of the table, with gradually increasing energy and velocity, separates the various materials according to their specific gravity and washes them into the rotating delivery receptacles, and from thence into circular troughs, which collect the different grades of concentrates. The daily capacity of the machine is from 12 to 15 tons.

UNDER the head of "Vicarious Mining" the Chicago *News* sarcastically suggests that any one who may wish to participate in the vast new riches of the Klondike region need not by any means give up a comfortable home and the incidental advantages of having something to eat during the winter. All needed is to take a few shares in the Colossal Consolidated Klondike Company at anywhere from 10 cents to $1 a share, according to the nerve of the promoters and the financial capacity of purchaser. There need be no fear that this style of being engaged in the exciting pursuit of Alaskan wealth will not be put within the reach of all. It always is. Some kinds of financial venture are necessarily limited to the rich and favored, but not so the mining venture. A good many citizens have a taste for these engravings. In selecting a certificate two points should be borne in mind. First, the color. Experienced men who have made a large collection say that the light-brown engravings, while they take the eye at first, are apt to fade. Their advice is to insist upon a rather dark shade of green as being the most lasting. The next consideration is size. Always get as large a certificate as possible, and peremptorily reject those which are less than 30 inches in length. As to cost—one can get just as pretty and lasting a certificate for $1 as for $1000.

A PARAGRAPH in the London and China *Telegraph*, London, June 21, 1897, reads: Some details furnished to the Geographical Society of Paris confirm the statements made from time to time as to the value of the gold deposits in Siberia. The particulars were given by M. E. D. Levat, C. E., who went over the ground in the company of a Russian engineer, M. Th. Sabachnikoff. They state that an immense development of the gold placers has been carried on between the Ural and Vladivostock. Nowhere in the world, states M. Levat, are there such vast stores of gold and spread over so large a surface. Eastern Siberia at present produces between 135,000,000 and 150,000,000 francs of gold, without taking into account what is clandestinely exported. In the Amoor province at least a quarter of the production is so dealt with. The majority of the mines are situated far from the Amoor, from whence stores and provisions have to be drawn and considerable transport difficulties are experienced. Work can only be carried on for about 100 to 120 days in the year—say from May to September—for the indispensable water is frozen hard for the rest of the time. During the cold season, however, prospecting is carried on. No medal is without its reverse. The smuggling of gold is reduced to a fine art. Entire villages exist of gold stealers, who are practically free, as the result of the immense distance open to their enterprise. If caught, they affirm the gold comes from China. Even on the Russian gold fields, theft by the workmen can not be prevented, and their methods of disposing of it are elaborate.

RECENT PROGRESS in the chlorination process lies mainly in the direction of improvements in the mechanical appliances. Repeated efforts to prevent the oxidizing action of the chlorine upon the unroasted sulphide in ores, by adding nitre, have not been satisfactory. One of the improvements in chlorinating has been the increasing of the size of the lead-lined barrels which contain the charge of ore. Formerly five tons was the maximum quantity used in one barrel, now ten tons are placed in suitable sized barrels. Regarding the filter made of asbestos cloth which was previously used, this has given place to a substitute, in the shape of a deposit of cheap sand which does not require to be removed until about one hundred charges have been put through. The old asbestos cloth was expensive and was only available for a few charges. In Australia the barrel system has been almost entirely abandoned and in its place vats have been erected once more, the average containing twenty-five tons of ore per charge. Chlorine gas is not used in the chlorination works at the Mount Morgan mine, Australia; chlorine water being employed on account of a lesser consumption of chemicals, as well as a better control of the reagent. The use of bleaching powder combined with sulphuric acid for generating chlorine is superseded by the employment of manganese dioxide, salt and sulphuric acid and the installation of chlorine stills, towers and solution tanks. The success which has attained by these methods is shown by the statement that the percentage of extraction at the mines referred to are equal to 95% of the total ore value, and the cost is stated as being equal to $3.00 per ton, a figure which it is expected will be decreased with the use of the revolving roasting furnaces.

River Dredging for Gold.

Written for the MINING AND SCIENTIFIC PRESS by R. H. POSTLETHWAITE.

Regarding river dredging for gold, I find from my own observation, and also from the letter written by Mr. Richards in the issue of the MINING AND SCIENTIFIC PRESS of June 12th, that so far subaqueous mining has not been a success in this State. I have read Mr. Richards' letter with great interest and fully endorse his remark that successful dredging must be the result of mechanical skill and "evolution." This evolution is exactly what I claim for the class of dredges that I am now designing, and which are being built by the Risdon Iron Works.

A brief resume of dredging as carried out on the river Molyneux in New Zealand, where there are now working some sixty dredges, will show the evolution process. It is a very swift river, carries more water than the Sacramento, and the bottom is composed of a layer of barren tailings varying from one to twenty feet deep and traveling at varying velocities; then comes the old formation of boulders and gravel interspersed with seams of pay dirt. As there is an immense amount of gold in the bed of the river, it was at once recognized that means must be found to handle it. In the early days the miners worked the banks as far in the river as they could reach with spoon dredges. The next evolution was a small, weak and poorly constructed bucket-ladder dredge driven by current wheels on either side. These proved very inadequate to handle the heavy boulders and were only able to work in the current. The next step was to make the machinery heavier and put on a steam engine. It was about this time that the use of the spud—in New Zealand called a sett—came in, but did not last very long, as it was found inefficient and took more hands to work it. The spud is not found now on any dredge in the country, being quite out of date. In place of the spud the best dredges use a power winch with six drums, all being under the control of one man. Four of these drums carry lines running from the four corners of the dredge, the other end of the line being affixed to "dead men" or backers on the beach. The fifth drum carries the head line. With these five lines the dredge can be made to rapidly take up any position necessary, one man handling her with the greatest ease and nicety and with no loss of time. The sixth winch barrel carries the ladder line, raising or lowering the ladder as necessary. For lifting the large quantities of gravel, rock and boulders, after long and thorough trials, it has been found that the bucket ladder will easily beat the centrifugal pump. The pump dredge was given a very fair test, different makes of pumps being used, but all attempts ended in failure. The failure arose from two causes—first, lack of efficiency. Mr. Richards, who is a leading authority on centrifugal pumps, will bear me out that directly you design a pump to carry large stones you do so at the loss of efficiency. In the second place, unless boulders up to one ton in weight could be handled, a machine was useless in the Molyneux. For sand or slurry the centrifugal pump, I at once admit, is the thing; but not for gold dredging. Two other methods have been tried—one the pneumatic caisson. This would be all right for a rich patch, the locality of which was exactly known; but for regular every-day work, where much barren stuff had to be lifted, it proved a lamentable failure. The last method was the hydraulic elevator—a most excellent appliance in its place, but this place is not in a river bed forty feet below the level of the water, as most of the work of the elevator then consists in pumping water which does not carry gold. The successful gold dredge of the present day is the present dredges are made at least twice as heavy as would be arrived at if calculated to transmit the average horse power used. These sizes have been arrived at by gradually enlarging until a size has been found which will resist the shafts of the

THE PARROT SMELTER.—(See page 213.)

THE COLORADO SMELTER AND CONCENTRATOR.—(See page 213.)

THE BUTTE REDUCTION WORKS.—(See page 213.)

evolution of thirty odd years, each dredge built being an improvement on the predecessor. No man can sit down and design a dredge by calculations, the strains the machine is subject to being so variable and impossible to accurately foretell. The main heavy shocks the dredge is subject to. I am now building a dredge on the Yuba river to dredge forty-five feet deep with a gross capacity of ninety-three cubic yards an hour. The dredge consists of two long pontoons, each 96 feet long by 9 feet beam. These are connected at the stern by a small pontoon 17 feet long and 5 feet wide, the bow being connected by a heavy overhung beam. This practically makes one boat 96 feet long, 23 feet wide with a well hole 5 feet wide, running through the center for some 75 feet.

The ladder 67 feet long, built up as a heavy lattice girder, is hung at the stern end by a bar fixed across a heavy wooden framing. The lower end of the ladder carries a five-sided tumbler and is suspended by blocks and tackle to a cross beam. By means of wire rope and blocks the winch can raise or lower the bottom end as required. The top tumbler is carried by the timber framing some three feet above the top end of the ladder. The continuous bucket chain comes up the top side of the ladder on rollers round the top tumbler and back in a catenary curve to the lower tumbler. The top tumbler is driven through a rope transmission and heavy gears by the engine, a vertical compound condensing one which also drives the pump and indicates about 35 H. P.

The material discharges from the buckets onto a dellvery plate, down which it shoots into a revolving screen or grizzly. The centrifugal pump, throwing 3000 gallons per minute, supplies water to a perforated pipe inside the screen. This water thoroughly washes the material, the finer wash dirt and gold going through holes in the screen and falling into a distributing box. From the distributing box it passes on to a set of gold-saving tables, 11 feet wide, and thence into a flume. In this connection I would like to point out that the experience in New Zealand leads us to get the greatest width of table practicable, thus running the wash dirt over it in a thin or shallow stream, whereas the general practice here seems to be to use a narrow, long flume. A wide table with frequent drops and changes of velocity of the stream, together with fairly frequent washing up, is, I feel satisfied, the secret of saving fine gold when mixed with much black sand. The tables are covered with cocoa matting and expanded metal, a finer gold saver than which was never used. The stones and rocks pass through the screen down a stone shoot, either direct into the river or onto a tailings elevator, when working into a high face of gravel. It is now in place to consider the class of ground that can be worked with a dredge and the cost per yard of handling the same. Broadly speaking, any ground which is not deeper than 60 feet below water level, or more than 20 feet above, and which contains boulders of not more than say one ton weight, can be handled at from 3 to 5 cents per cubic yard. The ground need not be in a river, provided the seepage is sufficient to float the dredge and keep the water clean enough to wash the dirt with. I think I can say with confidence there is no other method by which ground, provided it fills the above conditions, can be handled so cheaply.

I have felt a little diffident as to writing the above, as I fear some of your readers may say: "What right has a man from a little country like New Zealand to come here and tell us that their knowledge is much greater than ours." In very many ways California is well in advance of New Zealand, especially in quartz milling, and I have learnt much since I came here; but in this one particular class of mining, viz., dredging for gold, I do claim, and with justice, that New Zealand has had more experience than all the rest of the world, and if any of your numerous readers will do me the honor of coming to see the dredge on the Yuba when working, they will be ready to admit that it does all I claim for it. There is, I believe, in California an immense area of country which can be profitably worked by the above method, and anything which keeps the miner in California is a general and direct benefit to the State.

The Mesa Scaled.

After four centuries of effort the Mesa Enchantada in New Mexico has been scaled. The honor belongs to Prof. Libbey of Princeton University. The mesa rises to a height of 850 feet sheer from the plains and covers a space of ten acres. For ten years the place has challenged the attention of scientific men, because of the rumor that it was inhabited by the remains of an ancient race, and numerous efforts have been made to reach its summit, to no avail. Prof. Libbey was equipped with a number of tandem kite teams, a balloon and a gun used by the United States life-saving service. It was with this latter apparatus that the ascent was made of the rock which Coronado, as early as two centuries ago, stated was more impregnable than Gibraltar, against which the armies of the world would not avail. The cannon was anchored in the desert and a cord of 3000 feet in length was shot over the mesa and made fast in the sand of the opposite side. Then a workman made the ascent, creeping and climbing over the rough edges and shelves to the summit. He was followed by Prof. Libbey, who went up in a traveling chair. Then came others of the party. On the summit were no evidences of inhabitants. The huts that were there are gone. The bones of the 200 women said to have been left on the surface to starve could not be found. It was a bare and desolate place. The only water found was such as stood in hollow places dug out by the Acoma Indians 1000 years ago. There was no animal life of any kind. There were the great rocky battlements used by the tribe before their rocky ladder path was destroyed and by which they defended themselves from attacks of the invaders, but all else was desolate. It is presumed by scientists that the flora found on the surface would be of the kind that grew in the prehistoric world, the summit having just emerged from the ancient sea, and it is presumed that the flora has not changed. Therefore the specimens gathered will be of vast interest to botanists, and may perhaps open a new field of discovery.

California vs. Klondike.

TO THE EDITOR:—That Klondike is a great country there can be no question; I believe in it. Yet it has its disadvantages. But when we consider other points of lesser or greater advantage, we bring almost a balance.

For vast numbers to rush into a comparatively uninhabited wild in winter, suffering must ensue; but soon order comes out of chaos, and comforts out of wealth, and so will it be in all this northwestern country. The question of cold and snow cuts no figure except to the pioneer for a short period. Let the rush go on. California has more to gain than lose in the long run. While the world is talking of Klondike, California will receive its share of consideration. Klondike has great gold fields; so has California. One serious difference here confronts us: on the Klondike you can wash down the mountains, if needs be, while in California barriers are before the miner, and the treasure he could unfold may lie unearthed, unless some change is inaugurated. And here I will say it is time there was a determined sentiment among the people for appealing strongly to the Government to take some active measures whereby our gravel beds can be worked, that California may hold her place with all other sections of the gold-producing world.

Klondike may send a million of gold to San Francisco (to do so would make a great stir for Klondike), while could we of California now work our gravel beds as of old, a million a month would come to San Francisco. Yet but little consideration is given to this.

As to the question which is the richer of the two, when the Klondike can show a production of $550,000,000 for her first ten years of mining then may she claim to be the peer of California. For the present California is hampered with prohibitory mining laws, and must mainly depend upon her quartz interests; and this interest has drawbacks which should be corrected by better mining laws. And here I refer to the dog-in-the-manger policy of holding claims from year to year and doing no development of value. Some few have been well rewarded, but the vast majority have not. So in California we have three obstacles in the way of building up the proper advance in our gold product, and these are: First, the suppression of hydraulic mining; second, the tardiness in development of the quartz interest; third, the unreasonable prices demanded for undeveloped lodes. The "fever" for the Klondike means work to get there, and work on the ground when there. If our California miners, as a whole, would get the same "fever" for working their own now idle properties, the results might be better.

The owners of the Blue Jay were developing their mine, and they "struck it rich." Work is what tells in mining. The possible yearly outcome for California, with provisions for untrammeled hydraulic mining, and a "fever" for developing our quartz lodes, is $30,000,000 per annum; while as it is, $17,500,000 is doubted.

As is the fall of silver, so is the increased value of gold, and the greater the reason for mining more gold. To increase our volume of production, as matters stand to-day, California must mainly depend on her gold-bearing quartz lodes, and, to depend on them, there must be more general development to maintain our status. A. B. PAUL.

San Francisco, August 20, '97.

On Horseback in California.

Many readers will enjoy the enthusiasm of a writer for *Outlook* who has enjoyed a vacation trip on horseback in California. He writes that of all modes of spending the summer holidays, experience has convinced him that this is the most delightful. He has driven, tramped and ridden over a good part of central California in the summer months, but regards his expeditions on horseback as the most delightful of his life.

The Horse's Back.—But the back of the horse must be a matter of serious consideration on the part of all who would travel thus. To begin with, the right sort of horse must be chosen for such a trip. He should not be too large, nor too heavy. A short-legged, good-barreled animal, short in the back, long underneath, high on the withers, and with good feet, is the ideal for a saddle trip. If he is not high on the withers, the saddle should be padded to supply the deficiency. It cannot be remedied by putting a crupper on the saddle. The pulling of this contrivance on the horse's tail, if the saddle slips forward, is sure to cause the animal pain and make him restive. On such a trip, unless the hair cincha is used (and it is greatly superior to the English girth used in the East), the saddle should be provided with a breastplate, as, even with the best of care, some horses become a good deal "tucked up" before the end of such a trip.

Care of the Horse.—It goes without saying that the saddle should fit well. On a long trip do not be afraid to use good, thick saddle-blankets. Then, have made, and carry with you, half a dozen saddle-cloths of linen. One of these should be put on next the animal's back, and a fresh one used every day. If the saddle is taken off at noon, then a fresh linen must be put on in the afternoon. Enough should be taken along to insure having a clean one each day, and they can be washed at different stopping-places. It is best not to remove the saddle when you halt at noon, but the girths should be loosened. A horse will never have a sore back, unless one is an atrocious rider, if the cowboy method of treatment is followed. When the animal is brought in, loose the girths so that the hand may be passed between them and the horse. Lift the saddle for an instant, but do not disturb the blankets. Let the saddle fall back into place, and allow the horse to stand until his back, under the saddle, has completely dried. This will take from half to three-quarters of an hour. Then take off the saddle and blankets, and ten minutes later take off the linen cloth. Never put cold water on the back of a horse when it is warm from the saddle. Some horsemen do this, but it is a piece of cruel folly. If the animal's back looks puffy, use hot fomentations and then dry thoroughly.

I have made many long trips, taking this sort of care of my horse, and have never had a sore-backed mount. If you expect to go through rough country, do not have your horse clipped about the legs; and in any case the hair under the saddle should not be clipped within at least a month before starting on a holiday trip. The short, clipped hair stands up and feels very unpleasant to the creature when pressed by the saddle.

Silver's Continued Decline.

Regarding the present slump in silver, it would seem as though forces in the world's economy were at work that militate against implicit dependence on past conditions. For a hundred years it had been, till the past six months, noticed that wheat and silver rose and fell together. Now while the metal drops the grain advances in price: from time immemorial China was a purchaser—the Orient an absorbent of silver: now is presented for the first time in human history the spectacle of China being a seller of silver instead of a buyer: just what effect these things will have on the party aspect of political affairs in this country is a question which it is neither the province nor the purpose of this journal to discuss. Existing commercial conditions are inexorable in showing that in the case of silver it is not so much a question of overproduction as want of consumption.

"The case with silver and gold in the last thirty-five years has been that the production of both has increased in volume, and the production in the case of each has been at less expense in hours of man's toil. The ratio of increase has been larger in the case of silver than in that of gold, and the ratio of decrease in the cost of mining silver has been less than in the cost of mining gold. At the same time the demand for gold has not been greatly disturbed, while that for silver is much less than used to be the case. At the beginning of the period under survey all the mints of the world, except that of England, were open to the coinage of silver. Now the mints of nearly all civilized nations are closed to the coinage of this metal except in limited amounts and on Government account. With gold it is different. In spite of the increased output and cheaper cost of production, the demand has greatly increased. All the great commercial nations of the world, both on the part of their Governments and of private persons, have been greatly increasing their holdings of gold. Nations like Austria and Russia, where gold was almost unknown, have been accumulating this metal and are still doing so."

In silver producing camps, as elsewhere, the cost of everything is being materially lessened—mining, milling, smelting, freights, living expenses, machinery, and supplies of all kinds. Looking at the matter in its broadest view, the nation as a whole is better off to-day than one year or two years ago. With very few exceptions the silver producing mines yield lead as well, which sells to-day for better prices than a year ago, with a probability of keeping up to the present figure, and everything will necessarily tend to adjust themselves to existing conditions.

Mining Summary.

CALIFORNIA.

Alpine.

Conner and Bottomfield are working a mine four miles below old Summit City. The ore, they claim, shows a mill test of $55.19 in gold and $1.65 in silver. They have a 4-foot ledge which shows 12 inches of solid ore, and have run a 40-foot tunnel. In tunneling 200 feet farther, they expect to strike slate.

Amador.

The Potazuba Mining Company has finished the 200 feet sinking of the shaft, making a total depth of 450 feet on the incline from the surface in four months. The company will sink another 100 feet before doing any development work.

The Oleta Canal & Power Co. through D. R. Thomas will resume work at the dam on the old Case ranch to hold a mile square of water ranging from a few inches to 10 feet in depth, to supply a system of ditches to furnish power for the mines in the Robinson district, the Iron Mass and the Monte Christo.

At the Gwin mine the old south shaft is opened and retimbered. The plan is to catch the waste water from the mill and hoist in a tank below the works, convey it to a compressor at the Mokelumne river in a pipe then convey the air from the compressor back to the old south shaft and use it to operate the hoist and the pumps.

At the Oneida during July they carried the shaft which is 15 feet 4 inches by 5 feet 6 inches inside the timbers down 68 feet. In thirteen months and thirteen days the shaft has been sent down 872 feet—about 6½ feet per month for the time.

Capt. Thomas Mein, in charge of the work at the Oneida mine, reports the shaft down 1200 feet.

Butte.

The Catskill gravel mine near Bangor has been bonded and is to be worked from a drift tunnel.

Last Saturday an attempt was made to blow up the Miocene flume that brings water to Morris Ravine. The effort to wreck it was made near the Wagner mine. Two or three charges of giant powder were exploded. The effort was a failure so far as destroying the flume was concerned. The Golden Feather, Limited, Company offer a reward of $200 to discover the person who committed the act.

Calaveras.

At the Eclipse gravel mine on Tunnel Ridge Supt. Hall has run a 600-foot drain tunnel. The gold taken out is very coarse and is worth $19 an ounce at the mint. The mine is supplied with a Cox pan, capable of handling 200 tons every twenty-four hours, and is run by water from the Mokelumne canal under 200-foot pressure. There are twenty-five men at work in and around the mine.

At the Eclipse mine, formerly the Anthony, on Tunnel ridge, two miles from Mokelumne Hill, in running a bedrock tunnel a rim channel, 15 feet above the channel proper, was discovered, the gravel of which, according to the *Prospect*, will yield $8 to the carload or $10 to the ton.

The Paragon group of mines are being worked by a tunnel that cuts through them at a depth of from 300 to 500 feet from the surface. The mine has a 5-stamp mill well supplied with water power; the premises are lighted by electricity produced on the ground. The ledges average from 3 to 15 feet in width and the rock yields by milling about $10 to the ton. P. L. Shuman is the manager and one of the principal owners.

The North Star gravel mine, in Happy valley, about a mile from Mokelumne Hill, resumed operations on the first inst. They are taking out good $2 gravel and the 10-stamp mill is kept pounding day and night. Wm. Cook is superintendent.

At the Roanoke, formerly the Moser mine, situated a mile from Mokelumne Hill, operations have been suspended in the Moser shaft and all work centered in the Lamphear shaft, where sinking has of late been carried on. Supt. Harris says stoping in the Lamphear will soon commence, when the mill, which had been shut down while sinking was going on, will be started up again.

The Kentucky mine, owned by the Western Mining Company of San Francisco, is being pushed under the superintendency of J. S. White. A 25 H. P. boiler together with gallows-frame and other necessary equipments have been erected, and sinking to strike the contact vein is in progress.

El Dorado.

Rich strikes are reported at Spanish Dry Diggings, Kelsey, Bear Creek, Long Canyon and other places in the vicinity of Georgetown.

The *Gazette* says most of these are never known to the outside world, the finders either shipping their gold very quietly or selling to local merchants, who are requested not to divulge the name of the finder.

Several thousand dollars are reported to have been taken out at the Hines mine, near Spanish Dry Diggings, seven miles west of Georgetown, during the past ten days. Twenty-five hundred dollars was taken out in one day. This mine is bonded to an English company, with William Moss as superintendent.

The shaft at the Grand Victory mine is to be sunk 100 feet deeper; it is 7x12 feet in the clear on an incline of 70°. Power for hoisting the rock and for pumping water is furnished by the company, also timbers framed and delivered at the top of the shaft, to be put in place by contractor.

Inyo.

At the Sherwin mine, northeast of Bishop, is reported the proposed erection of a new mill and cyanide plant.

Duenweg and Girard at the Builion, running parallel with and east of the New Year mine, one of the Inyo G. M. Co.'s properties, have a ledge between lime and slate, the former being the foot wall and the latter the hanging wall, averaging $10 a ton in gold.

The Last Chance mines, Nos. 1 and 2, twenty-five miles from Keeler, were finally bought this week for $80,000, half cash. The Inyo County Mining & Development Company, W. W. Boswell superintendent, has been working the property since Feb. '97 on silver-lead ore and is reported to have taken out $55,000 in that time.

D. Driscoll of Panamint reports from Pleasant canyon removal of the 20-stamp mill, now four miles from the mines, to the property, and proposed addition of a cyanide process plant. On the property are three tunnels leading to a depth of 300 feet. The ledge averages 15 feet and runs $20.

Ballarat, the town of the valley and the main base of supplies for the section, is building up.

Kern.

At Randsburg the Kinyon mine produced over $9000 in July, with the greater part of the month devoted to dead work.

Miner: At Johannesburg the Val Verde has 200 tons of good milling ore on its dump.

One shaft of the Camperdown is now 90 feet in depth, and they are getting out some good ore.

A strike was made in the King Solomon mine last week at the 190-foot level.

Johnson & Ritchie of Los Angeles propose building reduction works.

The Randsburg Placer Mining Company has been organized with $1,000,000 capital stock, of the par value of $1; three-fourths subscribed by Randsburg men. Directors—J. M. Bracewell Jr., P. Carroll, D. C. Kuffel, S. H. Reynolds, W. H. Hevren. The property is three miles from Randsburg.

A Garlock correspondent of the *Herald* writes: "As an indication of the wave of prosperity, all the mills are running except one small one—and they are running on rich ore. The mines here and at Randsburg are producing $60,000 per month, and there is little doubt that the amount will be increased to $250,000 if the mills are kept busy, which is the indication. Their capacity is about 3000 tons per month, and the ore so far has averaged nearly $100 per ton." Garlock is the milling point for most of the Randsburg mines.

Los Angeles.

The Mohawk-Acton Mining Company is organized in Los Angeles under the laws of Arizona, with 1,000,000 shares, par value $1, non-assessable; B. Katzenstein secretary. The company owns three claims on the extension of the Red Rover ledge at Acton, Los Angeles county. Considerable development work has been done on the Banbury claim, showing a ledge of ore, upon which the company will sink a shaft.

Mariposa.

The *Herald* of Boston, where most of the Merced stock is owned, says: The Merced management at the mine has drawn no money from the East for a couple of months and the property is a little more than paying its way. The company has $20,000 cash in the treasury and Merced people say the stock is worth more than when it sold at $10.

Mono.

Last week the men at the Jordan mines were paid off and work suspended for the present, it being the intention to thoroughly test the ores, to ascertain the best and most economical method to work them.

Nevada.

(Special Correspondence).—At the Orleans (which was idle for many years), now comprising four claims, all of which paid many hundred thousand dollars, and to a depth of only 400 feet, the company is driving the shaft and have reached 800 feet, on which level they are drifting north on the course of the ledge. They are also driving a crosscut on this level, expecting to tap the old Filmore, better known as the Rich Hill ledge. An air compressor and electric motor are in course of construction, which will add another to the electric power company's industries. Supt. Brockington will drive the work ahead very rapidly with his new power. During the past week the indications in the ore were very favorable.

Development work on the Wisconsin has reached 600 feet in the shaft, 300 feet on No. 4, 300 feet on No. 5 and 25 feet on No. 6 drifts. The ledge is of fair size. One hundred and twenty-eight wagonloads of ore crushed at a custom mill yielded $30 per load.

Work has been resumed on the old Kentuck, now known as the Blackrock. Mr. Tuttle, the superintendent, is driving the work with energy and effect.

The Central mine, six miles east of Grass Valley, is erecting a 10-stamp mill.

A visit to the Allison Ranch mine reveals a wonderful piece of work in reopening the old plant. The pumping machinery operated by compressed air is capable of hoisting 1000 gallons per minute. The present work has been much retarded because of the small shaft put down in the long years ago. This is being enlarged, straightened and retimbered the entire distance. The water hoist is just completed. Supt. of Construction W. R. Eckert is still managing the work and everything about the place moves systematically as in a well-regulated military camp.

Marwick & Eddy are running a tunnel on the Black Bear property, six miles northwest of town. They have reached 89 feet crosscutting for the ledge.

In the Pennsylvania they are sinking a winze from the 600 and crosscutting from the 700 levels. Supt. Eddie brought in $6500 a few days ago—a cleanup of less than a month's run from only a 5-stamp mill, and working the mine day shift only.

The Massachusetts Hill shaft is down 1400 feet. Drifting is being done on the 1200, 1300 and 1400 levels.

A few days ago I visited one of the famous producers of the county of which one seldom reads or hears. It has but few people in its ownership, and they work quietly along, take out their regular dividends and the outside world scarcely knows that a property of such proportions is in existence. The property comprises the Old Omaha, the Lone Jack and the Homeward Bound, all now in one, and known as the Omaha Consolidated. The company has just completed new hoisting works on the Homeward Bound, and the shaft is down about 80 feet. This will cut into the drift, leading 2300 feet to the Old Omaha, on which the mill (twenty-eight stamps) is in operation. The double track into the new shaft and a separate compartment for the pump are built to last forever. Two new ore bins of 150 tons, a new iron rail tramway 1200 feet and an additional 800 feet reconstructed make quite a railroad line and stations. Hoisting is done also from the Lone Jack. Water power is used in the old plants, steam in the new, and electricity is expected ere many moons to supplant both of them. There are three shafts in use on the line of the vein. The depth attained is 1700 feet. The drifts run 300 feet to the north of the Old Omaha, 3000 feet to the south. There are 100 men employed. Supt. Mainhart is, and for fifteen years has been, the superintendent of this property. He advocated the reopening of it after it had been abandoned a number of years, and for its later development and management he ever holds a place with his people.

Grass Valley, Cal., Sept. 1st, '97.

G. A. Nihell has erected a new 5-stamp mill for the South Fork mines at Graniteville.

The Bullion Consolidated property has closed down until next spring. The shaft of the mine is down 800 feet.

Rich gravel has been struck in the Cotton Hill mine, near Washington. A 300-foot tunnel reaches the channel, which is 70 feet wide.

Placer.

K. L. Dunn has bonded the property of the Dardanelles Consolidated Gravel Mining Company near Forest Hill.

Plumas.

A telegram from Scotland reports the sale of the Halstead mine, on the east branch of the North Fork, and the same dispatch says the new owners are to put up a 250-stamp mill. Mr. Ertz is reported to have so stated. This is a ledge or series of ledges on the east branch of the North Fork. It has been mentioned and described many times and is considered to be a good property.

The California Investment Co.'s ditch, from Taylor lake to the mine, is twelve miles in length, 2½ feet wide on bottom, 4 feet wide on top.

Ten stamps are added to the Little Jamison mill, which is now running.

National-Bulletin: E. H. Benjamin in Granite Basin has a 5-foot ledge of free-milling ore.

At Granite Basin A. L. Shinn has a ledge 18 inches wide.

San Bernardino.

Near Mojave, the Gypsy has been bought by Colorado men for $10,000. The White Peak has been incorporated and a cyanide plant is projected.

San Diego.

Mesquite, a new mining camp, is springing up. It lies thirty miles northwest of Yuma, six miles from Glamis, on the Southern Pacific railroad. The principal mine of the district is the Bay Horse, which was recently sold by Moreland & Co. to a Los Angeles company for $40,000 and a share of the capital stock of the company, incorporated under the laws of Arizona, with a capital stock of $1,250,000.

At Poway the Bidwell mine has a small smelter, furnished by W. Ober.

The *Sun* reports that the Ranchito mill is turning out $100 worth of gold daily from 30 ore. Capt. Farnsworth is preparing to work the North Star at Banner.

In Laguna district, on the Glen Cliff, the shaft has been put down 82 feet and men are working developing the mine. The ledge is 2 feet 6 inches in width. The ore averages about $20 to the ton. The company proposes to erect a small stamp mill, to be run by water power.

At the Escondido mines of the Du Quesne Company the large main shaft is now down about 120 feet; another week will bring it to the water, when the big pumps will be put at work and sinking continue. In the meantime, the mill and concentrators will be put to work on the tailings of the old mill, which, it is understood, assay about $20 per ton.

San Luis Obispo.

The Oceanic, a quicksilver property near San Luis Obispo, is about to be reopened.

Shasta.

C. H. Behrens has contracted with the Mountain Copper Company to deliver fifty tons of quartz flux daily for the smelter. He has ten teams hauling it.

The Mountain Copper Company shipped twenty-one cars of matte from one furnace last week. The *Miner* says this is the most ever turned out in that time by one smelter since the works have been running. Each car contained thirty tons. The company is putting in a large pump with which water will be pumped back out of Spring creek on to the jackets again. This will give enough water to run two furnaces until the rains commence. Then all three furnaces will be kept in operation. The company is building a trestle below station No. 1 on the railroad 200 feet long. On both sides bunkers for roasting ore will be erected.

Sierra.

Wm. Johns Sr., general manager Sierra Buttes Company, is considering the building of a new mill for the Buttes mine. Some of the machinery will be shipped over from the Uncle Sam mine in Shasta county.

Siskiyou.

The *Journal* says very little can be done in the placer mines in this section until the fall rains give the miners a supply of water. A few of the larger companies which have built ditches and put in pipe to give them a supply of water can keep their mines in operation, but the majority of them have to close down when the streams get as low as they are at present. The Klamath is lower than it has been for years, and many of the smaller mines along that stream which usually kept in operation most of the year have had to suspend. The river mines, most of which are operated by Chinamen, are about all that are in operation now.

Casedy & Martin will soon commence work on their ledge, just east of Yreka. They will have to strike the ledge in another place, as it has run out where they have been working. At the last crushing which they had at McCook's mill, on Humbug, from two and a half tons of ore they realized $95.

The Chinese company which is working the old Garret mine, near Hamburg Bar, have done well this season. They are indefatigable laborers, accomplishing work at a small expense which would cost a white man a large sum. When they took the mine the first work was enough to discourage most any one but a Chinaman, as thousands of tons of debris which had been dumped over the pay channel had to be removed. The Chinamen set about it, soon having it out of the way and taking out pay dirt. The mine is hard to manage, especially at the first of the season when such a large volume of water is running in the Klamath. It is impossible to tell just what this company have taken out this season, as they are very reticent about giving any information.

The old Shore ledge in Quartz valley, in which quite a rich strike was made a few days ago, will probably be sold soon to some parties who were looking at it a short time ago. Major Myers, who owns the ledge, has been in the county the past week and will probably make the sale. This ledge has been counted among the best in that section for a long time, and if taken hold of by a company that will put up a good-sized mill and develop it on an extensive scale, it will without a doubt prove to be a splendid paying property.

The owners of the dredger on the Klamath have always claimed that the dredger paid well; it is a well-known fact that the Klamath is one of the richest streams in California, although great doubts were entertained as to the successful operation of the dredger on the Klamath.

It is reported that a miner named Jim McCartner found a nugget of gold at Soda creek, near Dunsmuir, this county, which weighed $300. It is a beautiful specimen, perfectly smooth and shaped like an egg. The diggings where the nugget was found have been worked for over twenty years past. Soda creek is a small tributary of the upper Sacramento.

It is thought that many prospectors who will visit Coffee creek will find their way over the mountains into the Salmon river country, and we may soon expect to hear of a revival of interest in mining circles on the Salmon river. There is a vast amount of good mining ground in that locality which will, with very little doubt, prove to be one of the richest mining sections in the State in a few years.

News: Judah, Pope and Joost of San Francisco have purchased a large tract of patented placer ground near Callahans and are making preparations to secure the necessary water rights and develop the property.

A wing dam has been put in Scott river at a point where the tailings from the Brunt, Shorb & Co. mine have been accumulating for about twelve years past.

J. F. Garrette has bonded the Mattie placer mine at Hamburgh to L. Ramus, who has fitted up the property and will begin operations at once. There is a dip wheel, pump and derrick on the claim.

A large amount of gold has been taken from the mines on Scott river this season without creating a furore, although it would probably have started a boom if the San Francisco papers had correspondents in that locality. The Pidibibeau claim has been paying well, and several good-sized nuggets have been found lately, one weighing $450. Nesbitt & Hunt have been picking up nuggets from the rock worth from $5 to $100. Russell & Walker have taken out numerous specimens worth $60 and less.

Around Callahans: The Siskiyou hydraulic mine has finished assessment work. With two men working for two months $10,000 was cleaned up.

The Montezuma has completed a cleanup and from the statements of the Chinese manager the amount was about $100,000. This mine is operated by hydraulic and adjoins the Last Chance.

The Tacoma Company, B. S. Grosscup manager, is enlarging ditches from Sugar creek and Wild Cat to operate on land adjoining the Last Chance.

The Jamestown Mining Company of Jamestown, N. Y., are running a tunnel to tap a vein which is supposed to be the feeder of the whole county. The surface indications are very promising. They have been at work for two years and expect to soon realize handsomely.

The Last Chance mine, owned by a Portland company, has suspended operations owing to lack of water. They did not reach bedrock and obtained gratifying results as far as they went. The long ditch under construction will not be completed in time to use this year. They intend to carry a line of pipe across to rim rock and work there the balance of the season.

The Crawley quartz mine, owned and operated by Geo. A. Warder, has resumed operations. This property promises to be one of the best in the county. The vein matter is 150 feet in width and contains small strings and streaks of very rich sulphurets. Taking the vein as a whole, the good with the bad, it will average $4 to $5 per ton. The mine has an excellent location.

The Beaudry Mining Company on Wild Cat have five miles of ditch completed and are at

work upon three miles more. These ditches are 4x3½ and 7 feet on top.

The Salt Lake (Utah) Company, operating on the north fork of Coffee creek, about ten miles from Callahans, are having difficulties owing to complications in the company about railroad lands. They still have a few men doing preliminary work.

Trinity.

The Coffee Creek "boom" is subsiding. J. F. Boyle, from Coffee creek, says that Hickory creek, Hardscrabble, North Fork and Union gulches are overrun with hundreds of men looking for something, and some of them are also looking for the man who started the boom. In conversation with Murphy, of the Burgess & Murphy mine, whom the San Francisco papers reported had taken out $80,000, he said they had taken out just $300. When asked how the reports of such a big strike got out, he said the reporter came to the mine and they had just taken out $80. When the reporter got to Nash's it had increased to $800, and when he reached Carrville it was $8000, and when the story reached Redding it was $80,000. At the mouth of Hickory creek and in a few other places stringers have been found which paid well, and some good pockets have also been taken out on Coffee creek, but this is occurring every day with little notice being taken of it.

At New River, P. Larcine has found a cinnabar ledge and is developing it. The *Journal* says it compares favorably with the ore of the Altoona Company's mine.

At the Black Oak mine the *Democrat* says the principal portion of ore reduced at present comes from between the 8 and 10. The average twenty-five tons of ore reduced daily at the mine's mill keeps up, as does also the 200 tons of rich material shipped monthly for treatment to the Selbys. The new 7-drill compressor has started up. It is reported that one machine in the Black Oak, worked two shifts, showed $120,000 for six months' work. The property is being operated full-handed by Superintendent Scott.

Journal: At Know Nothing creek the Gold Run Company have finished a 1100-foot tunnel and a 400-foot upraise for air and are stoping. They have 500 feet of stope. There is a 10-stamp mill, with electric plant. A. Dannenbrink is superintendent.

Tuolumne.

At Cherokee the *Banner* reports the Carlotta, Pennsylvania and Little Carlotta started up, and all necessary machinery and improvements to operate the Carlotta have been placed. A shaft will be sunk 100 feet and tunneling will follow.

Ventura.

The Bunker Hill is to have a 20-stamp mill. New York men are developing the property.

NEVADA.

In the Big Injun mine, near Corville, Esmeralda county, twelve miles from Hawthorne, the ledge that has been found is said to be the biggest thing in the country, with the exception of the Silver Peak mine.

The leaching plant erected in Six Mile canyon by Blood and Harris will be in operation Nov. 15th, and consists of twelve leaching vats, 24 feet in diameter and 5 feet high, two sump tanks 24 feet in diameter 8 feet high; two supply tanks 16 feet in diameter 12 feet high. In all other respects the plant will be similar to the one at Bodie and will be operated by water power, the supply being obtained from the canyon; a ditch 3330 feet long and a pipe line of about 900 feet being necessary to convey the water to the Pelton wheel which will run what machinery there is in the plant. The plant is being erected to work the Park tailings, of which there are about 130,000 tons, at the rate of 200 tons per day.

The concentrator at El Dorado canyon is in charge of E. W. Kay.

The Austin Mining Co. and the Reveille keep the old town of Austin, Lander Co., alive and going. The uniform wages are $2.50 a shift each in the mines, the tunnel and the mill; $20,000 are distributed every month.

The Union mine at present is the principal one, worked by fifty men under T. O'Connell, by the Clifton tunnel, 7,000 feet in length, with over 2,000 feet of crosscuts. Water in Lander hill was tapped about 600 feet below the surface. A bunch of mines, chief of which is the Frost shaft, filled with water to a depth of 400 feet, were drained and rendered fit to be operated after ten years. The tunnel is lighted by 220 incandescents 100 feet apart. The mill, daily capacity eighty tons, is near the entrance.

At Bald mountain, White Pine county, Eastern men have located and patented all the desirable mining land in the vicinity. With the exception of one or two claims, they have a corner on the mineral land. Engineers have been surveying for the company for four months. The company has purchased the Hot Springs ranch for $5000 to secure water for its mills. Bald mountain is sixty miles south of Elko, in the Ruby range.

OREGON.

The men who bought the Horn Silsby-Tucker mine, Jackson county, have organized a joint stock company with Capt. A. M. Brown as superintendent. The mine hereafter will be known as the Oak Flat mine.

G. W. Treffen, superintendent Rogue River mine, on Rogue river, reports running fifteen men and cleaning up from $5 to $12 per day per man

Sharp, Morrison and Hosley made a cleanup at their Powell creek, Josephine Co., mine after a run of fifty-four days, giving $2000.

There are several wing dams in Rogue river between Tolo and Grant's Pass, and many of them are worked to good advantage.

P. H. Oviatt of the Evans Creek Mining Company has a load of coal in Grant's Pass from their mine, tested by the water works engine with satisfactory results.

The Jackson Mountain Mining Company has incorporated in Jackson county; capital, $750,000; office, Portland: D. M. Watson, C. L. Carr, A. J. Farmer. The company is developing a quartz mine a few miles west of Jacksonville.

Brobst Bros. of Denver and Dekum Bros. of Portland have a group of claims on Elk creek under the title of the Apollo Mining & Milling Company, and are working a night and day shift of fourteen men running two tunnels on their property. James L. Brobst is superintendent.

The Ox Heart and the K. S., adjoining the Oro Fino mine, Josephine Co., have been sold to Spokane parties.

The first money on the Horn, Silsby-Tucker placer mine is paid. Baltimore men take the property; price, $20,000.

J. H. Weston of the Summit mine, on the Oregon and California line, reports the crosscut tunnel progressing. He has cut a 30-foot vein of low-grade sulphuret ore.

J. W. and M. A. Robinson of Wimer have a placer mine, Josephine county, on Brass Nail gulch, a tributary of Jump-off Joe creek, a few hundred feet below the Hamersly quartz mine: $1892.26 was the cleanup for ninety days' run with two men.

BAKER COUNTY.

T. Morcom, manager of the Sanger mine, took charge two months ago and has it unwatered.

The Polar Star, near the Bonanza mine, is sold to A. H. Mallory of Spokane.

BRITISH COLUMBIA.

(Special Correspondence). — Klondike will claim very few Vancouver victims. Not a dozen citizens have left for the far-away diggings, owing to the entire city being more or less interested in British Columbia mining, and all expecting big returns from their numerous ventures.

There is little to state that is new. All the camps within a radius of 200 or 300 miles from the seaboard cities are doing development work, assessment work, mining and proving up prospects, and wholesalers who are supplying these camps say that trade was never so good in British Columbia as now, while Victoria business houses have been kept very busy outfitting passengers for Klondike.

Philips Arm, a district a comparatively few miles north of Vancouver, has attracted the attention of several American capitalists of late, who have purchased several claims with a view of development.

The Lillooet and Fraser river hydraulic claims, owned principally by W. Dietjen of New Westminster, have been sold, through a former San Francisco citizen, Mr. Luckenbach, to Ottawa capitalists for $75,000 cash. This is a well known claim on the Lillooet, near the Fraser river, held last year at $110,000. The gravel is said to be very rich.

At Fairview Camp, Okanogan district, the Smuggler crusher has been running night and day with good results. The 20-stamp mill of the Tin Horn will commence to reduce the company's big dump on Sept. 1st.

Vancouver, Aug. 24, '97. GOODMAN.

The Slocan & Liberty Hill Company, in Slocan district, have let a contract for 2000 feet of tunnel work.

The Pilot Bay smelter will start about Oct. 1st, there being more repairing and renovating to be done than was at first estimated. J. N. Walker, who is to be superintendent and metallurgist of the smelter, has arrived from Everett, Wash. The Blue Bell mine will not be worked at first, the smelter having enough contracts to keep it busy on Slocan, Ainsworth and Rossland ores.

The building of a new lead stack at the Nelson smelter and the proposed addition of one at Trail makes it appear as though the silver-lead ores would not have to go out of British Columbia for treatment to the extent that they have formerly done.

At Horsefly, Cariboo, the Horsefly Mining Company's hydraulic elevators are working. No washup has been made and no general one will be until the close of the season. A few thousand have been taken out of sluice boxes, but the main flume will not be disturbed until the close of the season, when an output of $60,000 may be looked for. The working expenses are about $40 per day.

The cement mill returns are satisfactory. The cement yields from $4 to $6 per ton.

R. H. Campbell is down about 250 feet. He has coarse wash carrying some gold.

The ore shipped from North Kootenay via Revelstoke for the fiscal year ending July 1, '97, was valued at $823,387.

The Poorman mine at Rossland will shortly resume operations.

The Slocan ore shipments via the K. & S. railway for July, '97, are as follows:

Payne	2,568,000
Ruth	2,160,000
Slocan Star	360,000
Washington	221,000
Whitewater	210,000
Noble Five	129,095
Great Western	91,000
Ibex	90,000
Surprise	34,000
Slocan Boy	30,000
Wonderful	28,000
Coin	24,060
Ruby Silver	16,000
Total	5,964,095

Applications have been received at Ottawa from persons who desire to lease stretches of the Saskatchewan river and dredge for gold among the sand at the bottom. The Department has decided to grant the leases under stringent conditions, one of which is that a royalty on all gold brought up shall be paid to the Government. After advertising Stewart river, in the Yukon country, as open to tender for dredging for gold, and receiving several offers, the Department decided that it would not be right to hand over the gold in that river except with a proviso that a royalty should be paid to the Government, and no contract was awarded. The gold in the Saskatchewan being very fine and difficult to obtain by washing, and therefore not so much sought after by gold-hunters, it is considered wise to lease five-mile stretches to parties who wish to dredge.

The Dominion Development Company has sold 100,000 shares in the Golden Cache mine on Cayoosh creek, Lillooet district, for $180,000 to M. Oldroyd.

A telegram from the superintendent of the Cariboo Hydraulic Mining Company states that the result of the cleanup which was completed on the 26th ult. is that the amalgam amounts to 5685 ounces, of the estimated value of $60,500—the product of forty-seven days' washing with two giants.

ALASKA.

(Special Correspondence). — Upon the arrival of the Alaska Commercial Company's steamer Excelsior on the 11th we found the Portland from Seattle (the Alaska Transportation Company's steamer) in port with her full complement of gold seekers awaiting the departure of their new river boat, the Hamilton.

The passengers on our boat have been somewhat disappointed and annoyed at the delay that we will be subject to, as the steamer that will take us up the river will not be here before the 20th and cannot depart before the 25th.

In regard to the news from the mines, it is very limited and not of a particularly encouraging nature. In fact, there was more news in San Francisco than here. There have been a few new strikes made since the last news went out to the world from here, and more may have been made since the last reports from the river.

Stampedes of from twenty-five to fifty men have occurred on Dominion creek, Henderson creek and Minuck creek, the latter being about 400 miles below Circle City.

The amount of work on these claims has been insufficient to determine their values, and no doubt it will be some time before the work can be done, owing to the scarcity of labor away from Dawson City, which at present is the headquarters for all mining news.

The question of food supply is a very serious matter at present, and unless the companies interested are able to get more steamers up the river than usual starvation is a certainty, for a very large number of the people have started for the gold fields entirely unprepared to withstand the hardships or to purchase supplies.

There are quite a number of miners camped at Fort Get There, the North American Transportation Company's station here, a number of whom I have talked to, and it is the same old story of the fabulous richness of the Klondike mines and the hardships to be endured and the probability of extreme want and privation.

The fifteen or more miners here at present from up the river have brought down with them not over $150,000, which has been obtained mostly from the sale of claims on the Klondike, and the result, on the whole, is disappointing to those going up.

The price of furs in this northern country, owing to the enormous rush, has advanced to an almost prohibitive figure; and the furs are not of a particularly fine quality.

When I get nearer the gold fields I shall send you a letter concerning the mining news from a mining standpoint, which will be of interest to your readers; so I will leave the padding of news items to the newspaper correspondents, with whom we are plentifully supplied.

St. Michaels, Alaska, Aug. 15th, '97.

A letter from C. G. Yale, dated at St. Michaels, August 25th, states that he and the rest of those who left here on the Excelsior July 28th, were to start up the Yukon the following day. He adds: "All the miners who are waiting here on their way down corroborate the richness of the diggings, but say they are limited yet to the Klondike section, but that others are bound to be discovered as soon as winter permits any prospecting. The ground is too wet now. Prices are enormous here for everything; money is of no use at all as representing grub. They predict a scarcity of food of certain kinds up the river, but supplies are being rushed up. We take 1200 tons up on the new steamer Hamilton. Wonderful to relate, they leave barrels of whisky worth $25 per gallon, to make room for flour, beans and bacon. We paid $30 for a Russian bath yesterday for five of us—that is, $6 each, and $1.35 for a towel. Furs are higher here than in San Francisco. The flush miners pay $5 for a 25-cent article, and everything has gone up sky-high. Tell nobody to come up before spring. They all say that it is best by all odds. It will be rough here this winter. There are altogether too many men for the work and supplies, if reports be true."

IDAHO.

At Florence the recent purchase of the Blossom mine by N. D. Moore of Spokane has given the camp a "boom." The price was $10,000 cash.

At the Tiptop mine on the Hailey gold belt, recently purchased by J. Q. Packard of Salt Lake City, work is being pushed; a reduction plan is promised for next spring. There are two ore chutes, one about 300 feet the other 100 feet in length. The mine is being developed by an inclined shaft from the surface and by two tunnels. The Tiptop was discovered in the '70s; but very little work was done upon it until about three months ago.

Hailey *Times*: The company that is to recover the values in the old tailings of the Camas No. 2 is known as the Idaho Recovery Company. It is an offshoot from the American Cyanide Company, whose process it will use, with such modifications as the constituents of the tailings deposit will require. The Recovery Company, it is generally believed, is to pay $40,000 for the tailings. It will cost $1.25 per ton to work them. That will be about $40,000 on the 30,000 tons at the old millsite. If they extract $5 per ton, they will net $70,000 on the operation.

Near Elk City, the American Hill Mining & Development Company, which took out $123,000 last season, have a large force following the old river channel. A hydraulic plant is being used.

UTAH.

The producer of a certain class of ore that is marketed in Salt Lake City, says the *Tribune*, each day is getting a better margin than the miner who was putting out a similar class over twenty years ago. Twenty-one years ago he was receiving $1 an ounce for his silver; yesterday the market price of the same metal was 52 cents.

That this is true is disclosed in a little book that has been preserved by Jos. Galigher since September 19, 1874. On that date he was marketing ore from the Spanish mine at Bingham. The metallic contents of the ore consisted of lead, silver and gold, with a very small amount of the latter. The miner at that early day was anathematizing conditions that rendered his margins very narrow, and with silver at 52 cents, the same man was profaning them yesterday. It was while a group of them were expressing their grievances that they were invited to go back into the past and measure the hardships with which the miner of '76 had to contend as compared with those that are reducing his profits to-day. Upon the leaf at which Mr. Galigher's record was opened was engrossed the story of a shipment of ore made in August, 1876, from the Spanish mine, of which W. G. Galigher was the manager. The returns from the sampler showed that the ore contained 45 per cent lead, 10.20 ounces silver and gold of the value of $2.99 per ton. The settlement discloses that the seller received $15.20 per ton, whereas had the same lot been marketed yesterday, he would have received $21.80 per ton for the same lot. On his lead the shipper of '76 was allowed $1 per unit for all in excess of 40 per cent lead, the 40 per cent being exacted by the smelter. From his lead he accordingly derived $5. For his silver he received $1 per ounce, which on the shipment would have earned him $10.20, while nothing was allowed him for the particle of gold contained in the lot. In fact, he was allowed nothing for his gold unless it reached $3.

The copy of another shipment was found further on in the same book, where a lot of ore was marketed that showed 40 per cent lead, 22.74 ounces silver and gold of the value of $6.01 per ton. This consignment was from the Storey mine at Bingham. The smelter for reducing it to bullion exacted 35 per cent of the lead, and settled with the shipper at 50 cents a unit for all in excess of that amount, which allowed him $2.50 out of his lead. For his silver he received $1 an ounce, or $22.74, and for his gold $3, making a total of $28.25 per not. But at that time the producer did not have the facilities for extracting his ores and marketing them that are afforded at the present time. The book discloses that in the marketing of the lot of ore on September 8, 1876, from the Storey mine, the consignor was compelled to shell out $3.75 per ton for transportation from Bingham, whereas at this time the rate is $1.25. The same settlement shows that the shipper paid $3.75 for the sampling of his ore, whereas to-day he is required to pay about 60 cents per ton save where the output is under contract, when he pays but 50 cents. In addition to this the producer was made to pay $4 for an assay that may be obtained to-day for $1.50. In the shipment from the Spanish mine, where the presence of gold of the value of $2.99 is certified to, and which was ignored in the settlement, he would have yesterday been allowed $1.85, according to a local smelter, and with this added to the settlement, the man who sold his ore in 1876 would have received $9.70 per ton more had he marketed it yesterday.

These examples are given that the miner of the present may grasp an idea of the hardships with which the miner of the past had to contend. As the time has sped on the methods of smelting have been simplified and improved, the price of the supplies has been reduced, the railroads are operating at less expense, and a variety of changes has wrought a revolution in the production and the marketing of ore.

It is the silver miner who has neither lead, copper nor gold upon which to rely at this time whose wounds are bleeding him to death. Where the same properties in the ore described in the settlements contained in Mr. Galigher's record exist to-day, the producer is realizing more from his product than he was twenty years ago or a year ago.

Tribune: The Mercur mine has made another shipment of seven flasks of quicksilver.

At present Superintendent Bamberger is securing about two flasks of "quick" per month, derived from the cyanides during the process of drying them in an ordinary retort. The mercury contained in the cyanides passes off in fumes that are conducted through a pipe that is connected with the bottom of a small tank which is filled with water. In the contact between the two elements the fumes are "solidified" and the mercury is deposited on the bottom, from which at regular intervals it is drawn and placed in the flasks. From a piece of ore taken out of the Mercur there is derived quicksilver, gold and the barest percentage of silver.

Were it not for the gold contained in the ores of the Centennial Eureka, it is not unlikely that the management would join the movement looking to the closing down of certain mines in Tintic district. Where the ruinous decline in silver is offset by the advance in lead in some properties, the effect is overcome by the presence of gold in the Centennial Eureka.

MONTANA.

Around Philipsburg: The Bi-Metallic Mining Company shipped to one of their properties in Pocahantas, Mariposa county, California, a small sinking pump.

The owners of the Red Lion property are overhauling the 10-stamp mill preparatory to starting crushing ore.

Butte parties are considering the advisabil-

Mechanical Progress.

By-products in Coke Making.

The chief of the by-products utilized by the by-product oven systems is ammonia. Hitherto the sole source of supply of ammonia in the United States was in the illuminating gas plants, but the use of electricity and of water gas has decreased the production of the article, while the demand for it has been on the increase. Ammonia has many uses. It is an essential material in ice manufacturing, in electrical batteries, in chemical manufactures, and in the manufacture of fertilizers it is substituted for nitrate of soda. The yield of ammonia from regular coking coal is about twenty pounds per ton of coke produced, and at the minimum value of $20 per ton this product alone would be worth 20 cents for each ton of coke.

Two kinds of gas are obtained from coal by means of the retort coke oven system. These are illuminating gas and manufacturing or fuel gas. The latter makes a very good substitute for natural gas. The production of illuminating gas in the retort oven involves a change in the operation of the oven, so that ordinarily produced gas, with the recuperation of both gas and air, may be burned in the flues instead of the rich coke oven gas. It has been estimated that for each ton of coke produced upward of 8000 cubic feet of gas are given off, and the entire product yielded annually in the United States by the coking of coal, allowing one-half to be consumed in the coking process, is upward of 60,000,000,000 cubic feet, or but little less than one-fourth of the annual natural gas production during the height of that excitement.

By-product oven tar is superior to the tar which comes from the gas works. It contains less pitch. The yield for each ton of coke varies from forty to one hundred pounds, according to the amount of volatile matter contained in the coal. It has a fuel value equivalent to $5 per ton, or that obtained by coking a ton of coal is worth from 10 to 25 cents. As a roofing and paving material this tar has a value of about $8 per ton.

As a material for the manufacture of fuel briquettes, coke oven tar stands pre-eminent. In addition to the above uses, this tar, after passing through the complex processes of modern chemistry, comes to us in the form of aniline dyes, saccharine, benzol and other products.—William G. Irwin in Cassier's Magazine.

Mounting Machinery on Springs.

"Should machinery be mounted on springs?" is a question of present discussion. Those who argue in favor of mounting an engine or dynamo on springs say "if gear wants to wobble let it wobble."

If one considers say a direct-acting pump in space, it is a system that of course cannot move its center of gravity as a whole. If, then, its pistons and plunger move in one direction, the rest must move in another direction, the distance depending on their masses. Any imperfectly balanced machinery must, therefore, move its bed plate if freely suspended. A perfectly balanced engine is thus an engine whose center of gravity never varies relatively to its bed plate. This definition is really too small, because a moving system, such, for instance, as two cranks at 120° on opposite ends of a shaft, do not change their center of gravity, but give the bed plate a rocking but non-transitional movement. A gas engine with a flywheel similarly tends to rotate its bed plate at each impulse around an axis parallel to that of the shaft. A balanced engine is, therefore, really one which does not move its bed plate if freely suspended. Such an engine is practically never realized.

When an engineer sees an engine bed plate moving, his first instinct is to bolt it down; it then moves a little less, but still moves, and he has a sort of feeling that it must shake itself to pieces if allowed to move. Bolting down an engine to a bed of concrete is merely increasing the size of its effective bed plate, but the whole bed plate, including the concrete, must now be moved. It rests on the earth, moves slightly, and communicates vibration to neighbors who are longing to be compensated for disturbance. Sometimes the concrete bed plate is isolated by mounting it on felt. That means that the larger bed plate is mounted on imperfect springs.

"The question is, if the bed plate of an engine wants to move, why should it not have free play? As far as the engine goes, a little thought will show that all its parts are subjected to smaller stresses if the bed plate is free to move. An engine will, therefore, wear longer if it is allowed to move its bed plate."

Knocking in Engines in Steam Spaces.

When an engine knocks heavily at starting at each end of its piston stroke, even a tyro knows that there is water in the cylinder, and that he has probably forgotten to open the drain cocks. The warning given by the engine is clear and emphatic, and must be attended to instantly. But sometimes the message is conveyed in another way: There is a muffled blow of the piston and a sharp crack is heard with each stroke. This does not come from the piston, but from the slide valve. This message also tells of water, but from the dull sound of the piston knock we learn that an early compression, by cushioning the steam, drives out the imprisoned water before the piston can strike it with a hammer action. We also know that, as the exhaust port of the valve is shut, something must give way to allow of the escape of the water. The line of least resistance to this escape is at the valve, which is driven back from its face. It is true that the steam in the valve chest is pressing the valve down, but the pressure below it being greater for the moment, the valve rises slightly to allow a thin sheet of water to rush across the port bridge to the exhaust. Then, with the normal motion of the valve moved by the valve rod, a free course is given through the ports; the steam pressure reasserts itself, and with a sharp sound the valve is clapped down upon its face again.

But here, again, we may have variations in the message. The knock of the valve may be of less loudness than is usual when water is imprisoned, and at the same time there might be a total absence of a cylinder knock. Also, the engine may have been running for some time, while the valve click still continues. The engineer has drained the cylinder well, and the cylinder walls are thoroughly heated. The indicator diagram is examined. Then, if the steam compression line shoots higher than the steam line, the clicking of the valve tells that too much compression is being caused by a faulty proportion or setting of the valve.

If the valve has been recently set, and the knock is a new one to the engine, then the valve setting alone is wrong. In this case the knock will be at one end only of the valve stroke, and the excessive compression will be seen only at one end of the double diagram. Thus, by reflection, the engineer can interpret accurately the meaning of the message imparted to him by the engine.

But there is yet another case where the valve is knocked off its face. The valve has been set correctly, and the engine has been at work for some time before the clicking sound is heard. In this case, also, the diagram shows a compression higher than the steam pressure from the boiler, and also only at one end. Other peculiarities of the diagram will also be seen. The compression as it begins on the exhaust line will be right at the end, but be too late at the other end. In fact, on the return stroke everything will be late. Originally the diagram was good, but now the valve has got out of setting at one end, while it is right at the other. For this there is only one explanation, which is that the valve has got partly adrift on its rod. The cotter pin at one end has dropped out and the nuts have slackened back at the end, while the nuts at the other end have retained their position.

Though in this, as in some other cases, the knocking in steam spaces may not by itself tell us everything, yet by comparing the written with the spoken message of the engine we soon arrive at a right conclusion as to what the engine is complaining about. But in all ordinary cases it is not always realized, except by those "in the know," how valuable a guide to defects is given by the varying sounds of an engine, not only in the steam spaces, but in every other part of the mechanism.

THE steel for locomotive boilers is supplied by contract in the shape of flat, rectangular sheets. Before it is accepted the tensile and breaking strength of each one is tested. Next it is marked off by measure with chalk lines for rivet holes, which are punched through it by a machine that does the work as quickly and easily as if it were a slice of cheese. Then the sheet is trimmed to the proper size by a great steel knife, which cuts off the edges like paper. Finally it is turned into a curved shape by passing between huge rollers, and is riveted to other sheets, which make up the cylindrical tube of the boiler, by means of redhot iron bolts. A boilermaking shop is notoriously the noisiest place on earth, but it is surprising to find how soon one gets used to the clamor, so that it would be possible to lie down and sleep amid it all. There is nothing like getting used to things. Every now and then a man is killed in the works by having a boiler roll upon him. He has had such long practice in eluding dangers of the sort that he becomes too indifferent, stepping out of the way a moment too late.

THE master mechanic of the Santa Fe road is quoted as saying that by the use in the Santa Fe shops of a stationary compressed air riveting machine three men are enabled to drive 2000 rivets per day of ten hours at a cost of $4.75, as compared with 200 rivets per day at a cost of $7 by hand labor; the truck riveters—the machine being operated by two laborers at a total cost of $3 per day—drive 3000 rivets, as compared with 175 rivets driven by hand labor by three men in a day at a cost of $6, while the staybolt breaker makes an average saving of $8 per day and the tank riveter an average daily saving of $10. Further, the mud-ring riveters will drive as many rivets as can be handed to them, and will make a saving of $12 to $15 a day for that class of work. This method is declared to insure every rivet hole being filled entirely and insures tight work, while of hand-driven rivets in mud-rings a large percentage invariably leak.

IN sextant observations on shipboard it is often difficult to make measurements from the horizon, and various unsatisfactory attempts have been made to substitute some mechanical or other means of determining the horizontal or vertical. A novel plan—claimed to have been put to practical use on land and sea—has been suggested in France by Rear Admiral Fleurais. It consists in adding to the ordinary sextant a horizontal gyroscope, which is placed in front of the telescope and behind the small mirror, and contains in its upper part two small plano-convex lenses, placed at a distance apart equal to their focal length. On the plane faces of the lenses are engraved two lines parallel to the equator from the gyroscope. The gyroscope is rotated 80 to 100 turns a second, and the horizontal is obtained by observing the position of the figures described by these lines as the lenses revolve.

In New York City, recently, the first official trip of the compressed air motor, designed by Robert Hardy, was made on the Sixth Avenue division of the Manhattan Elevated Railway. General Manager Franzioli and a number of engineers were on board the train, which made the run from Rector to Fifty-eighth street, over five miles, in eighteen minutes. On the return trip stops were made at each of the stations, and the regular schedule of twenty-seven minutes for the round trip was maintained. The trial was a successful one; the motor carried a charge of compressed air of 2500 pounds to the square inch.

Scientific Progress.

Innovations in Stamp Practice.

Recent articles on the above subject have aroused so much interest and inquiry that further information on this subject from D. B. Morison, who proposes to lift the stamps by levers, instead of cams, is of present value.

Continuing his remarks, as quoted on page 168, No. 8 of this volume, he says:

The practical deductions which can be made from these experiments are that a cam stamp having a 7-inch drop cannot be driven at more than 94 to 98 drops per minute in ordinary everyday work, and that the falling weight loses in wet crushing at least 17 per cent of its possible efficiency, due to retardation through friction, and under the average condition of work this will probably be increased to from 20 to 25 per cent. * * * In attempting to improve the cam battery, it should be borne in mind that it represents the combined efforts of mining engineers during the last fifty years, and a vast amount of care and ingenuity have been expended on its available perfection, so that when the writer commenced on the problem he adopted the principle of "leaving well alone," by retaining every detail of the modern gravity battery in its present form, with the exception of the cam and tappet.

The improvements desired were:

1. Increased mechanical efficiency.
   Decreased vibration;
   Less friction;
   Less fuel per ton of quartz crushed.
2. Increased drops per minute.
   Decreased weight of mill per ton crushed;
   Less floor area;
   Less cost of transport.
3. Greater output per stamp head.
   Decreased labor per ton of output.
4. Ability to convert existing machines.
   Increased output from existing mines;
   Decreased cost of production.
5. Simplicity of mechanism.

The high-speed gravitation stamp mill is constructed as follows:

On the top of a frame is a crank shaft with five cranks at equal angles, each of which is provided with a connecting rod jointed to a cylinder in such a way that, as the crank revolves, the cylinder moves up and down. Within the cylinder is a deep plug or piston, the rod of which passes through the cylinder bottom, and constitutes the stem to which the stamp head is attached. A jacket surrounds the cylinder, and at a distance from the bottom is an aperture or port communicating with the jacket space; another port at the top of the cylinder also makes the cylinder and jacket common to one another. The cylinder below the lower port is filled with liquid, the jacket also contains liquid, and above the liquid is air space—both in the cylinder and in the jacket. When the bottom of the piston closes the lower port and the cylinder moves upwards, the piston and stamp head are supported by a body of liquid. If none of this escapes, and the down strokes of the cylinder do not exceed the number which the stamp head could make under the action of gravity, minus the retardation through friction, and if the length of stroke of stamp head is the same as that of the cylinder, the position of the piston within the cylinder remains constant, and the liquid is practically undisturbed. If, however, the stroke of the stamp head is less than that of the cylinder,

and the speed of rotation is, as before, within practical gravity limits, it follows, when the shoe strikes the die, and the cylinder has completed its stroke, that the position of the bottom of the piston is above the cut-off point by an amount equal to the difference of stroke between the stamp head and the cylinder, this space being filled with liquid, which has been drawn in from the jacket. On the upstroke of the cylinder this liquid is forced into the receiver until the cut-off position is reached, when the piston is again raised on a liquid medium as before. It is evident that if the point of pick-up occurs before mid-stroke, that the stamp head will acquire the same upward velocity as the cylinder; the latter comes to rest, however, by the action of the crank, whilst the former is governed by the retarding influences of gravity and friction, so that at the ordinary working speeds the piston will continue its upward motion after the upstroke of the cylinder by an amount dependent on the velocity acquired at about mid-stroke. At certain velocities of rotation, when the stamp head commences to fall, the cylinder will have completed a portion of its down stroke, and if the velocity of fall of the cylinder is not less than that due to gravity, minus friction, the velocity of fall of the stamp head will be increased by the assisting effect of the friction between the surfaces of the cylinder and piston, and also between the rod and the packing, with the result that a very much greater number of drops can be obtained than is possible with the cam arrangement.

The liquid used is water, with a sufficient addition of soap for the purpose of lubrication and to prevent corrosion, and the quantity of liquid is maintained by the continuous flow from a small supply pump from a fixed tank—inflow and outflow being by means of small tubes, one small pump being sufficient for any number of stamps. The upper part of the cylinder above the top port is grooved longitudinally, so that, if a stamp head is hung up, the air passes from one side of the piston to the other without resistance.

In order to provide for the wearing of the shoe, and the consequent lowering of the piston within the cylinder, several cut-off holes are provided at about 1½-inch pitch, so that on the shoe and die wearing to that extent, all that is necessary is to unscrew the next lower plug—thus establishing a new cut-off port 1½ inches lower than the previous one. It has been found that the piston, floating as it does on a quantity of liquid, renders the stem so susceptible to rotation that the shoe rarely strikes the die without certain rotary movement resulting, and it is probable that this will be found sufficient in practice to ensure the even wearing of the surface of the shoe and die; but, if desired, a very simple system of turning gear can be fitted, which works very effectively. No trouble is experienced through leakage at the gland, as midway in the stuffing box is a lantern bush connected to the jacket, so that the packing below this bush is only subjected to the head of liquid in the jacket, or under one pound per square inch. Special attention has also been given to the danger of any lubricant falling into the mortar—the lower supporting frame being constructed of trough form, with an inclined base, so that all waste lubricant is caught and retained.

Exploring South Polar Regions.

The course of at least one expedition will be directed to the south polar regions during the present summer. The expedition of Lieut. Gerlache, which was to have sailed from Antwerp last year, but which for various reasons — especially financial — was obliged to postpone its departure for a time, sailed from European waters on Monday, the full guarantee fund of 250,000 francs having apparently been raised, largely, it is said, through the agency of influential women who took an interest in the enterprise. The destination of Lieut. Gerlache is the region about Graham Land, or more properly Graham archipelago, that part of the Antarctic world which lies almost due south of the apex of the South American continent. It is this tract which is now generally assumed to have been at one time, a time not very remote in geological history, united with the northern land, the fragments of disruption between the two being still seen in the island groups—Falkland islands, South Shetland islands, South Georgia, etc.—which lie in the twist of the broken Andean system. The Norwegian Larsen visited the region in the latter part of 1893, and succeeded in penetrating beyond the 68th parallel of south latitude. To him is due the discovery of the first traces of organic life contained in any rock mass appertaining to Antarctica, a discovery which has thrown new and unexpected light upon the physical conditions which are bound in with the southern pole of our planet. The fossils are of most interest in their botanical relations, for in the discovery of the remains of a forest of the Chilean pine or araucaria we have a most marked contrast presented to the utter barrenness which is exhibited by the floral display of to-day, not a trace of vegetation higher in organization than a lichen having up to the present moment been detected in the entire Antarctic world. This climatic contrast between the past and the present sees itself repeated in the antipodal north, where the stone remains of Atane, Atanekerdluk, and Patoot, in Western Greenland, read the history of giant forests and foresters in place of the lowly vegetation of 6 or 8 inches of today. To Capt. Larsen is also due the discovery of volcanic activity in this part of the Antartic world, Lindenberg and Christensen islands being in a condition of eruption at the time of his visit. A half century earlier Ross had found Mt. Erebus, on Victoria Land, south of Australia, in a similar condition of activity, the fiery volcano rising to the stupendous elevation of 12,000 feet, presenting one of the most sublime spectacles that it has been the good fortune of man to gaze upon.

What may be the extent of Mr. Gerlache's discoveries it is naturally impossible to foretell, but certain it is that opportunity exists for making a most important contribution to a knowledge of our earth. Surprising though it may appear, the Antarctic terra incognita covers an area of at least 4,000,000 square miles, or considerably more than the area of the semi-continent of Europe. The main object of the expedition is, naturally, the attainment of the farthest southern point possible, and probably an effort will be made to follow in the path of Weddell, who, in 1823, reached the surprisingly high latitude of 74 degrees 15 minutes south. It will be most interesting to note if the methods of traveling over the ice cap introduced by Peary and Nansen will be possible here, a condition that will probably be largely determined by the practicability, or impracticability, of an ascent of the vertical face of the so-called Antarctic barrier—the great Chinese wall of the south. In whatever manner conceived, the work of the expedition will be looked forward to with much interest, especially at this time when scientists are inclined to believe that the earth is top-shaped rather than spherical, and that the apex of the top is approximately the south pole.

LORD KELVIN has invented and put into successful operation at Shoreditch, England, a garbage crematory. Its action is mainly automatic, by means of electricity. The lifting and emptying are done by automatic electric hoists, which deposit the garbage into cells, where it is burned. The heat of the furnace is intense, and it is increased by forced draft. The air to produce the tremendous draft in the furnaces is drawn by pumping machines from the city sewers. Thus the sewers are ventilated and their noxious gases destroyed. The heat produced incidentally is used for making steam, and that runs dynamos for any firm wanting manufacturing power.

Electrical Progress.

Telephony from a Layman's Standpoint.

Electrical engineering, as applied to the innumerable improvements in the construction of telephone instruments, is accomplishing new triumphs daily. The rapidity with which the distance over which telephonic communication can be had exceeds the most vivid imagination.

The mystery of it all is a cause of never-ceasing wonder. One can arise from the place where he is writing and call, from his desk, a friend in Los Angeles. The impulse of his voice goes out through a gimlet hole in the wall, speeds away over the housetops, through the smoke and noise of roaring shops and factories, out across fields, rivers, lakes and mountains, through towns and villages. It passes through forests, where birds are singing; it passes the farmer's wagon toiling along the country road; it goes past schoolhouses where children are droning over their books. It perhaps encounters a thunder storm, but on it goes through every sort of sight and scene, over the roofs and through the roar of cities, straight from the vocal chords to the tympanum of the receiver at the other end, which little bit of metal transposes the vibrations into articulate speech, and it in turn tells to his friend the thoughts that he is uttering. It not only does this, but it does it so faithfully that one is able to recognize the tones of the other's voice and would probably be able to discover the identity without the necessity of announcing it. The performance of this little tympanum in the receiver is one of the most curious of the many curious things about it. It had been supposed that in order to produce articulate speech certain motions of the mouth, which could not be imitated, were necessary, but here is a little flat piece of metal that actually talks, and talks plainly, too. The vibrations of the vocal chords, modified by the mouth, teeth, tongue and lips—for we use them all in talking—has set up similar vibrations in the transmitter; and these vibrations, unseen and unfelt, have somehow or other, by the aid of electricity, traveled a great distance. Imperceptible and weak as they are, they have in all their long journey lost not one whit of their quality, tone or accuracy. Every infinitesimal inflection has been retained; and, all in their proper order, they strike the diaphragm of the receiver and the receiver talks.

It gets there. But how? Does it drive straight through the hundreds of miles of copper wire which stretch out between the two cities, or does it travel on the surface of the wire? Ask the telephone expert and he will tell you he does not know. It is certain that the wire has something to do with it in the present state of the art. But it may be done without a wire. In an experimental way, telephone messages have been sent by the aid of a ray of light. It has carried the vibrations of sound and reproduced them in the same way as is done by the aid of a wire and the electric current.

Reflection on the subject leads to doubt whether there is really any such thing as distance. Maybe one's friend could hear ordinary conversation at so great a distance without any instrument if he had the right kind of an ear. It has been recently demonstrated that telegraphing can be carried on through long distances without any wires, provided the proper instruments are at hand to catch the vibrations and make them perceptible to the human ear. It has been discovered that there are invisible rays of light which penetrate opaque substances, and that there are sounds which the human ear is incapable of apprehending. All sound and light is caused by vibrations, and only those within a certain compass produce any effect upon organs of sight and hearing.

If a beam of light can so arrange the medium for the conveyance of sound that the vibrations that produce it will follow its direction and be reproduced, is there any limit to the range of sound? May we not one of these days hear the roar of the conflagration on the sun? May our ears not catch the sounds on Mars and on the other planets and stars, and may we not converse with their inhabitants, if they have any? None of these are much more wonderful than the performances of the little talking disc which repeats our conversation to our friend so far away.

Storage Batteries for Electric Power Stations.

For electrical plants the use of accumulators as a means of steadying the load diagram is a favorite method. Theoretically, the generators could be operated uniformly, provided sufficient accumulator capacity were arranged to absorb and store the surplus energy developed during hours of light load, and European experience has justified the value of this practice. In America results have not been so favorable. This is partially attributable to the higher load factors there, the average being 35 to 40 per cent against 15 to 20 per cent in Europe. In America the storage-battery industry has for so long been involved in legal complications that central station managers have been reluctant to invest in plants as possible subjects of litigation.

The accumulator has been passing through a period of experimental development, involving its action in so much obscurity as to preclude reliable estimates of life and prevent any accurate knowledge of the true rates of deterioration. Spurred by competition, manufacturers overrate their product, and the resulting list of battery plats consigned to the scrap heap is disheartening. Finally, the prices charged by American makers, together with their reluctance to assume the responsibility for imperfect manufacture, have made the American storage battery installation almost an unknown type. As German prices are about 0.6 as much per unit of capacity as American, and as German manufacturers will insure perpetual maintenance at 4 per cent on the cost of the cells, the slow progress of American accumulator plants is not difficult to understand.—A. V. Abbott in Cassier's Magazine.

THE danger peculiar to electrical generating works is the liability to shock, which is often fatal if by accident any one comes into contact with the conductors when charged to a high pressure, says the London *Electrician*. The contact need neither be very perfect nor direct. Provided two parts of the body are made to touch conducting materials which themselves differ in pressure by 1000 volts or more, or even by much less if the contact with the flesh is very good, a dangerous and possibly fatal shock will result. The ground, especially if damp, is sufficient for one of the contacts, damp leather boots affording no protection, so that any one standing on the ground or on metallic or damp wood flooring cannot safely touch a single object charged to a dangerous pressure. If, however, he should be standing upon a dry india-rubber mat, which is an excellent non-conductor, he will come to no harm on touching any number of dangerously charged bodies which are at the same electrical pressure; but if he should simultaneously touch, even through his clothes, two bodies which differ from one another in pressure by about 1000 volts, the actual amount depending largely on the perfection of the contact; or, if while safely touching highly charged metal, he should touch or pass by hand any conducting article to some one else who is not also insulated, then a fatal shock may follow.

MONS. C. CHENEVEAN suggests, as a means of removing the thin film of oxide from aluminum goods, preparatory to electroplating them, to immerse the goods in a solution of an alkaline carbonate, followed by treatment with hot dilute hydrochloric acid (one in 20), and final immersion in a dilute solution of copper sulphate.

Mechanical Progress.

By-products in Coke Making.

The chief of the by-products utilized by the by-product oven systems is ammonia. Hitherto the sole source of supply of ammonia in the United States was in the illuminating gas plants, but the use of electricity and of water gas has decreased the production of the article, while the demand for it has been on the increase. Ammonia has many uses. It is an essential material in ice manufacturing, in electrical batteries, in chemical manufactures, and in the manufacture of fertilizers it is substituted for nitrate of soda. The yield of ammonia from regular coking coal is about twenty pounds per ton of coke produced, and at the minimum value of $20 per ton this product alone would be worth 20 cents for each ton of coke.

Two kinds of gas are obtained from coal by means of the retort coke oven system. These are illuminating gas and manufacturing or fuel gas. The latter makes a very good substitute for natural gas. The production of illuminating gas in the retort oven involves a change in the operation of the oven, so that ordinarily produced gas, with the recuperation of both gas and air, may be burned in the flues instead of the rich coke oven gas. It has been estimated that for each ton of coke produced upward of 8000 cubic feet of gas are given off, and the entire product yielded annually in the United States by the coking of coal, allowing one-half to be consumed in the coking process, is upward of 60,000,000,000 cubic feet, or but little less than one-fourth of the annual natural gas production during the height of that excitement.

By-product oven tar is superior to the tar which comes from the gas works. It contains less pitch. The yield for each ton of coke varies from forty to one hundred pounds, according to the amount of volatile matter contained in the coal. It has a fuel value equivalent to $5 per ton, or that obtained by coking a ton of coal is worth from 10 to 25 cents. As a roofing and paving material this tar has a value of about $8 per ton.

As a material for the manufacture of fuel briquettes, coke oven tar stands pre-eminent. In addition to the above uses, this tar, after passing through the complex processes of modern chemistry, comes to us in the form of aniline dyes, saccharine, benzol and other products.—William G. Irwin in Cassier's Magazine.

Mounting Machinery on Springs.

"Should machinery be mounted on springs?" is a question of present discussion. Those who argue in favor of mounting an engine or dynamo on springs say "if gear wants to wobble let it wobble."

If one considers say a direct-acting pump in space, it is a system that of course cannot move its center of gravity as a whole. If, then, its pistons and plunger move in one direction, the rest must move in another direction, the distance depending on their masses. Any imperfectly balanced machinery must, therefore, move its bed plate if freely suspended. A perfectly balanced engine is thus an engine whose center of gravity never varies relatively to its bed plate. This definition is really too small, because a moving system, such, for instance, as two cranks at 120° on opposite ends of a shaft, do not change their center of gravity, but give the bed plate a rocking but non-transitional movement. A gas engine with a flywheel similarly tends to rotate its bed plate at each impulse around an axis parallel to that of the shaft. A balanced engine is, therefore, really one which does not move its bed plate if freely suspended. Such an engine is practically never realized.

When an engineer sees an engine bed plate moving, his first instinct is to bolt it down; it then moves a little less, but still moves, and he has a sort of feeling that it must shake itself to pieces if allowed to move. Bolting down an engine to a bed of concrete is merely increasing the size of its effective bed plate, but the whole bed plate, including the concrete, must now be moved. It rests on the earth, moves slightly, and communicates vibration to neighbors who are longing to be compensated for disturbance. Sometimes the concrete bed plate is isolated by mounting it on felt. That means that the larger bed plate is mounted on imperfect springs.

"The question is, if the bed plate of an engine wants to move, why should it not have free play? As far as the engine goes, a little thought will show that all its parts are subjected to smaller stresses if the bed plate is free to move. An engine will, therefore, wear longer if it is allowed to move its bed plate."

Knocking in Engines in Steam Spaces.

When an engine knocks heavily at starting at each end of its piston stroke, even a tyro knows that there is water in the cylinder, and that he has probably forgotten to open the drain cocks. The warning given by the engine is clear and emphatic, and must be attended to instantly. But sometimes the message is conveyed in another way: There is a muffled blow of the piston and a sharp crack is heard with each stroke. This does not come from the piston, but from the slide valve. This message also tells of water, but from the dull sound of the piston knock we learn that an early compression, by cushioning the steam, drives out the imprisoned water before the piston can strike it with a hammer action. We also know that, as the exhaust port of the valve is shut, something must give way to allow of the escape of the water. The line of least resistance to this escape is at the valve, which is driven back from its face. It is true that the steam in the valve chest is pressing the valve down, but the pressure below it being greater for the moment, the valve rises slightly to allow a thin sheet of water to rush across the port bridge to the exhaust. Then, with the normal motion of the valve moved by the valve rod, a free course is given through the ports; the steam pressure reasserts itself, and with a sharp sound the valve is clapped down upon its face again.

But here, again, we may have variations in the message. The knock of the valve may be of less loudness than is usual when water is imprisoned, and at the same time there might be a total absence of a cylinder knock. Also, the engine may have been running for some time, while the valve click still continues. The engineer has drained the cylinder well, and the cylinder walls are thoroughly heated. The indicator diagram is examined. Then, if the steam compression line shoots higher than the steam line, the clicking of the valve tells that too much compression is being caused by a faulty proportion or setting of the valve.

If the valve has been recently set, and the knock is a new one to the engine, then the valve setting alone is wrong. In this case the knock will be at one end only of the valve stroke, and the excessive compression will be seen only at one end of the double diagram. Thus, by reflection, the engineer can interpret accurately the meaning of the message imparted to him by the engine.

But there is yet another case where the valve is knocked off its face. The valve has been set correctly, and the engine has been at work for some time before the clicking sound is heard. In this case, also, the diagram shows a compression higher than the steam pressure from the boiler, and also only at one end. Other peculiarities of the diagram will also be seen. The compression as it begins on the exhaust line will be right at the end, but be too late at the other end. In fact, on the return stroke everything will be late. Originally the diagram was good, but now the valve has got out of setting at one end, while it is right at the other. For this there is only one explanation, which is that the valve has got partly adrift on its rod. The cotter pin at one end has dropped out and the nuts have slackened back at the end, while the nuts at the other end have retained their position.

Though in this, as in some other cases, the knocking in steam spaces may not by itself tell us everything, yet by comparing the written with the spoken message of the engine we soon arrive at a right conclusion as to what the engine is complaining about. But in all ordinary cases it is not always realized, except by those "in the know," how valuable a guide to defects is given by the varying sounds of an engine, not only in the steam spaces, but in every other part of the mechanism.

THE steel for locomotive boilers is supplied by contract in the shape of flat, rectangular sheets. Before it is accepted the tensile and breaking strength of each one is tested. Next it is marked off by measure with chalk lines for rivet holes, which are punched through it by a machine that does the work as quickly and easily as if it were a slice of cheese. Then the sheet is trimmed to the proper size by a great steel knife, which cuts off the edges like paper. Finally it is turned into a curved shape by passing between huge rollers, and is riveted to other sheets, which make up the cylindrical tube of the boiler, by means of redhot iron bolts. A boilermaking shop is notoriously the noisiest place on earth, but it is surprising to find how soon one gets used to the clamor, so that it would be possible to lie down and sleep amid it all. There is nothing like getting used to things. Every now and then a man is killed in the works by having a boiler roll upon him. He has had such long practice in eluding dangers of the sort that he becomes too indifferent, stepping out of the way a moment too late.

THE master mechanic of the Santa Fe road is quoted as saying that by the use in the Santa Fe shops of a stationary compressed air riveting machine three men are enabled to drive 2000 rivets per day of ten hours at a cost of $4.75, as compared with 200 rivets per day at a cost of $7 by hand labor; the truck riveters—the machine being operated by two laborers at a total cost of $3 per day—drive 3000 rivets, as compared with 175 rivets driven by hand labor by three men in a day at a cost of $6, while the staybolt breaker makes an average saving of $8 per day and the tank riveter an average daily saving of $10. Further, the mud-ring riveters will drive as many rivets as can be handed to them, and will make a saving of $12 to $15 a day for that class of work. This method is declared to insure every rivet hole being filled entirely and insures tight work, while of hand-driven rivets in mud-rings a large percentage invariably leak.

IN sextant observations on shipboard it is often difficult to make measurements from the horizon, and various unsatisfactory attempts have been made to substitute some mechanical or other means of determining the horizontal or vertical. A novel plan—claimed to have been put to practical use on land and sea—has been suggested in France by Rear Admiral Fleurais. It consists in adding to the ordinary sextant a horizontal gyroscope, which is placed in front of the telescope and behind the small mirror, and contains in its upper part two small plano-convex lenses, placed at a distance apart equal to their focal length. On the plane faces of the lenses are engraved two lines parallel to the equator from the gyroscope. The gyroscope is rotated 80 to 100 turns a second, and the horizontal is obtained by observing the position of the figures described by these lines as the lenses revolve.

In New York City, recently, the first official trip of the compressed air motor, designed by Robert Hardy, was made on the Sixth Avenue division of the Manhattan Elevated Railway. General Manager Franzioli and a number of engineers were on board the train, which made the run from Rector to Fifty-eighth street, over five miles, in eighteen minutes. On the return trip stops were made at each of the stations, and the regular schedule of twenty-seven minutes for the round trip was maintained. The trial was a successful one; the motor carried a charge of compressed air of 2500 pounds to the square inch.

Scientific Progress.

Innovations in Stamp Practice.

Recent articles on the above subject have aroused so much interest and inquiry that further information on this subject from D. B. Morison, who proposes to lift the stamps by levers, instead of cams, is of present value.

Continuing his remarks, as quoted on page 168, No. 8 of this volume, he says:

The practical deductions which can be made from these experiments are that a cam stamp having a 7-inch drop cannot be driven at more than 94 to 98 drops per minute in ordinary everyday work, and that the falling weight loses in wet crushing at least 17 per cent of its possible efficiency, due to retardation through friction, and under the average condition of work this will probably be increased to from 20 to 25 per cent. * * * In attempting to improve the cam battery, it should be borne in mind that it represents the combined efforts of mining engineers during the last fifty years, and a vast amount of care and ingenuity have been expended on its available perfection, so that when the writer commenced on the problem he adopted the principle of "leaving well alone," by retaining every detail of the modern gravity battery in its present form, with the exception of the cam and tappet.

The improvements desired were:

1. Increased mechanical efficiency.
   - Decreased vibration;
   - Less friction;
   - Less fuel per ton of quartz crushed.
2. Increased drops per minute.
   - Decreased weight of mill per ton crushed;
   - Less floor area;
   - Less cost of transport.
3. Greater output per stamp head.
   - Decreased labor per ton of output.
4. Ability to convert existing machines.
   - Increased output from existing mines;
   - Decreased cost of production.
5. Simplicity of mechanism.

The high-speed gravitation stamp mill is constructed as follows:

On the top of a frame is a crank shaft with five cranks at equal angles, each of which is provided with a connecting rod jointed to a cylinder in such a way that, as the crank revolves, the cylinder moves up and down. Within the cylinder is a deep plug or piston, the rod of which passes through the cylinder bottom, and constitutes the stem to which the stamp head is attached. A jacket surrounds the cylinder, and at a distance from the bottom is an aperture or port communicating with the jacket space; another port at the top of the cylinder also makes the cylinder and jacket common to one another. The cylinder below the lower port is filled with liquid, the jacket also contains liquid, and above the liquid is air space—both in the cylinder and in the jacket. When the bottom of the piston closes the lower port and the cylinder moves upwards, the piston and stamp head are supported by a body of liquid. If none of this escapes, and the down strokes of the cylinder do not exceed the number which the stamp head could make under the action of gravity, minus the retardation through friction, and if the length of stroke of stamp head is the same as that of the cylinder, the position of the piston within the cylinder remains constant, and the liquid is practically undisturbed. If, however, the stroke of the stamp head is less than that of the cylinder,

and the speed of rotation is, as before, within practical gravity limits, it follows, when the shoe strikes the die, and the cylinder has completed its stroke, that the position of the bottom of the piston is above the cut-off point by an amount equal to the difference of stroke between the stamp head and the cylinder, this space being filled with liquid, which has been drawn in from the jacket. On the upstroke of the cylinder this liquid is forced into the receiver until the cut-off position is reached, when the piston is again raised on a liquid medium as before. It is evident that if the point of pick-up occurs before mid-stroke, that the stamp head will acquire the same upward velocity as the cylinder; the latter comes to rest, however, by the action of the crank, whilst the former is governed by the retarding influences of gravity and friction, so that at the ordinary working speeds the piston will continue its upward motion after the upstroke of the cylinder by an amount dependent on the velocity acquired at about mid-stroke. At certain velocities of rotation, when the stamp head commences to fall, the cylinder will have completed a portion of its down stroke, and if the velocity of fall of the cylinder is not less than that due to gravity, minus friction, the velocity of fall of the stamp head will be increased by the assisting effect of the friction between the surfaces of the cylinder and piston, and also between the rod and the packing, with the result that a very much greater number of drops can be obtained than is possible with the cam arrangement.

The liquid used is water, with a sufficient addition of soap for the purpose of lubrication and to prevent corrosion, and the quantity of liquid is maintained by the continuous flow from a small supply pump from a fixed tank—inflow and outflow being by means of small tubes, one small pump being sufficient for any number of stamps. The upper part of the cylinder above the top port is grooved longitudinally, so that, if a stamp head is hung up, the air passes from one side of the piston to the other without resistance.

In order to provide for the wearing of the shoe, and the consequent lowering of the piston within the cylinder, several cut-off holes are provided at about 1½-inch pitch, so that on the shoe and die wearing to that extent, all that is necessary is to unscrew the next lower plug—thus establishing a new cut-off port 1½ inches lower than the previous one. It has been found that the piston, floating as it does on a quantity of liquid, renders the stem so susceptible to rotation that the shoe rarely strikes the die without certain rotary movement resulting, and it is probable that this will be found sufficient in practice to ensure the even wearing of the surface of the shoe and die; but, if desired, a very simple system of turning gear can be fitted, which works very effectively. No trouble is experienced through leakage at the gland, as midway in the stuffing box is a lantern bush connected to the jacket, so that the packing below this bush is only subjected to the head of liquid in the jacket, or under one pound per square inch. Special attention has also been given to the danger of any lubricant falling into the mortar—the lower supporting frame being constructed of trough form, with an inclined base, so that all waste lubricant is caught and retained.

Exploring South Polar Regions.

The course of at least one expedition will be directed to the south polar regions during the present summer. The expedition of Lieut. Gerlache, which was to have sailed from Antwerp last year, but which for various reasons — especially financial — was obliged to postpone its departure for a time, sailed from European waters on Monday, the full guarantee fund of 250,000 francs having apparently been raised, largely, it is said, through the agency of influential women who took an interest in the enterprise. The destination of Lieut. Gerlache is the region about Graham Land, or more properly Graham archipelago, that part of the Antarctic world which lies almost due south of the apex of the South American continent. It is this tract which is now generally assumed to have been at one time, a time not very remote in geological history, united with the northern land, the fragments of disruption between the two being still seen in the island groups—Falkland islands, South Shetland islands, South Georgia, etc.—which lie in the twist of the broken Andean system. The Norwegian Larsen visited the region in the latter part of 1893, and succeeded in penetrating beyond the 68th parallel of south latitude. To him is due the discovery of the first traces of organic life contained in any rock mass appertaining to Antarctica, a discovery which has thrown new and unexpected light upon the physical conditions which are bound in with the southern pole of our planet. The fossils are of most interest in their botanical relations, for in the discovery of the remains of a forest of the Chilean pine or araucaria we have a most marked contrast presented to the utter barrenness which is exhibited by the floral display of to-day, not a trace of vegetation higher in organization than a lichen having up to the present moment been detected in the entire Antarctic world. This climatic contrast between the past and the present sees itself repeated in the antipodal north, where the stone remains of Atane, Atanekerdluk, and Patoot, in Western Greenland, read the history of giant forests and foresters in place of the lowly vegetation of 6 or 8 inches of today. To Capt. Larsen is also due the discovery of volcanic activity in this part of the Antartic world, Lindenberg and Christensen islands being in a condition of eruption at the time of his visit. A half century earlier Ross had found Mt. Erebus, on Victoria Land, south of Australia, in a similar condition of activity, the fiery volcano rising to the stupendous elevation of 12,000 feet, presenting one of the most sublime spectacles that it has been the good fortune of man to gaze upon.

What may be the extent of Mr. Gerlache's discoveries it is naturally impossible to foretell, but certain it is that opportunity exists for making a most important contribution to a knowledge of our earth. Surprising though it may appear, the Antarctic terra incognita covers an area of at least 4,000,000 square miles, or considerably more than the area of the semi-continent of Europe. The main object of the expedition is, naturally, the attainment of the farthest southern point possible, and probably an effort will be made to follow in the path of Weddell, who, in 1823, reached the surprisingly high latitude of 74 degrees 15 minutes south. It will be most interesting to note if the methods of traveling over the ice cap introduced by Peary and Nansen will be possible here, a condition that will probably be largely determined by the practicability, or impracticability, of an ascent of the vertical face of the so-called Antarctic barrier—the great Chinese wall of the south. In whatever manner conceived, the work of the expedition will be looked forward to with much interest, especially at this time when scientists are inclined to believe that the earth is top-shaped rather than spherical, and that the apex of the top is approximately the south pole.

LORD KELVIN has invented and put into successful operation at Shoreditch, England, a garbage crematory. Its action is mainly automatic, by means of electricity. The lifting and emptying are done by automatic electric hoists, which deposit the garbage into cells, where it is burned. The heat of the furnace is intense, and it is increased by forced draft. The air to produce the tremendous draft in the furnaces is drawn by pumping machines from the city sewers. Thus the sewers are ventilated and their noxious gases destroyed. The heat produced incidentally is used for making steam, and that runs dynamos for any firm wanting manufacturing power.

Electrical Progress.

Telephony from a Layman's Standpoint.

Electrical engineering, as applied to the innumerable improvements in the construction of telephone instruments, is accomplishing new triumphs daily. The rapidity with which the distance over which telephonic communication can be had exceeds the most vivid imagination.

The mystery of it all is a cause of never-ceasing wonder. One can arise from the place where he is writing and call, from his desk, a friend in Los Angeles. The impulse of his voice goes out through a gimlet hole in the wall, speeds away over the housetops, through the smoke and noise of roaring shops and factories, out across fields, rivers, lakes and mountains, through towns and villages. It passes through forests, where birds are singing; it passes the farmer's wagon toiling along the country road; it goes past schoolhouses where children are droning over their books. It perhaps encounters a thunder storm, but on it goes through every sort of sight and scene, over the roofs and through the roar of cities, straight from the vocal chords to the tympanum of the receiver at the other end, which little bit of metal transposes the vibrations into articulate speech, and it in turn tells to his friend the thoughts that he is uttering. It not only does this, but it does it so faithfully that one is able to recognize the tones of the other's voice and would probably be able to discover the identity without the necessity of announcing it. The performance of this little tympanum in the receiver is one of the most curious of the many curious things about it. It had been supposed that in order to produce articulate speech certain motions of the mouth, which could not be imitated, were necessary, but here is a little flat piece of metal that actually talks, and talks plainly, too. The vibrations of the vocal chords, modified by the mouth, teeth, tongue and lips—for we use them all in talking—has set up similar vibrations in the transmitter; and these vibrations, unseen and unfelt, have somehow or other, by the aid of electricity, traveled a great distance. Imperceptible and weak as they are, they have in all their long journey lost not one whit of their quality, tone or accuracy. Every infinitesimal inflection has been retained; and, all in their proper order, they strike the diaphragm of the receiver and the receiver talks.

It gets there. But how? Does it drive straight through the hundreds of miles of copper wire which stretch out between the two cities, or does it travel on the surface of the wire? Ask the telephone expert and he will tell you he does not know. It is certain that the wire has something to do with it in the present state of the art. But it may be done without a wire. In an experimental way, telephone messages have been sent by the aid of a ray of light. It has carried the vibrations of sound and reproduced them in the same way as is done by the aid of a wire and the electric current.

Reflection on the subject leads to doubt whether there is really any such thing as distance. Maybe one's friend could hear ordinary conversation at so great a distance without any instrument if he had the right kind of an ear. It has been recently demonstrated that telegraphing can be carried on through long distances without any wires, provided the proper instruments are at hand to catch the vibrations and make them perceptible to the human ear. It has been discovered that there are invisible rays of light which penetrate opaque substances, and that there are sounds which the human ear is incapable of apprehending. All sound and light is caused by vibrations, and only those within a certain compass produce any effect upon organs of sight and hearing.

If a beam of light can so arrange the medium for the conveyance of sound that the vibrations that produce it will follow its direction and be reproduced, is there any limit to the range of sound? May we not one of these days hear the roar of the conflagration on the sun? May our ears not catch the sounds on Mars and on the other planets and stars, and may we not converse with their inhabitants, if they have any? None of these are much more wonderful than the performances of the little talking disc which repeats our conversation to our friend so far away.

Storage Batteries for Electric Power Stations.

For electrical plants the use of accumulators as a means of steadying the load diagram is a favorite method. Theoretically, the generators could be operated uniformly, provided sufficient accumulator capacity were arranged to absorb and store the surplus energy developed during hours of light load, and European experience has justified the value of this practice. In America results have not been so favorable. This is partially attributable to the higher load factors there, the average being 35 to 40 per cent against 15 to 20 per cent in Europe. In America the storage-battery industry has for so long been involved in legal complications that central station managers have been reluctant to invest in plants as possible subjects of litigation.

The accumulator has been passing through a period of experimental development, involving its action in so much obscurity as to preclude reliable estimates of life and prevent any accurate knowledge of the true rates of deterioration. Spurred by competition, manufacturers overrate their product, and the resulting list of battery plats consigned to the scrap heap is disheartening. Finally, the prices charged by American makers, together with their reluctance to assume the responsibility for imperfect manufacture, have made the American storage battery installation almost an unknown type. As German prices are about 0.6 as much per unit of capacity as American, and as German manufacturers will insure perpetual maintenance at 4 per cent on the cost of the cells, the slow progress of American accumulator plants is not difficult to understand.—A. V. Abbott in Cassier's Magazine.

THE danger peculiar to electrical generating works is the liability to shock, which is often fatal if by accident any one comes into contact with the conductors when charged to a high pressure, says the London *Electrician*. The contact need neither be very perfect nor direct. Provided two parts of the body are made to touch conducting materials which themselves differ in pressure by 1000 volts or more, or even by much less if the contact with the flesh is very good, a dangerous and possibly fatal shock will result. The ground, especially if damp, is sufficient for one of the contacts, damp leather boots affording no protection, so that any one standing on the ground or on metallic or damp wood flooring cannot safely touch a single object charged to a dangerous pressure. If, however, he should be standing upon a dry india-rubber mat, which is an excellent non-conductor, he will come to no harm on touching any number of dangerously charged bodies which are at the same electrical pressure; but if he should simultaneously touch, even through his clothes, two bodies which differ from one another in pressure by about 1000 volts, the actual amount depending largely on the perfection of the contact; or, if while safely touching highly charged metal, he should touch or pass by hand any conducting article to some one else who is not also insulated, then a fatal shock may follow.

MONS. C. CHENEVEAN suggests, as a means of removing the thin film of oxide from aluminum goods, preparatory to electroplating them, to immerse the goods in a solution of an alkaline carbonate, followed by treatment with hot dilute hydrochloric acid (one in 20), and final immersion in a dilute solution of copper sulphate.

Mining Summary.

(Continued from page 219.)

ity of purchasing the Gray property, which lies between the Red Lion and the Frick properties. Should the deal be consummated, it is the intention of the purchasers to experiment with the cyanide process on the ores of the property.

SOUTH DAKOTA.

G. E. Bretelle, of Lead, manager of the Rochester-Greenback Mining Company, has begun the erection of a 1200 H. P. electric plant on Spearfish creek, a mile below Elmore station. The erection of this plant will be followed by the establishment of various manufacturing and milling industries on Spearfish creek, power for which will be furnished by this electric plant.

WYOMING.

At Douglas the copper properties of Messrs. Hazen & Scnoenfeldt are showing increased value as the vein is opened up. At a depth of 38 feet the vein is 4 feet thick and assays $56 to the ton.

W. E. Anderson, in the Four Mile placer district, has decided that the necessary water for working the placers can be obtained by the means of artesian wells, and will let contracts for 5000 feet of well digging for gold-washing purposes. The wells will be twenty in number, with an average depth of 250 feet, at a probable cost of $6 per foot; $20,000 will be expended in the construction of ditches, flumes and gold-saving plants.

B. E. Shear and New York capitalists have 5000 acres of placer ground in Timberlake gulch. The owners contemplate building a canal forty-five miles long.

NEW MEXICO.

In the Red River country, on Bitter creek, a ten-ton Kincaid mill is going up on the Midnight property. The owners are putting in an 80 H. P. hoist and a pump of sufficient capacity to handle the water.

C. C. Cotton, manager of the Memphis, is figuring on putting the mine in good working order and then putting in a mill to treat the ore from the property, in place of shipping to Pueblo, as has been done for some time past at considerable expense.

In Taos county a German company is putting in machinery to work the placers at the head of Red river, and is also putting in plants for the same purpose at La Belle, near Elizabethtown, and at Red River City. On Gold Hill the find made by the Gusdorfs is proving all that was expected of it. The Franklin Placer Company on Red river is reported to have met with very satisfactory results. The cyanide process for treating ores is being introduced in a number of the camps.

At Hopewell the company operating the Red Jacket mine and electro-cyanide mill has had a satisfactory cleanup. E. Sterling will start a cyanide mill this week to treat ores.

COLORADO.

Col. Havens says a claim in Leadville in which he spent $60,000 he recently leased to some Kansas farmers, who organized a company with a capital of $150,000. They spent $82,000 more before they shipped a pound of ore. "But they are making money now, and are paying us royalties running up to 50 per cent. This on $35 ore. They have paid us $213,000, and will probably continue to pay for years. The lease is for ten years, but we told them they could have twenty years if they wanted them. I know of many leasing companies that are making money."

Receipts of gold at the United States branch mint in Denver for the fiscal month of August amounted to $1,215,237.58. The receipts for August, 1896, were $329,459.89. The total receipts this year since January 1 amount to $7,288,722.97. It is estimated that the amount of gold received at the mint during '97 will be in the neighborhood of $11,000,000.

Another oil well has been put down by the Carbon Oil Company at Florence. The hole, 1300 feet deep, has filled up 600 feet with oil.

At Cripple Creek the following figures on the June and July production and expenses for the same period are furnished by the Isabella Gold Mining Company:

	June.	*July.*
June, gross earnings	$28,700	$34,100
Net earnings	18,700	23,150
Expenses	18,700	20,350

There was a profit for July of $2800. The cash reserve on hand August 1st stood at $103,000.

At Manhattan the Monte Cristo tunnel has attained a depth of 400 feet and runs in 4 feet of ore, which averages $20 to the ton. J. H. Whedbee is having the ore examined with a view of putting in reduction works.

At Black Hawk the output of the Nevadaville mines, operated by the Gold Coin Mines Company, for the past month was $24,000. The Phœnix Burroughs mine on Quartz Hill continues to be the largest single producer in this county, its daily ore output being fifteen cars, or at least 100 tons. At the Nugget mine in Illinois Central district sinking is being carried on with three eight-hour shifts. At the Topeka mine sinking is being carried on with eight shifts, on a lift of 100 feet, commencing at a depth of 850 feet. The present force consists of thirty men.

A recent Denver invention is the Parker rotary stamp mill, in which the stamps have a rotary, grinding motion upon the ore in the mortar. The mill is a battery of four stamps in a quadrangular frame; the motion is imparted from a central upright shaft and cogwheel geared into cogwheels on the stems of the stamps, which give the grinding motion on the ore. The cams which lift the stamps are cast on the cogwheels of stems of the stamps, and are half the circumference of these cogwheels. This gives the stamps a rotary motion of half their circumference every time the stamps drop. It is claimed that the best results in grinding are secured with a speed of sixty drops to the minute, and that at this rate of speed better results are obtained than with the ordinary stamp mill at a speed of ninety drops to the minute. A special feature of the mill is the feed arrangement. The ore is carried to a hopper above, from which it is fed through spouts to the mortars. The valves in these spouts are opened by a collar on the stems of the stamps as the stamps strike the ore. When the ore in the mortar gets too high, the collar does not touch the spring connected with the valve and no ore escapes. The stamps weigh 932 pounds.

Correspondence of the Denver *News* says the Casper refinery has within the last few months been exhaustively improved and also extended in its actual scope. A new 150-barrel still has been added, at an expense of $2500, making the capacity of the refinery 200 barrels per day instead of fifty barrels; a filtering press of thirty faucets and capable of filtering 300 barreis of oil per day, has been put in at a cost of $1000; a large number of electrically molded iron barrels for shipping purposes has been added, and the refining fuel has been changed from coal to oil itself, with the advantages of labor-saving, superior sevice, and an actual economy of $7 per day in fuel cost.

The Colorado Fuel Company has cut the price of anthracite coal from $9.25 to $6.50 per ton. This is the lowest figure ever quoted in the Denver market for this class of coal.

ARIZONA.

Thomas Withers, superintendent Table Mountain Copper Co., is building a road begun near Dunlaps to the Table Mountain mines. Captain Burgess is the general manager of the company.

The Dry Roller Process Quartz Company of Los Angeles, capital stock $300,000, has incorporated with the Territorial secretary at Phœnix. Incorporators are S. G. Lyons, D. E. Young, H. M. Moulton, Los Angeles.

Winningham, Dillon & Nichols of Jerome have bonded the Winningham group of five mining claims to Galveston, Texas, parties, who pay $50,000 in eighteen months and six months $75,000. Winningham is to receive $100 monthly until the bond expires. The Galveston men must do certain work continuously for two years.

Wickenburg correspondence of the *Republican* says Helm & Bro. are making inroads on 60,000 tons of dump from the Vulture stamp mill of twenty years ago. The cyanide plant is doing good work.

At the Vulture the cyanide plant is in operation, besides a 10-stamp mill. A 10-inch water pipe from the Hassayampa to the mine is projected, with pumping station close to the river.

The Buckeye mine at Mineral Park is shipping ore.

The Schuylkill mine at Chloride is receiving a large amount of machinery. F. M. Theis is superintendent.

LOWER CALIFORNIA.

The sulphur mines on the Gulf coast, twenty miles above the mouth of the Rio Colorado, are a series of low hills—part of an extinct crater which, probably, as the heat subsided, allowed the liquid sulphur to solidify. The ore is found in immense masses, nearly pure, averaging over 80 per cent. Mr. Dubbs has arranged for transportation with the Colorado River Navigation Company and Southern Pacific Railroad Company, and the first shipments of ore will be made over these lines. The ore will be loaded on the river boats at the landing, five miles distant from the mine, and taken to Yuma, from which point it will be shipped by rail to its destination. The plans for an extensive refining plant, to be located at the mines, have been completed, and it is probable that within a year Lower California will be furnishing the Pacific coast with a part if not all of its refined sulphur. In addition to the property which Mr. Dubbs has leased of Mr. Godbe, he has located six other sulphur locations in the same vicinity.

At the Alamo gold diggings there is great excitement; the ground is reported rich; about twenty men have started for the new diggings.

MEXICO.

The Esperanza Mining Company, operating near Tultonango, State of Mexico, is on the Bonanza lead. They are taking out in gold ore $100,000 a month. A 40-stamp mill, ninety-five strokes to the minute and a 950-pound stem, works unceasingly. Another shaft is being sunk west of north of the Salzburg shaft by the Esperanza people, and it is down 130 feet, with identical ore indications. The camp at the Salzburg shaft is from 9000 to 10,000 feet above sea level.

In Durango, Chihuahua and Coahuila unusual activity is exhibited. Old districts are employing more men, putting up improved machinery, and turning out more ore than ever before.

The districts of El Oro, Inde and Guanacevi, Durango, and the Parral district in Chihuahua, show increased outputs. Guadaloupe y Calvo and Batopilas, in Chihuahua, are flourishing. At Mapimi a smelting plant, consisting of five furnaces, reducing 200 tons of ore per day for several years, has machinery on the ground to double its capacity. At Velardena, where the smelting plant is running to its full capacity upon ores belonging to the company, new discoveries of high grade silicious ores necessitate the construction of another reduction plant. The output of silver for '97 may reach 60,000,000 ounces. The El Oro property, in the State of Mexico, is paying $35,000 per month in gold, and a representative of Messrs. Haggin & Tevis, part owners, say they had refused an offer of the Rothschilds of $2,000,000 cash. The State of Oaxaca, south of the State of Mexico, has long been known to be rich in gold, and a good deal of work has been done by the arrastra system, driven by water or horse power. By this old-fashioned method a great deal of gold was lost in the tailings, and it is stated upon excellent authority that there are dumps containing several thousands of tons which will assay as high as an ounce to the ton. There is a field there for some process which will recover this gold. The State of Sonora is just now attracting attention, owing to the fact that the Yaqui Indians, who have always been so troublesome as to render prospecting absolutely impossible, have surrendered and their reservation is now open to the public. Of the six millions of gold exported from Mexico last year, Sonora furnished three and a quarter millions. The State of Guerrero is also showing up well in placers.

At Creston, Minas Prietas, Sonora, the roasters and cyanide plant are treating stuff at the rate of 100 tons per day. The method of treatment is unique, and these plants are believed to be the only ones in the world which are adopting the method in vogue at Prietas. The tailings are mixed with low-grade concentrates and then passed through the roaster with salt, in order to convert the silver into the form of chlorides. From the roaster the pulp goes on to cooling tanks, each tank taking 100 tons.

RUSSIA.

From Russia and Siberia come official reports to the State Department to the effect that the newly-found gold mines give promise of an enormous production. A report on the subject, recently made to this Government, estimates that eastern Siberia alone will give an annual production of gold amounting in value to $14,599,900. It is said that nowhere in the world are there such vast stores of gold, and nowhere is gold spread over so large a surface. The majority of the mines are situated far from the towns, and provisions have to be drawn. Considerable difficulties in regard to transportation are also experienced. The conditions in this respect and in regard to climate are similar to those of Alaska, and it is interesting to notice that the two great new gold fields of the world are so situated as to present the greatest difficulties for miners. Work in the Siberian gold fields can be carried on only for about 120 days in the year, from May to September, for the water and earth of the country are frozen during the rest of the year. During the cold season prospecting is carried on, however. The Siberian railway, now in process of construction, is expected to give gold mining a great impetus in the country.

AUSTRALIA.

The West Australia gold yield for '96 is as follows, with official details:

Total amount of gold exported during 1896, in ounces	281,265
Total yield of alluvial and dollied gold during 1896, in ounces	26,327
Total yield from auriferous quartz during 1896, in ounces	257,699
Total quantity of ore milled during 1896, in tons	166,015
Average yield of gold per ton of ore milled	1 oz. 11 dwts.
Number of gold-mining leases in force December 31, 1896	4,067
Area in acres of gold-mining leases in force December 31, 1896	58,676
Number of men employed at mines and upon prospecting work	20,818
Number of batteries	112
Number of stamps	1,349
Number of other reducing mills	35
Number of cyanide plants	10
Estimated value of mining machinery erected	£840,201
Total amount of gold exported to December 31, 1896, in ounces	967,625
Value	£3,676,977

Consul-General D. W. Maratta, at Melbourne, Australia, on the subject of treatment of gold ores in Australia, reports that the veinstone, which contains from about 1 to 12 per cent pyrites, but generally only from 3 to 5 per cent, is crushed wet in stamper boxes. The crushed material passes through stamper gratings containing from 80 to 290 holes to the square inch, and is as a rule delivered on amalgamated copper plates and mercury wells 7 inches deep at the back of the slide board and 2 inches in front of it, or simply onto plates having only mercury riffles; thence by gravitation onto blanket strakes or Halley's percussion tables or zigzag boxes; if onto blankets, thence onto Halley's table; but if onto Halley's table, thence onto blanket strakes; and if onto a labyrinth or zigzag boxes, thence into a buddle. In the first of these three cases the pulp collected on the blankets, and the refuse from the same, together with the tails, is concentrated or amalgamated in a revolving barrel, and from the barrel is then pumped into an inverted pyramidal box, whereby the slimes are, to a great extent, separated from the coarse sand, which is treated on vanners, while the slimes are collected in large settling tanks and then similarly treated. At times, without concentrating it or treating it by amalgamation in a barrel, the pulp being very poor in pyrites, the tail sand from the end of the blanket strakes is pumped into several pyramidal boxes, when the coarse sand and the slimes are treated on separate vanners. With the concentrates thus obtained, the blanket sand is treated by chlorination. Again, in some instances, though seldom, wooden strakes (boxes) and tyes are placed at the end of the blanket strakes, and thereafter, lastly, a canvas table.

In another crushing establishment the pulp from the blanket strakes is concentrated in percussion tables, the tailings from which flow into a sump. A tailings pump lifts the pulp onto a high platform, where it is distributed, without classification, on two long, fixed, threefold canvas tables, each about 110 feet in length. Although not treating veinstone only in one of the largest reduction works of the colony, the tailings from the blanket strakes, which are placed immediately below the amalgamated copper plates, flow into a pit and are raised thence and delivered into a trommel. The pulp passing through it is then classified in a long series of Spitzkasken (inverted pyramidal boxes) and the different grades obtained by that means are then concentrated on a number of Luhrig vanners.

Lately, the overwork of these has been somewhat relieved by the introduction of a great number of what may be termed endless intermittently revolving canvas vanners, about 120 feet in length, as a concentrate on a wooden platform during about a quarter of an hour, more or less, according to the mineral contents of the pulp, and are then made to revolve on rollers a length of about 8 feet, to enable the concentrates gathered on the upper portion of the canvas belt to be washed into the collecting trough. The "blanket sand" in that establishment is treated with a large quantity of mercury in what may be called a large Berdan basin, but without balls or drag. In the second of the three cases above mentioned, the Halleys tables having concentrated a large percentage of pyrites, mainly the coarsest particles, the pulp falls by gravitation onto blanket strakes; thence, without further classification, onto vanners; thence into wooden strakes, and finally, before running to waste, it is passed over canvas frames. In other instances the blanket sand collected at the end of the percussion tables is concentrated and the tailings from it flow into the battery tailings sump, thence the whole is pumped into a slime-separating, inverted pyramidal box. The coarser material issuing from the apex is concentrated, while the slimes, conveyed into settling tanks, are subsequently dressed on different vanners of the same type. Finally, the whole of the tailings pass over canvas frames.

Other reducing plants convey the blanket tailings directly by gravitation to the head of a series of wooden strakes and tyes, then pump them onto a platform, and then, in some cases, distribute the pulp, without any attempt at classification, onto a fixed canvas table.

Referring to the third method of treatment noted, the crushed material flowing from the end of the amalgamated plates into zigzag boxes is roughly classified in them. The heads and middles are concentrated in a Borlase concave buddle, fitted with iron scrapers set at an angle, but the tailings from the labyrinth and those of the buddle are collected in a sump, and thence raised by a tailings pump onto and distributed over an extensive area of blanket strakes. The large quantity of rich sand, collected from the sluicing of the blankets, is concentrated by an oscillating convex concentrator, which collects a considerable quantity of mercury and gold amalgam, separating it from the iron and arsenical pyrites, concentrate, and this from the sand which flows back into the pit. The tail sand from the fall of the blanket strakes is conveyed by a launder into an inverted pyramidal box, whence the coarser pulp escapes at the apex and is treated on vanners, while the slimes flow into another inverted pyramidal box, from the apex of which the heavier stuff, classified, is delivered onto slime vanners, and the overflow is concentrated onto a fixed canvas table about 30 feet in length.

There are a few establishments in which the treatment is differently effected. For instance, those in which the pulp, dropping from the end of the amalgamated copper plates, flows at once into a Denny & Watson grinding and amalgamating pan or other similar appliance to effect the same purpose, the overflow from which is allowed to run to waste, and the one establishment in which the veinstone is comminuted in a ball mill (Kugelmuhle) and the escaping pulp is treated more or less in the usual manner.

The concentrates obtained by the stamp-mill process, which consist generally of a mixture of arsenides and sulphides, arsenical pyrites (mispickel mostly), iron pyrites, and a slight admixture of galena, zinc blende, bournonite, etc., are roasted in either long (about 45 to 50 feet), slightly inclined furnaces or in 12 to 14 feet high revolving furnaces until most, if not all, of the iron contained in the concentrates has been oxidized to the state of sesquioxide of iron. The roasted ore is then, according to the grade of the particles of the gold therein, either subjected to the process of amalgamation in C. I. arrastras or treated by chlorination. In some establishments the Newberry and Vautin process is adopted, while in at least one mill the system of open vats is adopted, as at Mount Morgan in Queensland. In both cases the gold is precipitated from its solution on charcoal by percolating it through charcoal filters.

As an exception to the usual course of roasting the concentrates (pyrites) before the gold is extracted by amalgamation or chlorination, 112 tons of clean iron and arsenical pyrites were treated a few years ago by amalgamation by, first of all, grinding the pyrites in a Chilean mill to an impalpable pulp, then passing it in a diluted state through the force dollies charged with quicksilver, and thence in several sets of Rittinger's Hungarian mills, the whole of their working surfaces being covered with amalgamated copper plates and the basins charged with mercury. The result was very satisfactory, as the yield exceeded that obtained from the amalgamation of the roasted stuff, but the process was too slow, only from twelve to fifteen tons per month per Chilean mill being put through.

The actual loss of gold, on the average, in the treatment by open vats of concentrates averaging, as per assay, 6 ounces of gold to the ton, is 2 pennyweights of 23-carat gold to the ton, i. e., the gold saved equals 98.34 per cent of the assay value.

In another large establishment, in which the concentrates are treated by the Newberry-Vautin method, the loss of gold per ton averages 6 pennyweights from concentrates averaging, as per assay, 3 ounces 11 pennyweights 3 grains to the ton, i. e., the gold saved is equal to 91.66 per cent of the assay value. The cost per ton for treatment in the first case is $5.87 and in the second $9.91.

Very few mining companies extract gold from the concentrates in their works. Most of them either sell them to the amalgamating-chlorinating firms at Bendigo or Ballarat, and other centers of large fields, or have them treated at those establishments on account.

Commissioner Ogilvie's Opinion.

Regarding the Klondike this paper from the first has aimed to give the exact facts and to warn the inexperienced against believing the exaggerations so current. Experienced men need no admonition of the kind, but lured by sensational statements thousands of adventurers are rushing to their death.

Wm. Ogilvie, the Canadian dominion land surveyor, was recently interviewed, and, like others who have been there, gives a fair statement of facts. He says that more substantial home-takes have been taken out in "lays" on Bonanza and El Dorado during the past season than were taken out of all the Forty Mile, Sixty Mile and Birch Creek (Circle City) districts combined during the three best years. In this way all the other creeks tributary to Klondike, even branches of the Bonanza and El Dorado, were practically abandoned for the time being. All the rest of the Dawson district remained undeveloped, and as all the claims located in Canada have to be represented within twelve months from the date of their record, the claims on the other creeks will have to be developed or abandoned. Very few of them will be given up.

Bonanza creek joins the Troandike, commonly known as the Klondike, two miles above its mouth, Bear creek six miles above, Gold Bottom creek twelve or fourteen miles above and "Too Much Gold," thirty-five or forty miles above. Bonanza is about twenty miles in length and El Dorado, one of its branches, joining about midway of its length, is eight or nine miles in length. A claim is 500 feet in length, measured in the general direction of the stream. Bonanza thus furnishes upward of 200 claims, El Dorado about 80 and the several tributaries of these two will give nearly as many more—about 1500 claims in the valley of the Bonanza; 1000 of these may be worked with profit.

These 1000 claims will require 6000 men directly and indirectly for their proper development. We may safely assume that the other creeks mentioned tributary to the Troandike will furnish as many more claims—in all 2000. Of course, much depends upon whether the hillsides pan out as they have heretofore. If they do not, we can estimate that at least 1200 claims will be worked in the Troandike valley. Adjacent to the Troandike is the valley of the Indian creek. So convenient are the water systems to each other that it is only the labor of an hour or two to cross from one to the other. Indian creek, close to the head of Bonanza and El Dorado—two tributaries—has been prospected with fair success. We may assume, then, that considerable mining will be done on Indian creek, possibly as much as on the Troandike. This will give say 2500 claims, combined with Troandike diggings. Assuming the same ratio per claim as before, we require 15,000 men for the proper development of this area. The emporium for this will no doubt be the town of Dawson, situated about half a mile below the mouth of the Troandike. It cannot, in the nature of things, be seriously doubted that good paying quartz will be found in the vicinity of these placer claims, which will more than double the importance of this district. Several quartz claims have already been recorded.

The tops of the higher hills and ridges are devoid of vegetation except arctic mosses and lichens, but all the rest of the country is covered with a thick layer of moss, which again supports scrub spruce, some scrub white birch and a thick growth of northern shrubbery. This completely conceals the surface of the rocks, and to remove it to a sufficient extent to search for quartz prospects would entail a vast amount of labor—much more than the ordinary every-day prospector can afford. The cheapest and most expeditious methods of quartz prospecting here would be by diamond drill. A light portable machine of that description, a compact, light engine and boiler sufficient to work it could be easily made and set up at various points along the various creeks. From the cores thus obtained experts could readily determine what the probability and prospects were. This requires capital, but I have no doubt a company formed with this object in view—prospecting in this way—would find it a profitable investment. All the gold I have seen taken out of El Dorado and Bonanza—for that matter of other creeks, too—bears no evidence of having traveled any distance. I have seen no evidence of glaciation anywhere in that district. Whether it is concentrated enough to pay for the expense of quartz mining can only be determined by proper search.

Stewart river, sixty-five or seventy miles farther up, is about 400 miles in length; its tributary is easily double this. This gives in the neighborhood of 1000 miles of stream on which a great deal of surface prospecting has been done and fine gold found everywhere. Upward of 100 miles farther up, where the Pelly joins this, fine gold has been found.

This is an extensive area of vast possibilities. What it wants for its proper development is increased transportation facilities, with the certainty of sufficient food supplies to sustain the number of people required. At present and during the past a visit to the country entailed a long period of time and considerable expense and much uncertainty as to whether or not one can remain there more than a few weeks. With increased, quicker and cheaper ingress and egress, with a certainty of food, this part of Canada and Alaska will furnish employment to thousands. At present food is so expensive that ordinary, every-day diggings are entirely neglected. The food supply available at Dawson and to be laid down there this season will not much if any more than furnish the requirements of those now there. If the rumors concerning the number seeking access to the country is true, there will be much dearth of provisions. To make one's way out of that country during the winter to the nearest point where supplies are available, which is at Dyea or Juneau, is an arduous labor requiring about one month with a dog team for its completion; the people making this trip consume more food while doing so than they otherwise would. The dogs, too, consume a tremendous amount. The old adage that cure is worse than the disease is particularly applicable. If those on their way succeeded in reaching Dawson they will either have to make their way down the river at once and return to Seattle, or remain at Dawson and run the danger of starvation, unless they have brought in with them sufficient food for one year's use. Says Mr. Ogilvie: "I would emphatically warn all contemplating coming into this country for the betterment of their fortunes to come well prepared with provisions, clothing and miner's tools, with a few necessary carpenter's tools. In saying this I do not wish to be understood as at all reflecting upon the companies now trading there. They are making strenuous efforts to meet the new requirements, but the transition from two small mining camps to such a world-famous place as Dawson was so sudden that it found them for the purpose unprepared. Next year their freighting facilities will possibly treble that of this year, but even that will probably be found short. Then again, the ocean voyage from Seattle or San Francisco to St. Michael, and from St. Michael to Dawson, some 1600 miles, is long, tedious and expensive. More important still is the shortness of the time in which the route is available. Steamers seldom reach St. Michael before the end June, owing to the ice is Bering Sea, and captains of vessels care little about risking a voyage there after the middle of September, as storms are so violent and so shallow is Bearing Sea. From these causes it cannot be claimed that the route via St. Michael is available for more than three months in the year, July, August and September. The ice in the upper Yukon river breaks about the middle May. Generally about the 20th the river is clear enough for steamboat navigation. Ice begins to run again about the middle of October, so that we can count on nearly five months steamboat navigation in that river, as against three via St. Michael.

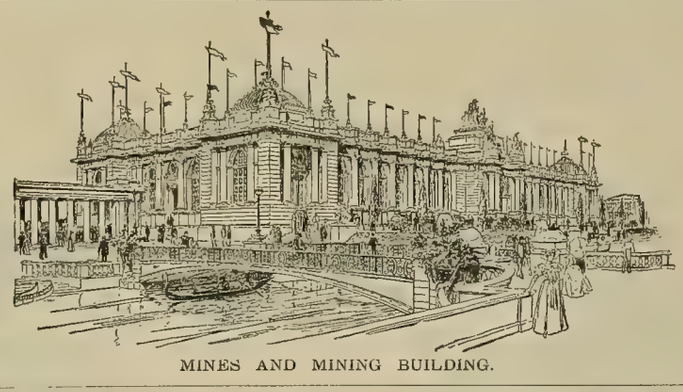
"Give us some easy continuous route for the south down the river to these points and we nearly double our available route for transport, and this, were there no difference, would be quite an item in the development of the country. But it will probably be found that the cost will be considerably reduced too. Of course the cost will be regulated considerably by the amount of demand, but give us the facilities and I believe the demand will rise and meet it more than half way. To those coming into the country contemplating getting a claim on Bonanza or El Dorado I would say do not think of it. As I said before both of these creeks were located last fall, and if you have money enough to purchase an interest in any of them you have money enough to remain where you are, possibly with as much benefit and assuredly with much more comfort to yourself. The rich claims which have given these two creeks world-wide fame aggregate about 130 in number. From these spring all the stories of fabulous wealth of this region, and these stories are largely true. But as far as I know up to the present time there is only one Bonanza and one El Dorado.

"The other creeks I have mentioned prospected very good, but, as I have already stated, they are practically undeveloped. That creeks as rich as these two will be found I can neither assert nor deny. That there is a very extensive gold-bearing area here, which will be an important factor in the world's supply of that metal for many years to come, I am positive. But I would solemnly adjure you to come prepared for serious and long-continued disappointment."

Transmississippi and International Exposition at Omaha, June to November, 1898.

The facade presents a frontage of 400 feet; height to top of main cornice, 40 feet; height of center pavilion to top of crowning group of statuary, 85 feet; end pavilion, 65 feet to top of dome; center entrance, 24x34 feet high.

The ceiling will be a large barrel vault, with intersecting cross-vault, richly coffered and elaborately decorated. On the walls it is proposed to have mural paintings emblematic of mining, placer working, packing of ores and other mining scenes.



MINES AND MINING BUILDING.

Prospecting IN THE Klondike.

If it is your intention to visit the new placer field of the Klondike region, the best possible preparation you can make is to take a course of instruction by mail in

Prospecting for Gold and Placer Mining.

Established 1890. Inquire of Bradstreet's or Dun's for the standing of The Colliery Engineer Company proprietors. Send for FREE CIRCULAR containing full particulars.

Three-Stamp Iron Frame Battery

WAS MADE BY THE

UNION IRON WORKS

FOR THE

NEVADA METALLURGICAL WORKS.

The stamps weigh 350 lbs.

The total weight of the battery is 5000 lbs.

The weight of the heaviest piece is 1300 lbs.

Capacity, five tons per day.

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS

was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891

the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials. The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The Improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

with one-half less power and occupying less than one-half

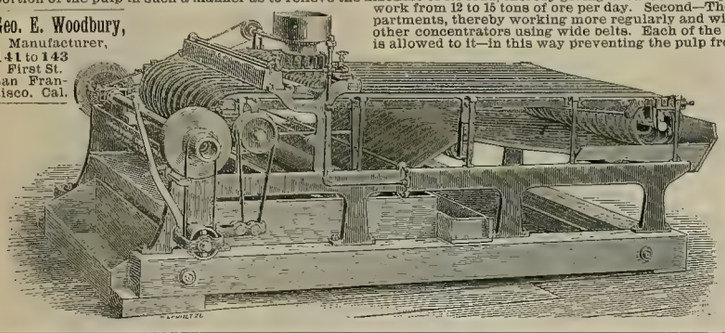
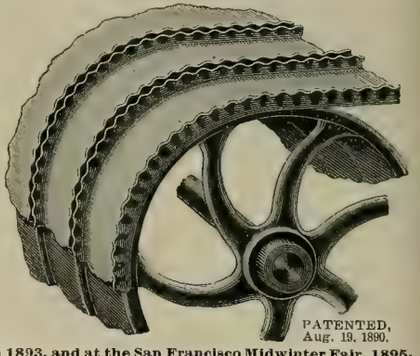
San Francisco. Cal.





PATENTED, Aug. 13, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892: it took the 1st, prize at the World's Columbian Exposition 1893, and at the San Francisco Midwinter Fair, 1895.

THE GUTTA PERCHA AND RUBBER M'F'G CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

NOTICE TO ORE SHIPPERS.

By shipping your ores to us you can obtain the highest prices paid on competitive bids in the public market, together with a careful and accurate sample, as with our new mill and improved machinery we are able to give perfect satisfaction to all shippers. *Write for our Pocket Reference Book.* The highest cash price paid for gold bullion and old gold. Prompt returns.

STATE ORE SAMPLING COMPANY, Denver, Colo.

Coast Industrial Notes.

—Washington State has a population of 350,000.

—Fruit is now shipped from Sacramento, Cal., to London in fourteen days.

—The $2,175,000 in gold which came from Australia, and the $2,350,000 in gold now on the way from Melbourne is to pay for California wheat.

—Since Jan. 1, '97, 1000 mules have been shipped from California to Hawaii for use on the plantations and as many horses from northern ports to the Klondike.

—Oil in Los Angeles now sells at 60 cents a barrel. A producers' pool is mooted to sell the large surplus in San Francisco, including storage tanks of 150,000 barrels capacity.

—The San Francisco *Call*, under its new management, displays considerable nerve in opposing a project for another San Francisco park. The *Call* is right, and is to be commended for its advocacy of true public interests.

—The forty-fourth annual California State Fair begins at Sacramento next Monday and continues till the 18th inst. Electric power, space and light are furnished free to exhibitors of mining machinery, and a large attendance is probable.

—The Elizabeth, a steel steamer built for the Pacific Mail Steamship Company, was launched at the Union Iron Works last Thursday. She is built for the water service of the company at Panama, where, on account of the insufficient harbor facilities, vessels have to anchor some distance from the shore.

—Consul Robertson at Hamburg has sent to the State Department a letter addressed by him to the California Commissioner to the Hamburg Exposition, stating that an exceptional demand exists for California products, and urging that a permanent California exhibit be established at Hamburg and other European cities.

—An English engineer is at Phœnix, Arizona, to make an examination of the Verde canal project and report to English capitalists, who will invest in the enterprise if the report is favorable. The Minnesota & Arizona Construction Company, S. R. H. Robinson manager, have already expended about $150,000 on the enterprise.

—Japan is importing cheap laborers from Korea to work in her coal mines. Five years ago the wages of carpenters were 33 cents a day. Now they advertise that their wages have risen to 80 cents a day—40 cents in United States currency. The cost of living has nearly doubled in five years and the cost of labor has risen in proportion. Rice in 1890 was $4 90 a koku; to-day it is $8 90 to $9.10—about $4 50.

—General Shafter, commanding the Department of California, U. S. A., has been directed by the Secretary of War to station troops at Lime Point to man the three 12-inch breech-loading rifles recently placed in position. The battery at Lime Point is regarded as one of the most formidable in the United States. It is on the bluff, 490 feet above the water, and commands an ocean range of ten miles. Each gun throws a solid steel projectile weighing 1,000 pounds.

—The wheat blockade in the interior of California is being transferred to the San Francisco water front. The seawall is packed, but steamers continue to arrive with heavy cargoes of grain. The ships that are to take the wheat to Europe cannot be loaded at the seawall fast enough, and some of them have taken berths along the front and other available places. The result is that every wharf is crowded and ships are lying in the bay because they cannot get a berth at a wharf.

—The live stock interests of California are looking up, prices are better than they have been for years in Modoc, Lassen, Shasta and Siskiyou, the principal grazing counties of the northern portion of the State. Eastern buyers are in the market and 15,000 head of cattle have been shipped from these counties within a few months past, mostly to Kansas City, via Reno. The prices realized are from $5 to $12 a head more than they would have brought a year ago. Calves now fetch from $5 to $6, yearlings about $12 and two-year-olds $18 to $22. These are for beef grades.

—E. W. Nelson, in a report on the meteorology of St. Michaels and vicinity, gives some information about the seasons on the Yukon river. During the first four years of his residence there, he says, the first mush ice has begun to form in the bays from the 15th to the 18th of October, and the bays have been frozen over so as to bear up a man from the 25th to the 28th of October. Up to the 15th of October vessels can enter without fear of meeting the ice. In the spring much more uncertainty exists, as to a great extent the depth of open water depends on the nature of the winds. Long-continued north winds following a severe winter, as in 1880, may keep the ice barrier in until the 20th of June, and it has even remained until near the 1st of July. But these late dates are exceptional. As a rule, the ice will be thoroughly broken up and a strong vessel may enter Norton sound, the mouth of the Yukon, by the 10th of June. There is usually but little risk in entering the ice at that season.

—R. C. Johnston, who discovered the lake of oil in Alaska a year ago, writes to his brother in National City, Cal.: "I had fair luck washing the beach sand. The water we used from a creek contained oil, and bothered us in saving the gold with quicksilver, which we had to use, so I concluded I would try and find the oil. After a few days' search, I saw it was an oil country and after six weeks' hard rustling I found a very large flow of about twenty springs running into a lake 300 by 120 feet in size, which makes quite a pond. A man can dip up fifty barrels per day with a bucket. It is the best lubricating oil that has ever been found. We are offered $4 a barrel for all we can land at Seattle. I have no desire to go to Klondike or Yukon at all, as I have a better thing than three Klondikes, which I can go to in seven days from San Francisco. Our company will ship 30,000 feet of pipe and tanks that will hold 100,000 barrels of oil, and all necessary supplies to operate both the oil and coal fields."

—As late as the middle of July the Mexican silver dollar was worth 48 cents in gold. Then gold was at a premium of 108 per cent in Mexico, and a draft on New York for $100 cost $208 in Mexico. Then it cost the Mexican importer $208 to pay for a bill of $100 of goods bought in New York. At this date the Mexican dollar is worth but 40 cents in gold, and a draft to settle a bill for $100 of goods in New York costs the Mexican importer $250. In other words, the cost to the Mexican importer of everything bought from gold using countries has been increased 20 per cent by the recent fall in silver. He has had to mark up the price of all imported articles by 20 per cent, and this has made a great opportunity for the Mexican manufacturer. The fall in silver since the middle of July has been equivalent to an increase of the tariff by 20 per cent to the Mexican manufacturer. Naturally, manufacturing in Mexico has been stimulated.

Recent California Mining Incorporations.

Rodman-Morrell M. & M. Co., San Jose; R. H. Rodman, F. F. Johnston, G. P. Burkett, C. H. Nash; capital stock, $100,000; subscribed, $51,000.

Oro Fino Company, San Francisco; G. H. Pettis, W. Schilling, J. H. Rawe, J. E. Lee, G. O. Dean, all of San Francisco; capital stock, $10,000; subscribed, $2100.

Marian G. M. Co., Berkeley; A. D. Glace, E. J. Stewart, H. B. Sharps, D. J. Greger; capital stock, $150,000; subscribed, $250.

E. M. Co., Eureka, Cal.; S. B. Foster, R. C. Rose, A. A. Redmond, J. O'Neill, A. T. Crane; capital stock, $350,000; subscribed, $32,000.

Topeka G. M. Co., Los Angeles, Cal.; H. T. Gage, J. Gilbert, E. B. Millar, H. O. Collins, J. Schoder, S. M. White, R. B. Carpenter, G. J. Denis; capital stock, $240,000; all subscribed.

Red Room G. M. Co., Los Angeles, Cal.; same as above; capital stock, $1,200,000; all subscribed.

Cochabamba M. Co., San Francisco; G. W. Silver, G. W. Platt, C. H. Spinks, M. McKenzie; capital stock, $500,000; all subscribed.

Eagle Oil and Mining Co., San Francisco; W. S. Duncombe, A. W. Craig, B. S. Spencer, J. A. Armitage, B. E. Loomis; capital stock, $100,000; $1000 subscribed.

Innis G. M. Co., Oakland, Cal.; J. C. Matthews, R. McKillican, W. A. Fine, F. M. Farwell, J. P. Bandin; capital stock, $60,000; $6000 subscribed.

Consolidated Superior M. Co., San Francisco; D. L. Munson, W. F. Howe, R. H. Webster, E. W. Thomas, W. D. Evans, C. A. Murdock, N. J. Manson; capital stock, $1,000,000; subscribed, $17,000.

Gold Standard G. M. Co., San Francisco; J. M. Kaufman, E. Schmidt, L. Schenck, A. P. Davis, H. S. Smith; capital stock, $50,000; subscribed, $25,000.

Mohawk-Acton M. Co., Los Angeles; O. W. Roberts, E. D. Brown, G. B. Katzenstein, P. McCabe, M. V. Hartranft, T. Summerland; capital stock, $1,000,000.

Commercial Paragraphs.

THE Pacific Rolling Mill Co. has moved its office from 100 Market street to the corner of First and Mission streets in the Union block.

THE Colorado Iron Works Co., Denver, Colo., reports the shipment of a carload of mining machinery to the Midnight Mining Co., Vasquez, New Mexico.

THE cities of New York and Boston are trying to keep abreast of the times in the matter of mail transportation, and both are hurrying forward the completion of the pneumatic tube conduits that form part of the Batcheller rapid postal dispatch system which they have adopted. To operate the system New York is to have two air compressors with steam cylinders of 13 inches diameter and air cylinders 26 inches diameter by 20 inches stroke, and one compressor with cylinders 10 and 24 inches diameter, respectively steam and air, by 20 inches stroke. Boston is to have two air compressors of the latter size. All five are to be "duplex," and the Rand Drill Co. of 100 Broadway, New York, has the contract for making them.

THE Jeffrey Manufacturing Company of Columbus, Ohio, manufacturers of coal mining machinery and other specialties, have just received a letter from Mr. S. W. Farnham, mechanical engineer of the Coal Companies of St. Louis, enclosing a report from Mr. James Cameron, superintendent of their No. 2 Western Coal and Mining Company's mine, located in Arkansas. In this report Mr. Cameron states that at their mine, with a Jeffrey electric machine equipped with self-propelling truck, they were able on the 13th of this month (August) to make ninety-five cuts in nine and one-half hours. This record was made by two of their men, all cuts being made with the same machine. This work was done in five rooms and two entries and necessitated the changing of bits a number of times. It was necessary to load and unload the machine seven times. This run beats any record that has ever been made in their mine and up to this date there has never been a report from any mine in the United States of such a record. There have been records made by other machines when several separate machines were set ready to do the work and the number of cuts made by all machines counted, having only one set of men to move quickly from one machine to another and thus save loss of time incident to moving machine from room to room or one entry to another. There seems to be no limit to the amount of work that the Jeffrey chain machine can perform, as on account of strength of its construction and capacity of motor it has been able to keep far in the lead.

Personal.

ARTHUR L. PEARSE of London is in Cripple Creek en route to San Francisco.

T. A. BENNETT AND C. M. ROLKER are examining the Dexter, Utah, property.

R. T. FARNSWORTH has resigned the management of the Mammoth, Utah, mine.

GEO. E. AMES of the Union Iron Works has returned from a protracted sojourn in Montana.

ROSS E. BROWNE is examining the Hydraulic Mining Co.'s property at Minersville, Trinity Co., Cal.

DR. P. LANGHAMMER is now in charge of the Quintette G. M. Co., Oroville, Okanogan Co., Wash.

M. O'ROURKE of Marysville, Mont., is the new superintendent of the Sioux mill, Mammoth, Utah.

O. B. HARDY has organized the Boston & Nevada Copper Co., to work the property at Yerington, Nevada.

J. N. WALKER of Everett, Wash., is to be superintendent and metallurgist of the Pilot Bay, B. C., smelter.

HERBERT VISCHER, assistant to the Debris Commission, is examining Plumas county mines, his present headquarters being Quincy.

MR. LOUIS GLASS, assistant general manager of the Pacific Telephone & Telegraph Company, has returned to San Francisco from New York.

M. CURRAN is again superintendent of the Gold Hunter M. Co., at Mullan, Idaho. It is understood that a new mill will be built this fall to replace the one recently destroyed by fire.

I. B. HAMMOND of Portland, Or., is on his twentieth trip to Alaska. He is going prospecting to investigate the feasibility of putting dredgers on the Yukon and tributaries to hoist up gold.

C. K. BANNISTER has been appointed chief engineer of the Union Light & Power Company, which recently absorbed nearly all of the electric power companies in Utah, including the Pioneer Power Company.

C. S. HERZIG, mining engineer, who some months ago left for South America to accept a position as engineer with the Playa de Oro Mining Company in Ecuador, has returned to the United States on account of ill health.

BYRON E. JANES of the University of California returned last Wednesday from Dawson City. Mr. Janes' letters to the MINING AND SCIENTIFIC PRESS from the Klondike were the first authentic published accounts of that region. His last letter was sent from there under date of June 22nd, '97. Mr. Janes left there July 17th on the steamer Alice, transferring at St. Michaels to the schooner J. M. Colman, arriving at Port Townsend, Wash., on the 30th ult., thence to San Francisco by rail. He came down to complete his scientific mining course with Prof. Christy at the State University at Berkeley, Cal., and subsequently contemplates return to the Klondike. He anticipates considerable distress there this winter.

HO! FOR ALASKA'S GOLD FIELDS!

Greatest gold fields on earth. We have just published a complete guide to Alaska fully describing all her rich gold fields, telling how to get there, cost of trip, routes, etc., also mining laws. Fully illustrated; only reliable book. Facts and views secured by special correspondents right on the ground. Post yourself by securing "inside" information ahead of the crowd. For the present we will send a book free to anyone sending us 25c postage for a 3 month's trial to our big illustrated weekly family paper. Clubs of 5 and 5 books, $1. Agents send 25c for sample. Mention THE PRESS. *Weekly Sentinel*, Denver, Colo.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from E. H. Adams, in the King Bird Mine, in Yuba Co., near Clipper Mills, to deposit tailings in Grizzly Creek; from J. T. Coffman and George T. Miller, in the Lost Camp Mine, near Blue Canyon, Placer Co., to deposit tailings in Blue Canyon, and from Mrs. E. A. Cox, in the Washington Mine, in Whisky Diggings, Sierra Co., to deposit tailings in Slate Creek, gives notice that a meeting will be held at room 59, Flood Building, San Francisco, Cal., on September 7, 1897, at 1:30 P. M.

Recently Declared Mining Dividends.

Moon-Anchor G. M. Co., Colorado, 2 cents per share, $12,000; Sept. 1st.

Elkton Con. M. & M. Co., Colorado, 2 cents per share, $20,000; Aug. 20th.

Ætna Con. Quicksilver Co., Cal., 10 cents per share, $10,000; payable Sept. 10th. The seven months' statement shows: Gross earnings Jan. 1st to Aug. 1st, $73,500; expenses, $37,830; net, $35,669.

New Idria Quicksilver Co., Cal., dividend No. 2 of 10 cents per share, $10,000; September 1st. The three months' statement of the company shows: Gross earnings May 1st to Aug. 1st, $37,625; expenses, $20,358; net, $17,265.

Pennsylvania, Nevada Co., Cal., 5 cents per share, $2575; Aug. 30.

Fortuna G. M. Co., 10 cents per share; Aug 30.

Morning Star, Placer Co., Cal., No. 81, $5 per share; payable immediately.

Books Received.

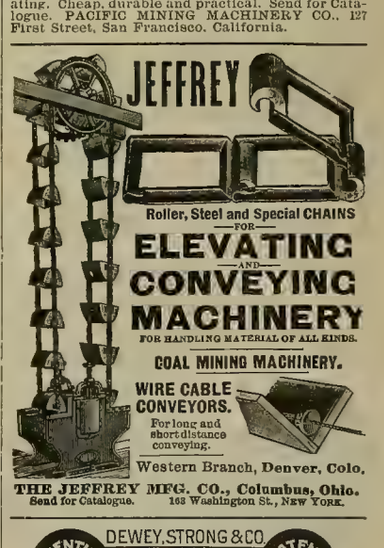
"*The Mining Laws of the State of California from '47 to '97*," by F. Hall, sold by J. Bell, Los Angeles, Cal., price 25 cents, postpaid; a handy compilation of State statutes.

"*Practical Mining and Assaying*," by Frederic Milton Johnson of San Francisco, sold by Hartwell, Mitchell & Willis, 107 Montgomery street, San Francisco, price $1; a practical book by a practical man for the prospector and miner, in compact shape and conveniently arranged.

PACIFIC AMALGAMATOR

FOR QUARTZ MILLS, Placer & Beach Sands.

Takes the place of plates. Will save the fine as well as the coarse gold. It has a large silver-plated amalgamating surface, constructed so as to produce a complete contact. Will save fine gold that cannot be saved on ordinary plates. No extra cost of operating. Cheap, durable and practical. Send for Catalogue. PACIFIC MINING MACHINERY CO., 127 First Street, San Francisco, California.



Western Branch, Denver, Colo.

THE JEFFREY MFG. CO., Columbus, Ohio.
Send for Catalogue. 163 Washington St., NEW YORK.

Assaying.—Part I—Gold and Silver Ores.

Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid..... .....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Notes on Assaying and Assay Schemes.

By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

Prospector's Field Book and Guide.

By H. S. Osborn.....$1 50

A Practical Guide for Prospectors and Miners.

By C. W. Moore. With numerous illustrations.....$4 75

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.

With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Modern Copper Smelting.

By Edward Dyer Peters, Jr. Seventh edition. Rewritten and enlarged. Profusely illustrated....$5 00

Electricity in Mining.

By Sylvanus P. Thompson..... 80 cts.

Practical Treatise on Hydraulic Mining.

By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc Price, postpaid.....$5 00

Practical Hydraulics.

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Metallurgy of Silver.

By M. Eissler. Profusely illustrated.....$4 00

The Explorer's and Assayers' Companion.

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

Aaron's Leaching Gold and Silver Ores.

By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid.....$3 00

Manual of Assaying—Gold, Silver, Copper and Lead Ores.

By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 533 pp. Price, postpaid.....$2 50

The Metallurgy of Gold.

By M. Eissler. Profusely illustrated.....$5 00

A Text Book of Mineralogy.

Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

Notes on the Treatment of Gold Ores.

By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

A Practical Manual of Minerals, Mines and Mining.

By H. S. Osborn.....$4 50

Cyanide Processes for Gold and Silver Ores.

By E. B. Wilson, E. M. 12mo., cloth.....$1 50

By P. M. Randall.....$2 00

Assayer's Guide.

By Oscar M. Lieber.....$1 50

Assayer's Manual.

By Bruno Kerl. Illustrated.....$3 00

Metallurgy of Silver, Gold and Mercury in the United States.

Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo.....$7 00

Metallurgy of Silver, Gold and Mercury—Continued.

Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth.....$7 50

Manual of Determinative Mineralogy.

With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth...$3 50

Skeleton Mining Report.

Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid....50 cts.

Stamp Milling of Gold Ores.

By T. A. Rickards, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid.....$2 50

Miners' Pocketbook.

A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. Warnford Lock. 472 pages, illustrated, flexible leather.....$5 00

IMPROVED PORTABLE HOISTING ENGINES.

Improved Self-Contained Three or Five Stamp Mill,

Saves bill for heavy timbers, millwright and mechanics' labor, and a large amount of space. The term self-contained means a great deal for the mine owner, and can be readily recognized and appreciated in making an estimate for an ordinary plant when the comparative cost is considered.

FIRST: There is saved a large bill for heavy timbers, in many instances obtained at great expense and loss of time.

SECOND: The saving in millwright and mechanics labor in framing and erecting.

THIRD: The large amount of space saved.

FOURTH: The great saving of freight,

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

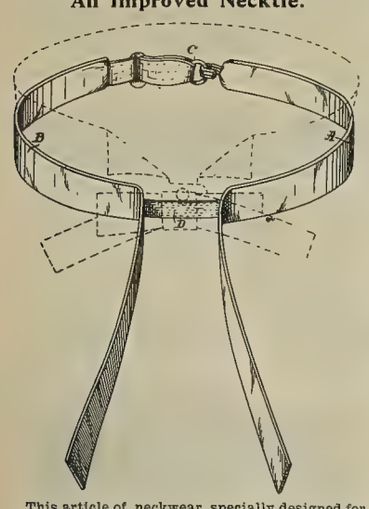
Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ELECTRIC CONNECTION BETWEEN RAILWAY RAILS.—Ford Marsellis, Peralta, Cal., assignor of one-half to Wm. W. Slater of Oakland, Cal. No. 588,771. Dated Aug. 24, 1897. This invention relates to a device for providing an electric connection between railway rails. It consists of a curved elastic plate having the ends bent to one side and adapted to engage and make a metallic connection with the abutting rail ends and in a means for clamping and securing the plate in place. These plates are made segmental longitudinally and also concave-convex and have angular projections which contact with the ribs of the rails. They are laid across the joint, and the fish-plates by which the rails are united are bolted over them so as to clamp them securely in place. This construction maintains a bright metallic connection at all times, so that the conductive power of the rails is not diminished.

CAN.—A. W. Livingston, San Jose, Cal. No. 588,800. Dated Aug. 24, 1897. This invention relates to improvements in the construction of hermetically sealing containing vessels. It consists essentially in forming a can with depressions upon opposite sides and with a surface formed upon its upper edge. The cover has a corresponding opposing surface and a gasket is adapted to be compressed between these surfaces to form an air-tight joint and to be maintained in place between the upper and lower flanges of the cover. An elastic clamp is so constructed as to press upon the cover to retain the surfaces in contact, this clamp having a concave central portion resting upon the cover, and the opposite ends extend down upon opposite sides of the can and are provided with inwardly projecting lugs which engage with side depressions of the can.

ADVERTISING VEHICLES.—C. S. Stafford, San Francisco, Cal., assignor of one-third to Thomas Leach, same place. No. 588,783. Dated Aug. 24, 1897. This invention relates to advertising vehicles and its object is to provide a wagon or vehicle with movable flexible sides or surfaces and a mechanism interposed between these and the wheels of the wagon, so that the rotation of the latter will advance the movable surfaces periodically and intermittently. The structure is mounted upon bearing wheels and has a series of parallel rollers journaled at top and bottom. An endless band or surface containing the advertisements passes about said rollers, and a gear or mechanism is so devised as to connect the lower rollers in series to rotate in unison, and this gear mechanism is connected directly with the driving shaft by means of mutilated gears, which serve to rotate the mechanism and advance the advertising surfaces periodically so as to expose new advertisements and allow them to remain in view for a certain length of time, after which they are again advanced.

An Improved Necktie.



This article of neckwear, specially designed for ladies' or gentlemen's use, is the invention of C. W. T. Davies of this city. It consists essentially of a center piece, two side pieces secured thereto, said side pieces extending rearwardly from the center piece to form a back band and also extending forwardly from the said piece to form the tying portion or means for the attachment of the tie and a separable attaching means for connecting the free ends of the rear extensions, or, if preferred, if the tie is permanently made up, one end of the center piece may be so arranged as to connect and disconnect. The device serves to keep the tie well in place about the collar, to hold it up in front, and also prevents it slipping up or down with relation to the collar. The ends of the tie being loose, a bow-knot, an Ascot, or any other form of tie, can be readily made, which cannot be done with the old style of necktie. Mr. Davies has assigned all his interest in the patent for this tie to the Hand-Tied Tie Co., of 238 Montgomery St., S. F.

WANTED.—A Second-Hand 5 OR 10 STAMP MILL.
Address, stating particulars, price, etc., A. B. this office.

MINERS, ATTENTION!

We beg to call attention to our RISDON HAMMERED PROJECTILE STEEL SHOES AND DIES, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density.

These Shoes will outlast any other make and will not chip or cup.

We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.

Our prices are as low as any, and the article we offer should commend it to all mine owners and mill men.

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 2, 1897.

General trade shows a continued enlargement, with individual buying in excess of purchases at the corresponding time last year. The growing feeling of confidence is promoting more disposition to operate on larger lines than at any time since 1893—the panic year. This feeling of increasing confidence is due to high prices ruling for farm and orchard products, with farmers having a net profit instead of a loss. It is the belief that, at present prices, the large majority of farms will be cleared of mortgages and payments made, so as to make it lighter in the future. Lower inland transportation to all points reached by water and the San Joaquin Valley railway, makes it possible for producers to market their products at a considerable reduction on former charges. The gold mining industry continues to forge ahead, but silver mining is going back, owing to the low and declining price of the white metal. Machine shops and iron foundries are doing a good business, with the outlook favorable for increased orders for next year. These orders will be for structural and other material and also mining machinery.

The local money market is reported to be more active for crop moving purposes, but owing to the liberal supplies held and the trade generally easy the rates of interest do not stiffen. It is now conceded that the advance in farm products will add from $2,000,000 to $3,000,000 to farmers' receipts in excess of what would have been received had the market kept down to where it was three or four months ago. The gold mines in this State alone are adding from $1,500,000 to $2,000,000 a month to the general circulation. Heavy importing of sovereigns from Australia in the nature of exchange is calculated to add still greater ease to the market; £450,000 have already come and £600,000 is on the way with other shipments to follow. Our New York correspondent writes:

The money market is puzzling the bankers very much owing to its failure to respond to the improvement in business. Everybody seems to be flush of money just now, and to need little or none. Shipments of currency to the west by certain banks have been fairly large this week, but on the other hand shipments of currency to the south have fallen off materially. Demand for time money is nothing like as good as it was, and rates have yielded decidedly from the best, and it is also noted that commercial paper is decreasing in supply. The effect of this is, that the surplus of loanable funds continues very large, and it is impossible to get rates up. No doubt the explanation is to be found in the fact that the long liquidation of the last few years has left everybody free of debt to an unprecedented extent. Hence, the fact that improvement in business has failed to cause the borrowing of very much money.

New York Silver Prices.

NEW YORK, Sept. 2. — Following are the closing prices for the week:

	Silver in—	
	London.	N. Y.
Friday	23⅞	51¼
Saturday	24	52
Monday	24⅛	52½
Tuesday	24	51¾
Wednesday	23¾	51¼
Thursday	23¾	51⅜

Refined Silver, per oz., 1000 fine	51⅝
Mexican Dollars, nominal at	41

SILVER.—The market continues demoralized, with no buying except on order. The metal does not seem to have a friend, and therefore it is singular that the price does not sink still lower. The advance in lead helps it some, but not enough to keep mines from shutting down. One report was out that India would increase the import duty on silver, and a still later one is that no more Council bills will be put on the market for several months. But why this should be accepted against silver is more than we can tell, for before these bills were a factor the price of silver was quite higher and it was wanted for remitting, but since the bills have been put on they have been used to a considerable extent. If India's wheat crop turns out large, then silver will be wanted for exchange.

QUICKSILVER. — The market is barely steady. The last steamer for Mexico took out 120 flasks.

Our market is quoted at $38 for domestic consumption.

MEXICAN DOLLARS.—There has been fair buying, but at irregular prices. Bullion dealers do not carry much in stock, owing to the unsettled market for silver.

COPPER.—The market has ruled steady. The East continues to report a good export and home demand.

Our market is quoted as follows:

Ingot casting, jobbing	13@—
Ingot " wholesale	12½@—
Sheet copper	—@16½
Bolt ¾ and 5-16, 20c; ⅜ and larger,	16½

TIN.—The market is easy.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

LEAD.—The market has firmed up in sympathy with the East, where quite an advance has taken place.

Our market is quoted in jobbing lots as follows per 100 pounds:

Pig	5 00 @	5 25
Sheet	6 25 @	6 50
Pipe	5 50 @	6 00

SHOT.—The market is firm.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 40
Drop, B and larger sizes, " "	1 65
Buck, Balls and Chilled, do, " "	1 65

POWDER.—The market is active, but not quotably higher.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

COAL.—There is an improving demand for steam and domestic. The near approach of winter months is causing more inquiry for the latter. Another vessel will leave soon for Cook's Inlet to load coal for the North Pacific Mining & Transportation Company.

We quote as follows:

SPOT FROM YARD—PER TON.

Wellington	$8 00@— —
Greta	6 00@ 6 50

Salisbury	29 00	31 50

ENGLISH.

Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

ANTIMONY.—The market is steady.

Our market is quoted at 8¼c in a jobbing way. New York mail advices quote 7¾c for Cookson's, 7¼c for Hallett's and 7c for Japanese.

NAILS.—The market is higher and strong.

Wire, carloads, basis per keg	....
" jobbing, " "	$2 35
Cut, carloads, " "	....
" jobbing, " "	2 25

BORAX.—The market is steady.

The market is quoted as follows:

Refined, in carload lots, in barrels	5
Refined, in carload lots in sacks	4¾
Powdered, in car lots	5
Concentrated, "	4¼

PLATINUM.—The market is quiet.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

ZINC.—The market is steady.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

Chemicals.

The market is not in the most satisfactory condition, for jobbers are still shading several articles below what it would cost now to import at. The East is in a similar condition, as the following from a leading New York exchange shows: "The entire market remains in a quiet condition and prices are momentarily at a standstill, but light cuts on manufacturers' prices are being made quietly from second hands.

SULPHURIC ACID.—The demand is light. We quote in a jobbing way at 1¾c per lb for 66%.

ACETIC ACID.—The market is firm at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported steady from store at 6½@7c per pound in carboys.

BLUE VITRIOL.—Our market is barely steady.

We quote in a jobbing way at 4½c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is firm.

Our market is quoted in a jobbing way at $1.50 a pound.

BONEASH.—The demand is fair.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

PHOSPHORUS.—The market is firm.

We quote in a jobbing way at 70 to 75 cents per pound.

SODA ASH, 58% (LeBlanc process).—The market is firm at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steady at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—There is a fair demand at 2½c a pound from stores.

NITRATE OF SODA.—Thomson Aikman, Jr., London, states that the estimate of shipments nitrate of soda in August is 79,000 tons to Europe and 9,000 to United States, with about 48,000 tons now loading for September dispatch. Last year shipments in August were 101,000 and 13,000, and loading 1st September, 105,000 and 2,000 tons. The production in July shows a falling off of about 20 per cent on that of June. The market has become firmer.

Our market is quoted from store at 4c for 95%.

Mining Share Market.

SAN FRANCISCO, Sept. 2, 1897.

The market moved to higher figures the past week, with Occidental showing the most strength. It is stated that a pool has been formed in Occidental and that still better figures are looked for. The advance has been already very good—moving from below 10 cents a share to $1.40 a share. When the upmove was first started 60 cents and $1 were the figures put out to sell at. A large number sold at 60 cents—some even shorted—and when $1 was reached more sold, but there is considerable still held on the outside. It ought to be in order to soon report good strikes of ore and that dividends are in sight, so as to help the pool to unload on bull points of the shares going to much higher figures. The upmove in the Comstock shares has been the most marked in the shares that have been kicked about for over a year or two past with the life assessed out of them. This has admitted of concentration, and whenever this occurs neglected work is started and the street filled with all kinds of bull points. But it must be admitted that the market has been too low for several; yet if the shares are not well in hand even at 10 cents or less they are high unless bought after a drag and buyers are willing to pay assessments when they come along, for sooner or later they will get out at a good profit. The advance in Utah is due to the starting of a crossdrift and that some ore will be struck, provided the public do not buy too many shares. The work in the joint west workings of Yellow Jacket, Crown Point and Kentuck ought to gain in interest. Con. Imperial has strengthened some. They ought to be near the west ledge, which has evidently dipped to the west. The lawsuit brought by Justice, terminating in the company's favor, admits of work where the jumpers left off. The latter made the ore pay, but whether the Justice Company will remains to be seen. Assessments are the order. Cholar wants more money, for the company has been milling ore and the mill company does not work for glory. Several other companies are said to be in the same box, but the majority do not report milling ore, but report work in the mines. Even this costs money, and when added to office and other expenses aggregate a considerable sum.

From the Comstock mines the news, officially, so far made public, is rather bearish which is accepted by older traders as favorable for an upmove before long, yet before setting in on a bull campaign lower prices are not improbable. Heretofore all bull campaigns have been started when advices from the mines did not warrant it and in several instances when other conditions seemed unfavorable. A down market is made on big ore strikes and when everything would seem to justify expecting a big bull campaign. It is the unexpected and not the expected which seems to govern the mining share market. From Utah private advices state that a crossdrift has been started, but the official letter only reports continued work in the north drift. No change is reported in Union, either in the work or material encountered. The Sierra Nevada letter is as barren of good news as a desert of springs of water. The work is still confined to the 900-foot and Layton tunnel levels. This may all change after awhile provided the shares are better concentrated. In Mexican they are still pegging away on the 1000-foot with nothing reported as yet that is calculated to encourage assessment paying. In Ophir they are still going west on the 1000-foot level while on the central tunnel level they are going south. In Con. Virginia the work is confined to the 1550-foot and 1650-foot levels. The work on these levels is practically the same as reported last week. The ore found is of two low a grade to extract and mill. The final result of a test milling of some low grade ore at the Kinkead mill has not been reported so far as we are advised. No change is reported in Best & Belcher and Gould & Curry work. In Savage fair work is being done on the level heretofore reported. Considerable repair work is being done in Potosi which indicates that more active work is in contemplation this month, probably to collect an assessment. It is reported that new work is to be started in Andes. The absence of news from Bullion looks as if some one is after the shares. From Con. Imperial, Confidence and Challenge nothing new comes to hand. The same can be said of Yellow Jacket, Kentuck, Crown Point, Belcher, Seg. Belcher and Overman. The work in these mines looks as if something better ought to be looked for before long in at least one of them.

From the Brunswick lode our advices state that active exploiting is being done, with fair to good results looked for, judging from present prospects in the different mines. The joint work of Gould & Curry, Best & Belcher and Con. Virginia is confined to the 300-foot and 600-foot levels. On the 300-foot they are doing some exploiting work, while on the 600-

WE are exclusive handlers of Automatic Acetylene Gas Generators for Northern and Central California. We are desirous of establishing responsible agencies for our territory. Correspondence solicited. WESTERN ACETYLENE GAS CO., Room 75, 916 Market Street, San Francisco.

Working Capital for Mines.

PACIFIC EXPLORATION COMPANY

Will form companies and find capital to develop mines on shares or commission. Miners who have a good prospect should write the manager of this company for particulars. Address W. E. HOLBROOK, Manager, 29-30 Chronicle Building, S. F.

WILL NEGOTIATE with owners or their duly authorized agents only.

WILL INVESTIGATE only thoroughly bonafide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

For information, address
C. F. ELLIOTT, General Traffic Agent,
DENVER, COLO.

foot level they are running both north and south.

In Occidental they ought to be ready to start a crossdrift on the 650-foot level. This may be delayed until connection is made with the 550-foot level. On the 550-foot the east crossdrift is out over 800 feet. In Chollar they are exploiting and stoping on the 300-foot and 400-foot levels. On the 600-foot level they will be soon far enough in to start to crossdrift for the downward continuation of the ore found above. They have commenced milling ore.

Occidental sold at the 2:30 session at $1.80, with buyers at the same figure. Savage advanced under buying on reports of an improvement on the Brunswick lode. A 20-cent assessment was levied by the company to-day. A 20-cent assessment was levied yesterday by Chollar and a 10-cent one by Andes. It is the belief that the market will do better when all the assessments are levied.

The following illustrates the changes of the week:

A New Mexican Opinion.

No man interested in the mining industry can afford to be without the MINING AND SCIENTIFIC PRESS, published in San Francisco. This is the oldest mining journal on the American continent, and its reputation for absolute reliability was established long ago. In mining news and scientific progress it always keeps abreast of the times. It is by all odds the best mining journal published in America, and only by a weekly perusal of it can a man hope to keep up with the great and growing industry of which it is the leading exponent in this country.—*Editorial in the leading paper of New Mexico, the Santa Fe New Mexican, issue of Aug. 25.*

Assaying Gold
AND
Silver Ores.

By C. H. AARON.

A Standard Work.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Perface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press**, 330 Market St., San Francisco.

Assessment Notices.

OSBORN HILL GOLD MINING AND MILLING Company.—Location of principal place of business, San Francisco, California; location of works, Grass Valley, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 4th day of August, 1897, an assessment (No. 6) of 35 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, room 11, No. 331 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of September, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 27th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

R. R. GRAYSON, Secretary.

Office—Room 11, No. 331 Pine street, San Francisco, California.

CONSOLIDATED CALIFORNIA AND VIRGINIA Mining Company.—Location of principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 3d day of August, 1897, an assessment (No. 9) of 25 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, room 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 8th day of September, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 29th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

A. W. HAVENS, Secretary.

Office—Room 29, Nevada block, No. 309 Montgomery street, San Francisco, California.

OCCIDENTAL CONSOLIDATED MINING Company.—Location of principal place of business, San Francisco, California; location of works, Silver Star Mining District, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors held on the 3d day of August, 1897, an assessment (No. 28) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 7th day of September, 1897, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on THURSDAY, the 30th day of September, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

ALFRED K. DUREROW, Secretary.

Office—Room No. 69, Nevada block, No. 309 Montgomery street, San Francisco, California.

GOLD RIDGE CONSOLIDATED MINING AND Milling Company.—Location of principal place of business, San Francisco, California; location of works, Nevada and Sierra Counties, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 3rd day of August, 1897, an assessment (No. 5) of 4 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, rooms 12 and 13, No. 43 Sixth street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of September, 1897, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 9th day of October, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

H. SYLVESTER, Secretary.

Office—Rooms 12 and 13, No. 43 Sixth street, San Francisco, California.

Office—No. 309 Montgomery street, Room 50, Nevada Block, San Francisco, California.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Fraacisco, California; location of works, Virginia City, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of September, 1897, an assessment (No. 44) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, rooms 20-22 Nevada block, 309 Montgomery street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 4th day of October, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of October, 1897, at 1 o'clock P. M., to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Rooms 20-22, Nevada block, 309 Montgomery street, San Francisco, California.

DELINQUENT SALE NOTICE.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California; location of works, Inyo County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 30) levied on the 27th day of July, 1897, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
Percy Beamish, Trustee	546	500	50 00
Percy Beamish, Trustee	547	225	22 50
Voss, Conrad & Co	545	301	30 10

And in accordance with law, and an order from the Board of Directors, made on the 27th day of July, 1897, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at their office, Room 323, Phelan building, San Francisco, California, on MONDAY, the 20th day of September, 1897, at the hour of 3 o'clock P. M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

M. A. CAHN, Secretary.

Office—Room 323, Phelan building, San Francisco, California.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

RISDON IRON WORKS,

Office and Works: Cor. Beale and Howard Sts., San Francisco.

READ WHAT MINERS THINK OF THE BRYAN PATENT ROLLER QUARTZ MILL AND JOHNSTON CONCENTRATOR.

OFFICE OF THE CANDELARIA CONSOLIDATED MEXICAN MINING CO.,
SAN DIMAS, DURANGO, MEXICO, October 25, 1888.

RISDON IRON WORKS, San Francisco—Gentlemen: Our company has been operating three of the 4-foot Bryan Roller Quartz Mills, one of which has been running steadily for three years, one for two and one for one year. Our quartz is very hard; we crush through a No. 60 mesh screen. Our mills run 55 revolutions per minute, and each ... sh through 60-mesh screens 12 tons in 24 hours; through 50-mesh, and through 40 mesh, 18 tons. This proportion has been cont...
One set of dies will crush from 1500 to 1600 tons.
One set of tires will crush 1500 tons.
One ring plate will crush from 2200 to 2300 tons.
The mills require very little attention. At our mill ... nary "peon," earning one dollar per day, has complete charge ...
In regard to sliming, in comparison with stamps, by ... of the discharge surface and the continuous agitation by t... pers, a MUCH less amount of slime is created. A three ye... perience teaches me that, in every respect, the mills are a co... success, and of material benefit to the mining world. They ... set up and running in forty-eight hours and can be dismount... same time and removed to wherever desired. Ours were pa... n our mule trail over as difficult a road as any in Mexico. As ... amalgamator it is unequaled by any mill now in existence. Yo... ly.
D. M. BURNS, ... perintendent.

BULLION-BECK AND CHAMPION MINING COMPANY,
EUREKA, UTAH, August 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: Referring to contract made by you with the Bullion-Beck and Champion Mining Company, by which you were to furnish one 5-foot Bryan Roller Quartz Mill on four months' trial, in competition with the Huntington Mill, would say that we have made the test, and the Bryan Mill has proven so greatly superior on all points claimed, viz.: capacity and economy, that we have ordered a second Bryan Mill from you and have concluded to discontinue the use of the Huntington Mill.

Yours truly, JOHN BECK, Pres.
SIMON BAMBERGER, Director. [Copy.] W. J. BEATIE, Sec't'y.

BULLION-BECK AND CHAMPION MINING COMPANY.
EUREKA, UTAH, Aug. 24, 1895.

THE RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: In February last, in connection with the five-foot Bryan Roller Mill which we took from you to test in competition with the Huntington Mill, we also took a six-foot Johnston Concentrator to be tested with ten Frues, one end shake with four belts and one side shake Woodbury. We have been working these machines since the mill was completed, at such times when we had sufficient water.

The terms on which the test was made was that the machine doing the most satisfactory work should be accepted and the others taken out. This did not apply to the Frue, as they were purchased with the plant. In compliance with this agreement, we now inform you that the Johnston Concentrator has proved so superior over the other machines that we now order from you four more of the Johnston Concentrators. Yours truly, JOHN BECK, Pres.
SIMON BAMBERGER, Director. W. J. BEATIE, Sec't'y.

GREAT SALT LAKE AND HOT SPRINGS RAILWAY.
S. BAMBERGER, President and Manager.
SALT LAKE CITY, UTAH, October 10, 1895.

B. R. TAWNDRAW, ESQ., care Guyer Hot Springs, Ketchum, Idaho—Dear Sir: In reply to yours of the twenty-eighth of September, we have been using at the Bullion-Beck Concentrating Works, Frue Vanner, Woodbury and Johnston machines, side by side for the last four months; and after a thorough trial of all of them, we concluded that the Johnston Vanner was doing the most accurate work and was the best; hence, we bought four more Johnston machines and shall continue to use them in preference to any other.

You will find it the easiest regulated machine and very much easier set up than either of the other machines. We bought our machines from the Risdon Iron Works, of San Francisco, where Mr. Johnston, the patentee, personally superintends the manufacturing of them.

Hoping you will make a success, I remain, Yours truly,
[Copy.] [Signed] SIMON BAMBERGER.

THE GOLD VALLEY MINING COMPANY OF SAN FRANCISCO.
C. C. MCIVER, President; D. CUSHMAN, Secretary.
MISSION SAN JOSE, CAL., Oct. 17th, 1895.

RISDON IRON AND LOCOMOTIVE WORKS, San Francisco—Gentlemen: We take great pleasure in having to inform you that, after a careful investigation extending over a six weeks' steady run alongside of six other concentrators, the Johnston which you put in for us was the only machine from which you could not find a loss in the tailings. It has done all you claim for it and has proved more than satisfactory. We intend replacing all our other concentrators with Johnston's, as we are convinced they will pay for themselves many times over in a year. CHAS. C. MCIVER, President.

MINING AND SCIENTIFIC PRESS.

AND PACIFIC ELECTRICAL REVIEW.

No. 1940.—VOLUME LXXV. Number 11. SAN FRANCISCO, SATURDAY, SEPTEMBER 11, 1897. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

The Klondike Region.

Without any meretricious statements this paper has all along been first with authentic news and illustrations of the new northern El Dorado, and in this issue presents the first half-tone engravings ever made from photographs taken recently in that region. The dump on El Dorado creek shows the spot from which C. J. Berry of Fresno, Cal., took the $135,000 that has set so many people wild. The view of Dawson City, the Klondike on the left, shows a most desolate and forbidding region. The sluice-boxes depicted in another view do not show anything new to a California miner, the picture being solely interesting from the fact that the man who sent that photograph assured the MINING AND SCIENTIFIC PRESS that those sluice-boxes were on a claim which, it was calculated, would turn out $2,500,000. Let us hope so; too many ciphers cannot be put after figures to indicate the amount of gold that such a country ought to yield in part payment for the misery occasioned to all who live there. The water wheel with rude buckets attached for raising water on the famous "Claim No One," above Discovery, on Bonanza creek, and in that locality is considered a splendid piece of engineering construction.

The Klondike placers are similar in surroundings and amount to those in Siberia, and similar in origin to placer gold the world over—gold set free from its lode matrix by climatic action, running water and gravity being the two later factors in placing it where reached by man. Despite the theory and arguments of so many, it is believed that glacial action has had little or nothing to do with the Klondike gold placers. In the æons of ages during which the gold now coming to light was being ground out of the lode the glacial period forms a very insignificant proportion, being but part of a comparatively recent epoch. As in California the placers were formed long before the period of glacial action, that age only serving to hold them in structural place. As in California the Klondike placers are but beds of eocene and miocene streams, river channels ancient as the sun. The main difference between the two localities is that the glacial age was over in California before that northern region where in some places the mighty effect of glacial power is still apparent in the still living rivers of ice.

It will be interesting, as research goes on, to note the geological similarity as reported by Government scientific and topographical expeditions. Still more interesting will be the final demonstration of the source of all this placer gold of the Klondike. It is simply a matter of analogy to assume that quartz as rich but no richer than that of California has been the rock matrix from which the frost freed the nuggets now being so eagerly reached after by the adventurous. From a vertical depth of 1700 feet and a horizontal extent of 1000 feet the Idaho quartz mine in Nevada Co., this State, has yielded gold to the value of $17,000,000. The slow eroding action of Nature in such a lode would grind out a placer fully as rich as the whole Klondike, so far as sounded. A "mother lode" or a "father lode" in far Alaska, through a million years of Nature's slow abrasion, would yield as much placer gold as man in a few brief years could mine from the original quartz. It is probable that some time in the twentieth century machinery to sink on the ledge, hoist the ore, crush it in a mill, catch the gold on the plates, concentrate the sulphurets and chlorinate or cyanate them will be moving northward, but it is not likely that in the present generation any other form of gold mining than that practiced in California's earliest placer days will be followed in the dreary country that for the past sixty days has attracted more attention than any other gold-producing region on the globe.

Of Practical Value.

In an article on page 216 in the issue of September 4th Mr. Postlethwaite tells of New Zealand river dredging for gold, giving some practical pointers on what has proved to be a valuable method, and modestly suggests that while California can teach the rest of the world a good deal about gold mining, this is one of the methods in which another gold-producing section of the globe can teach California. Costly experience and effort in New Zealand have evolved a system of river dredging which California can note and follow with profit. The inventive California miner has in the last fifty years produced a great many devices that others, elsewhere, have adopted, but this State has no feeling of self-sufficiency, and gladly gains from any and every source anything of practical value. While there is no corner of the globe where gold mining is carried on that a California device is not found, yet, "everybody is wiser than anybody," and collective genius is needed to solve the many hard problems encountered in mining gold.

There are miners who know it all; who can not be told anything; who have learned everything, and have reached perfection. Such degree of knowledge is sometimes manifested by millmen, and to hint that their methods and practices might be improved would not to their ideas be orthodox. But such hide-bound operators are, fortunately, few, and California possesses a very small percentage of them. It is only by interchange of ideas, publication of experience and result of experiment that general knowledge can be secured. Science is simply organized knowledge, and is resultant on such articles as that furnished in this journal by Mr. Postlethwaite. For nearly thirty-eight years this paper has encouraged the publication of such articles written by men who know what they are talking about, and it is believed that the means of intercommunication thus afforded those who guide and control the operation of mines, mills and mining systems the world over has, more than anything else, aided in the progress of scientific mining. The thousands of technical and descriptive articles on different mining matters published herein constitute a record of experiment, experience and practical knowledge unequaled elsewhere, and any communication from a practical mining man is always gladly given the prominence that its merits warrant.

Coinage of Silver Dollars.

There was no coinage of standard silver dollars under the Sherman law during August, and there will probably be no such coinage during this month. These facts do not indicate an absolute abandonment of the coinage of standard silver dollars by Secretary Gage, but are due to the strong pressure for subsidiary silver—dimes, quarters and halves—from all quarters of the country. The revival of trade activity, especially in the West and South, is causing a demand for small silver which can hardly be met without active work upon the accumulation of worn coin and bullion in the treasury. The amount of fractional silver coin reported at the various subtreasuries on the last day of August was $15,377,604, but this was widely scattered, except a large lump which is not in fit condition to issue and which is held in Washington. Director Preston is desirous of avoiding any just cause of complaint in regard to the promptness and sufficiency of the coinage supply during the summer and autumn. He put the whole force of the mints upon subsidiary coinage and gold coinage during August, and turned out more than 3,000,000 pieces of small silver, amounting to $116,000 in dimes, $351,000 in quarters and $234,436 in half-dollars. The work on gold was done principally at the mint in this city and resulted in the coinage of 816,910 pieces, valued at $8,756,250. The problem of coining standard silver dollars under the Sherman law may soon become serious, however, if Secretary Gage adheres to the interpretation of Secretary Carlisle regarding the law. He has not yet shown any disposition to adopt a new interpretation, and has permitted the treasurer to cancel Sherman notes redeemed in silver dollars and to issue silver certificates for dollars presented for that purpose.

The demand for standard silver dollars is considerable during the summer and autumn, especially from New Orleans and other Southern points. A part of the demand can be supplied from free silver in the treasury, under the Bland law, but when this margin rules low, as is the case at present, silver has to be taken from the fund obtained under the Sherman law and used for the redemption of the Sherman notes. This redemption fund stood at $11,034,657 at the beginning of July, but was reduced to $8,411,204 on August 31st. The cancellation of Sherman notes, after their redemption in this manner, has gradually reduced the amount outstanding from $155,000,000, when the purchase law was repealed, to $112,672,280 at the close of August. Of this sum, $29,759,488 was in the treasury and its branches, leaving about $83,000,000 in the hands of the public.

This coinage of standard silver dollars under the Sherman law would not add to the circulation, except for the seigniorage, amounting to about 33 per cent, which is regularly covered into the treasury. This seigniorage, and the bank note circulation and the gold shipments form the only means of expansion of the currency, except such as is due to movements to and from the treasury and the banks. The treasury officials regard the circulation as very nearly in a normal condition, and do not look for large importations of gold during the autumn. They expect the large crop movement to be compensated by merchandise imports and the purchase of securities now held abroad, rather than by the movement of gold.

A Questionable Proposition.

The continued depression in the price of silver has occasioned new financial plans formerly unheard of in connection with silver mining enterprises. One of the latest is a sort of warehouse certificate idea, based on the grain storage custom. Every producer of silver in the west half of America is receiving a circular from a concern in St. Paul, Minnesota, which proposes to "buy, sell and hold in trust gold and silver bullion." The scheme is not without its advantages, but is as one-sided as the handle of a jug.

The plan is for a mining company in this State, Montana, or Colorado, etc., to deposit silver bullion with the local bank or safe deposit company, which local concern will "forward a warehouse receipt" for the amount of such bullion at current market rates to the St. Paul company, which, upon receipt, will issue a corporation certificate of deposit and return it to the local bank, which in turn, will give it to the depositor. This certificate will agree with the depositor to hold the bullion "until it shall reach an elevated price, which shall be named in the certificate, when the bullion shall be sold and the certificate called in and cashed." Producers of silver bullion are invited to enter into a combination contract and agreement with the St. Paul corporation that they will place all of their production into the hands of the corporation and accept the corporation certificate of deposit therefor. That concern says that its certificate of deposit will at all times be worth the price of the daily market for silver, and producers of silver bullion will be allowed to hypothecate their certificates for cash, thus giving producers a chance at any time to realize the going market price of silver, and enjoy the privilege of carrying their certificates "until the price of silver bullion shall have attained the elevated price named in the corporation certificate."

It is believed that the advantages of the plan so far as the producers are concerned will not be so manifest as to cause a general acceptance of the idea. It is probable that a silver producing concern that cannot find any present profit in operating will feel more inclined to let the silver stay where it is "till it shall have attained an elevated price," rather than mine and mill it for deposit in Minnesota or Nebraska.

PARAGRAPH 181 of Section I of the new tariff law, in placing a duty of 1½ cents per pound on the lead in all kinds of lead-bearing ore, especially provides that on all importations of lead-bearing ores the duties shall be estimated at the port of entry, and a bond given in double the amount of such estimated duties for the transportation of the ores by common carriers bonded for the transportation of appraised or unappraised merchandise to properly equipped sampling or smelting establishments, whether designated as bonded warehouses or otherwise. On the arrival of the ores at such establishments they shall be sampled according to commercial methods under the supervision of Government officers, who shall be stationed at such establishments, and who shall submit the samples thus obtained to a Government assayer, designated by the Secretary of the Treasury, who shall make a proper assay of the sample and report the result to the proper customs officers, and the import entries shall be liquidated thereon, except in case of ores that shall be removed to a bonded warehouse to be refined for exportation as provided by law. The Secretary of the Treasury is authorized to make all necessary regulations to enforce the provisions of this paragraph. From several communications received it is evidently a matter of general belief in some quarters that the above creates a large number of new positions, and that Secretary Gage has the appointment of a myriad of "Government assayers." The act does not make any considerable departure from the method in vogue heretofore, and it is believed that applicants for possible vacant positions are wasting effort. The old law which the Dingley act supersedes had practically the same general requirement.

WITH the compliments of a Chicago railroad company comes a map portraying one-half the globe, the central idea being that the Atlantic ocean be abandoned or not reckoned in international transit. It is an old idea in an attractive shape, and developments in these sunset years of the century take it into the realm of possibility. By the map, which seems a sort of half-joke-whole-earnest notion, one goes from New York City by rail to this coast, northward, through British Columbia, over a to-be-constructed railroad to the mouth of the Yukon (with an incidental side trip to the Klondike), thence still northward coastwise to a point opposite the extreme eastern projection of Siberia; a ferry voyage of over 100 miles, the railroad trip renewed down the Siberian shore to Vladivostock, St. Petersburg, Moscow, Berlin, Paris, London—about 11,000 miles. Why not! More difficult things have been achieved. Clarence King says: "The time is not far distant when a man can start out of Denver and travel to Klondike, stopping every night at a mining camp. Already two American stamp mills are pounding away on the borders of the Straits of Magellan, and the day is approaching when a chain of mining camps will extend from Cape Horn to St. Michael. Before the end of the twentieth century the traveler will enter a sleeping car at Chicago, bound via Behring straits for St. Petersburg." One thing is manifest: The coming century, like all other centuries in the world's record, will hold such progress in scientific mining that other arts and industries will follow. Upon mining rests all the stir of life, the wealth of nations, the fortunes of manufacturers and the prosperity of individuals. The little map and the quoted prediction may be reality in the lives of many who read this.

Concentrates.

THE Salt Lake, Utah, Mining Exchange was reopened this week.

MERCUR, UTAH'S, gold output is now figured at $75,000 monthly.

TIN is reported discovered on the Bonaparte river near Ashcroft, B. C.

SEVERAL Sandon, B. C., miners are leaving for the mythical mines of Peru.

TEN DOLLARS is the fee for application for mineral entry or land for a mill site.

THE Mt. Morgan mine, Australia, annually produces about 150,000 ounces of gold.

UNITED STATES mining machinery is admitted free of duty into British Columbia.

THE Salt Lake *Tribune* is the best mining paper between Colorado and California.

CALIFORNIA Chinamen are shipping Mexican dollars to the Orient on private account.

MESA GRANDE, San Diego Co., Cal., reports discovery of an unusually fine asbestos ledge.

TELLURIDE ore of unusual richness is reported discovered at Gaynor creek, Kootenay lake, B. C.

LARGE and rich deposits of mercury are reported discovered on Noggriga creek, New South Wales.

THE Plymouth Rock mine, Milton, Calaveras county, Cal., will not be reopened until next spring.

IT is locally thought that a bank and a cyanide works at Mojave, Cal., would be paying enterprises.

FOR the first time in the history of the nation it takes five ounces of silver to buy a hundred pounds of flour.

THE total cost of the 40-stamp mill put up at the Gwin mine, Calaveras county, Cal., one year ago, was $21,000.

THE Independence gold mine, Victor, Colo., is reported netting its owner, W. S. Stratton, $50,000 per month.

LIQUID AIR is not for sale in this city. So far it is a laboratory production, and is not an article of commerce.

PROPHETS now prophesy that lead will reach $4.50 per 100 pounds by the close of the year. It seems probable.

THE illustrated article by Aug. J. Bowie on "Ditch Construction" was published in the issue of Feb. 27, '97.

RECENT glittering reports of rich gold fields on the Yaqui river in Mexico are declared in Colorado to be baseless.

YESTERDAY'S dividend of the Mercur, Utah, M. Co. brings the total of that Utah company's dividends up to $800,000.

AT Platina, N. S. W., platinum with the gold was saved during 1896 to the amount of 1900 ounces, valued at £3915.

FIRE last week destroyed the hoisting works and part of the shaft of the North Mountain Co., Egan canyon, Nevada.

GRADERS for the Sierra Railway have reached Jamestown, Cal. It is expected that trains will be running into Jamestown in sixty days.

THE mining business in Los Angeles is on the increase. Two more mining papers have recently started in the Southern California metropolis.

A SOUTH AFRICAN miner invented a tool sharpening machine about two years ago, but so far it is believed that it has failed to be a practical success.

E. BEAUDETTE of Murray, Idaho, claims to have discovered a new and sure way of extracting gold from black sand. As usual, he employs "chemicals."

THE National Park Company, South Pass, Wyoming, contemplates putting up a mill, concentrators and a chlorination plant at a probable cost of $40,000.

AT a recent meeting of the Tuolumne, Cal., Miners' Union at Quartz Mountain it was decided to pay benefits in case of sickness or disability at the rate of $7 per week.

A NARROW GAUGE railroad from Guthrie, on the Arizona & New Mexico Railway, to Morenci, Arizona, sixteen miles, is to be built by the Copper Queen Mining Company of Bisbee.

THE notorious Hartsfelt and the International Ore and Reduction Co. are heard from at Marble City, Colorado, this week. They seem able to fool some of the miners all the time.

MANY inquiries received weekly are answered in this column, the question being usually omitted and the answer given in the briefest possible form consistent with accuracy.

No. 1, VOL. I of the *Klondike News*, alleged to be published at Dawson City, N. W. T., bears date July 17, '97. It has not a San Francisco printer's imprint, but looks as though it might.

MERCUR, "Camp Floyd" district, Utah, is a lively mining section. In addition to plants now in operation it is locally figured that ten new mills will be built in that section by June 1, 1898.

ARIZONA'S mining law does not admit of the relocating of claims where such relocation is plainly to avoid assessment work, and is mandatory in compelling locators to do development work.

SINCE July 15 about $800,000 in gold has been received at San Francisco from the Klondike, and when the next Australian steamer arrives about $5,000,000 will have been received from Australia.

THE Klondike transportation and investment companies have about harvested the season's crop of dupes. These cormorants will share with sensational newspapers the odium of consequent suffering.

IN this State mountain quail and grouse can only be killed between September 1st and February 15th. Valley quail cannot be killed before October 1st. Male deer can be killed up to the 15th of October.

THE United States land department has held that a corporation seeking patents to mining lands must comply with the corporation laws of the State where the property sought to be patented is located.

A BOSTON company, "$3,000,000 capital," advertises "control of a dry washer so that the ground may be worked at all seasons whether the water is frozen or not." Fancy a "dry washer" in the Klondike.

A NEW SCHEME for handling dump ores to which high grade talc adheres is in use at Colorado Springs, Colo. It is a washing process that gives the talc as a concentrate product that runs from $100 to $250 a ton.

A SPOKANE, Wash., man has chartered a schooner to take "an armed force of 100 men to Copper river next spring." Any one, armed or otherwise, would do well to postpone adventuring in Alaska till next year, but there are more necessary conditions than going "armed." Better leave the "arms" at home and take plenty grub.

A LETTER signed by J. H. Rothschild, from London, England, positively announces that a syndicate of that name will erect a smelter in Vancouver, B. C., next winter to cost £250,000; capacity, 250 tons a day.

A FOUR-FIFTHS INTEREST in the Freeland mine, Idaho Springs, Colo., has been sold to the Gold Coin M. Co. for $130,000; $50,000 down, $80,000 in sixty days. The company will spend considerable in development work.

A COMPANY can be formed in British Columbia by the signature of a memorandum, or memorandum and articles of association, by five persons, on payment of registration fees and filing of the usual particulars under joint stock company systems.

DIRECTOR WALCOTT of the U. S. Geological Survey is authority for the statement that running west of north through the Yukon valley is a broad, continuous belt of quartz carrying gold, silver, copper and lead. The gold-bearing ore is low grade.

THE number employed in gold mining in New South Wales during 1896 was 12,069 quartz mining, 9428 Europeans and 710 Chinese hydraulic mining—a total of 22,207 men, an increase of 773 on 1895. The aggregate of gold during the year was 296,071 ounces.

A REAL ESTATE SPECULATOR has turned his attention to mining stocks in British Columbia properties and announces in an Astoria paper that "a limited amount of non-accessable stock can be had at 10c a share." Buyers should at least be allowed to get the stock.

OWING to the fall in the price of silver, the Mahala mine at Leadville, Colo., employing fifty men, has announced a reduction in wages from $3 to $2.50. The men accepted the reduction. The Mahala is one of the largest silver producers in the Leadville district.

FOR the hundredth time a Meadow Lake scheme has fallen through, this time a Utah proposition to erect a new style of smelter to work the ore. The result of the last venture is several miles of a well-built road from Cisco to Meadow Lake, and several unpaid workmen.

THIS week's $10 dividend of the Calumet & Hecla Mining Co. makes $20 this current fiscal year and $40 this current calender year. Total payments now foot up $50,850,000 to shareholders. In Nevada, on the Comstock, the California and Con. Virginia have paid $77,608,800 dividends.

THE annual report of the Chief of U. S. Corps of Engineers for 1895, regarding the amount of debris resting in the Sacramento, Cal., drainage system, estimates 308,000,000 cubic yards in Yuba river below DeGuerre Point, and 100,000,000 cubic yards between Smartsville and DeGuerre Point.

THE California Iron and Steel Company have bought the plant at the Iron mine, four miles from Clipper Gap, Placer county, Cal. The machinery will immediately be removed to San Francisco. This is the latest phase in the history of what was expected to be a flourishing industry at that point.

THE Golden Scepter Mining Co. of Phillipsburg, Mont., will have to do nearly $5000 assessment work before January 1, '98, to represent their unpatented claims. A great many companies and individuals have only 111 days from date to do enough work to hold their claims for the ensuing year.

AN unfounded claim is reported that Dawson City is in United States territory. Should, however, international question arise and the matter be as slow of adjudication as the seal controversy in Bering sea, nearly all the placer gold in the disputed region will have been mined by adventurous Americans before the question would be definitely settled.

ANY ONE outside of California wishing a copy of the last report of the State Mineralogist should forward one dollar to the State Mining Bureau, this city. Any one in California can secure a copy by sending seventeen cents to prepay postage. It is understood the present State Mineralogist will not issue a similar report.

IN Montana, Utah, Colorado and elsewhere the increasing value of lead will, it is thought, lead to the reopening of several silver-lead mines, closed on account of the decline in silver, and the novelty will be witnessed of "lead" mines in full operation, producing 25 per cent of lead with 75 per cent of silver as a "by-product."

UNDER the act passed by the recent State Legislature (which so far has not been declared unconstitutional) superintendents of unlisted mining companies in this State are not required to make weekly or monthly statements, nor are mining secretaries of such companies compelled to keep their accounts open to shareholders' inspection.

DURING August, of the 27,122 tons ore output of the Cripple Creek, Colorado, district, nearly half was cyanided, 6500 tons went to the smelters and the remainder was chlorinated. The result is thus locally figured: Sixty-five hundred tons smelting ore, $455,000; 19,522 tons mill ore, 546,616; 1100 tons at stamp mills, $11,000; total, $1,012,616.

SOME of the most attractive of the dozen different "guides to the Klondike" received at this office are almost literal copies of the descriptive matter regarding that region written by experts for this paper, and published in recent issues; and, so far as that part of the prospectus is concerned, are reliable, the compilers showing excellent judgment in selecting an authentic account of the country they profess to exploit.

IN the construction of the 40-stamp mill, Amador county, Cal., five concrete piers are added to the timbers for each twenty stamps, thus admitting replacement of knee frame, knee-beam timbers, knee-beam posts and mortar blocks without shutting down more than five stamps. V. S. Garbarini, builder of these piers, thinks that concrete will eventually be substituted for timber in the construction of mortar blocks.

THE loss to California farmers by the stoppage of hydraulic mining is treble the gross amount of contributory damage occasioned by the debris, and approximates the loss to the miners themselves. It is time this debris question be reopened and the fact recognized that the greatest measure of prosperity to the farmers themselves is in line with a home market and the development of all the industries of the commonwealth.

COLONEL BAKER, British Columbia Minister of Mines, defines the meaning of the phrase "rock in place" at greater length than the California definition. He announces that "rock in place shall be deemed to mean and include minerals not necessarily in a vein or lode, that is when discovered in the same place or position in which it was originally formed or deposited, as distinguished from loose, fragmentary or broken rock or float, which by decomposition is found in wash gravel or sand. Valuable deposits of mineral shall mean and include mineral in place in appreciable quantity, having a present or prospective value sufficient to justify exploration."

THE steamer National City, which left St. Michaels, Alaska, Aug. 27, is to hand and confirms the warnings given in this paper since the beginning of the Klondike craze, namely, that starvation is imminent at Dawson City. Considerable food was sent from this city and northern ports, but it is considered impossible to get sufficient up the Yukon or across overland to prevent scarcity. The steamer Excelsior with eighty passengers from the Yukon is expected here this week.

IN Colorado, says the *Review*, the average contents of the low-grade sulphide silver ores, such as are produced in large quantities in Leadville and in some mines which concentrate their product, is from 10 to 12 ounces per ton. The decline of 12 cents per ounce in silver amounts to from $1.20 to $1.50 per ton, and this wipes out the profit in many cases and forces suspension. On lead-silver ores the advance in lead prices has about offset the fall in silver, so they are affected less.

CAPT. LEE from the Klondike says: "As to the amount of gold taken out of Klondike since the strike in August, '96, the total does not exceed $1,700,000. Of that amount about $1,000,000 has come south. The remainder has gone in wages, expenses and reinvestment in claims. During the same period over $1,000,000 has gone in provisions and supplies. At the present moment the trading companies at Dawson have orders for food and supplies for the coming winter from miners already there to the amount of $1,500,000. On this summer's rush alone about $600,000 has been spent. More has been spent in steamboat passages to Alaska than has been taken out of the Klondike. In other words, the Klondike excitement has cost $10,000,000 up to date and has produced about $2,000,000."

THIS is how those things are viewed in Boston, and is from the *Herald* of the 1st inst.: "The uses of quicksilver have increased so largely in recent years that imports of the metal are considered a possible necessity of the near future. Mining consumes a good deal, but mechanical and chemical arts are fast becoming a great absorbent of the metal. Tinfoil has supplanted quicksilver in the construction of all save the highest grade of mirrors. There is said to be only about 4000 flasks of 76½ pounds net in the country, a reduction of two-thirds in a comparatively brief period. The price has risen quite steadily, and appears not to have been checked. These facts are of important advantage to Boston's quicksilver mining properties, the Napa, Ætna and New Idria. The first named is said to be earning at the rate of $12,000 net per month, and the last named two-thirds as much. The New Idria has lately enlarged its territory by buying the lode and territory between its old workings and its San Carlos mine, giving it a good mile of well nigh virgin ground. Good dividends and an accumulating surplus appear to be in sight for all of these properties. There is no speculation in the shares of either of these companies, and it is doubtful if any reasonable bid would bring the shares from investment boxes. The management of the properties is industrial, not speculative."

THE *Inter-Mountain* says that the safety cages which the last Montana legislature ordered placed in all mines of 300 or more feet in depth are not meeting with much favor in Butte. Several of the mines were equipped with the cages on June 1st, when the law went into effect, but two or three of the big companies were slow about adopting them in all their mines and few of the shafts of the big copper producers are now using them. It is intimated that some of the Butte companies have decided to fight the law compelling enclosed cages to be used. At the time the bill was passed in the legislature it was believed much good would result from their use. Their use in many of the shafts of Butte, however, has been found impracticable, it is said, and the miners themselves are the principal objectors. The miners say they are nothing but a death trap and that they are a great deal more dangerous to life than the open cage. In the copper mines the material rots rapidly under the action of the copper water and unless replaced frequently the doors are liable to become loose and swing into the shaft, a contingency which would be fraught with great danger in a rapidly moving cage with men aboard. Another objection urged against the cages is that the ground around Butte is so soft that it is almost impossible to put in a good shaft and that in consequence some of the shafts "spring" in spots rendering the guides and wall plates uneven. With the open cages these spots are easily detected and the defects remedied before damage results, but in the enclosed cages it is impossible to see the timbers.

DIRECTOR C. D. WALCOTT of the U. S. Geological Survey was in San Francisco this week on practically the same general business that recently called Commissioner of the General Land Office Hermann to this city. Director Walcott says: "I am making this trip for the purpose of learning the real sentiment of the people as to the forest reserves which have been the subject of so much criticism and which I fear are little understood. I believe in the preservation of the forests of the country, and that Government control is the only means of accomplishing such preservation. It has given me much satisfaction to find the people whom I have met, as a rule, in favor of protecting the forests from fires and the young timber from the woodman's ax. I meet with many objections to the plan of forest reserves, but I do not believe that those who make the objection fully understand the plan of the Government or the scope of the order setting aside the forests. The industries of the West are not injured by the reservation order. It is expressly stated that no forest reservation shall be established except to improve and protect the forest or to maintain the waterways. The idea that no timber on the reservations can be used is an error. The locating of mines and mills is not prohibited, and all matured and dead timber may be used as heretofore. The Government seeks only to prevent wanton destruction of timber, and when the people understand that this is the real object, many of the objections that have been urged will not be heard." Director Walcott left San Francisco for Yosemite valley last Wednesday. He proposes to make topographical maps on a two-mile scale of all the forest reserves in California, which includes recent additions—a total of 6,647,000 acres. On these maps the distribution of forests will be platted out, showing the commercial and the non-commercial timber, the agricultural lands included in the forest reserves, the portions burnt over, and all settlements, roads, houses and other improvements upon the national forest domain.

Amending Federal Mining Laws.

TO THE EDITOR:—The amendments proposed by Col. W. S. Keyes to the Federal mining laws will not suit the bona fide miner and prospector. He says in the PRESS of Aug. 21st last that he "would do away with the extra lateral right altogether, but would permit patenting under the present law until Jan. 1st, 1900." That is, he would force the miner or prospector who has uncovered a valuable lode or vein to procure a patent in the time named or relinquish his claim, or part of it, without regard to the miner's financial ability to secure such patent. "Doing away with the lateral right" means also that the mining location would be confined to the surface lines extended vertically downward all round the claim, cutting the vein at the side line on the hanging wall of the lode, and compel the miner to suspend operations on the downward course of the vein at that point, unless he was fortunate enough to have located the extra thousand feet Col. Keyes would allow, else he would have to buy that much, if he could, in the direction the vein dips. This is the law, or was, in the Rand, in South Africa, and would work here as it did there—force the mining companies to buy adjoining ground or see their mining plants rendered valueless, for in most instances the discoverers would not have time to make the additional locations on the side of the first. In addition to this, the discoverer of a vein would get only half the width of his surface ground on his vein, for the outcrop of the vein would be in the middle of the location. In the case of an old mine once operated and closed down, it could not be sold, as there would be a strong doubt as to there being enough ore in the mine to pay for reopening the same. An illustration of this: A mine sold here recently that has been idle for nearly thirty years has an incline 400 feet deep sunk on the vein which has a dip of 28 deg. 30 min., surface ground 600 feet wide, vein croppings in the middle of the claim, and land on both sides covered by other locations; when the shaft is cleaned out the purchasers of this mine would find that they had 58.6 feet of incline shaft and old stopes in ground owned by other parties, if the proposed amendment of Col. Keyes were in force; and if such was the law the mine would probably never be opened, not even though it is known that much of the ore formerly extracted yielded from 5 to 7 cents per pound. The third proposition, as do the others by Col. Keyes, would in effect tie up the prospector's pick, as most prospectors can do and will do the necessary $100 worth of work to hold a claim, if for no other purpose than to uncover something on the lode that will sell his holding, while most of them would find it difficult to make a payment of $50 cash each year. If the present laws governing lode claims are enforced and the cost of obtaining a patent made cheaper, and the laws that govern placer locations altered so as to allow the gravel miner to follow the pay channel in making his location, with a larger amount of ground allowed to drift gravel mining companies, so as to secure to them enough of the pay channel, it will be all that is required, and will increase the mining industry and gold output to a great extent.

Nevada City, Aug. 30, '97. E. H. MOORE.

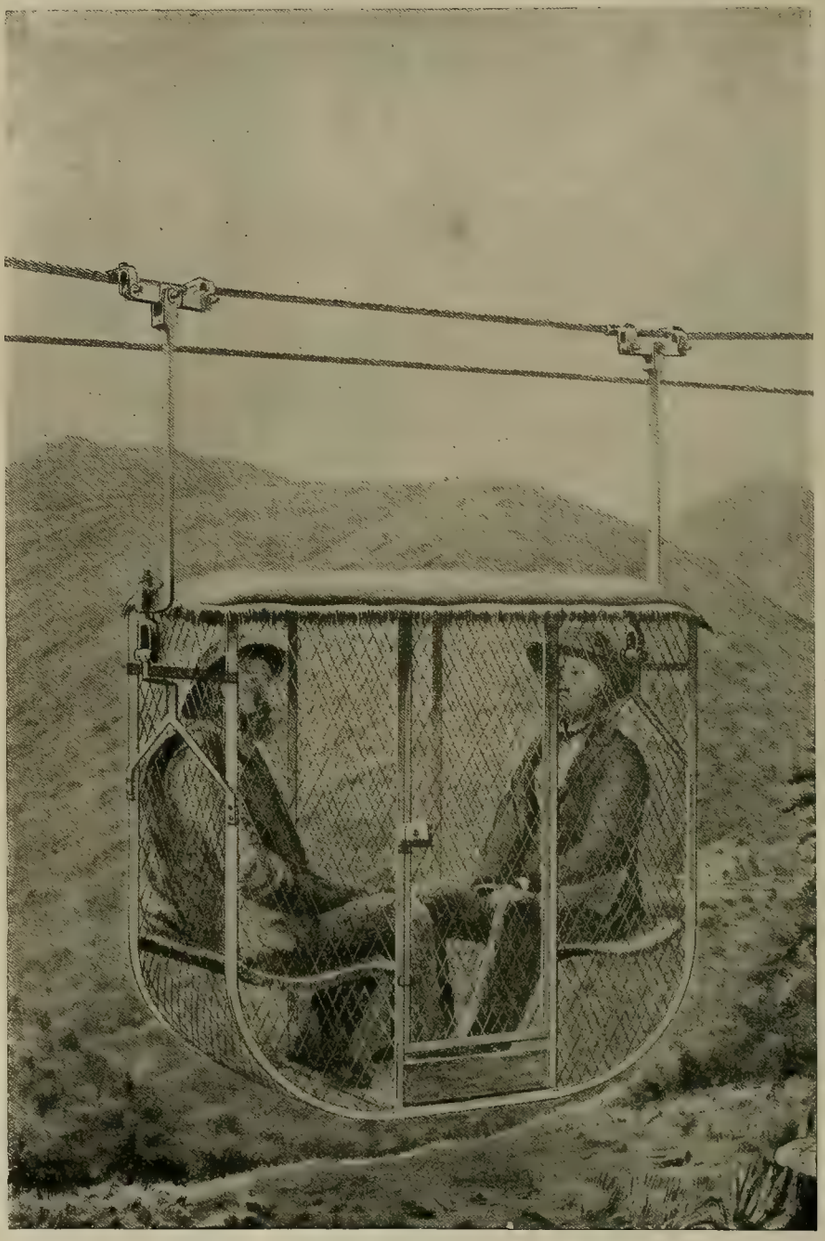
Workmen in Europe and America.

Charles Davis, president of the Davis & Egan Machine Tool Company of Cincinnati, who recently returned from a tour in Europe, says: "The only way to get at the industrial situation in Europe is to dig right down into the locomotive works, gun works and machine shops. Watch the men at their work. You will see them dull and listless. The workman looks through the glass at the end of the shop and sees the proprietor—there only because he is the son of his father. He says: 'It is impossible that I could ever be in there.' And he plods on like a galley slave. Not so with the workman in the United States. He looks through the door at the end of the shop and sees the proprietor there busy with his plans. He says: 'Very well, my friend; it was only a short time back that you were out here in the shop where I am now. Some day I will be where you are.' He puts his lathe on a faster speed and the chips fly. The proprietor, seeing his work, makes him a foreman, then superintendent, and then a partner."

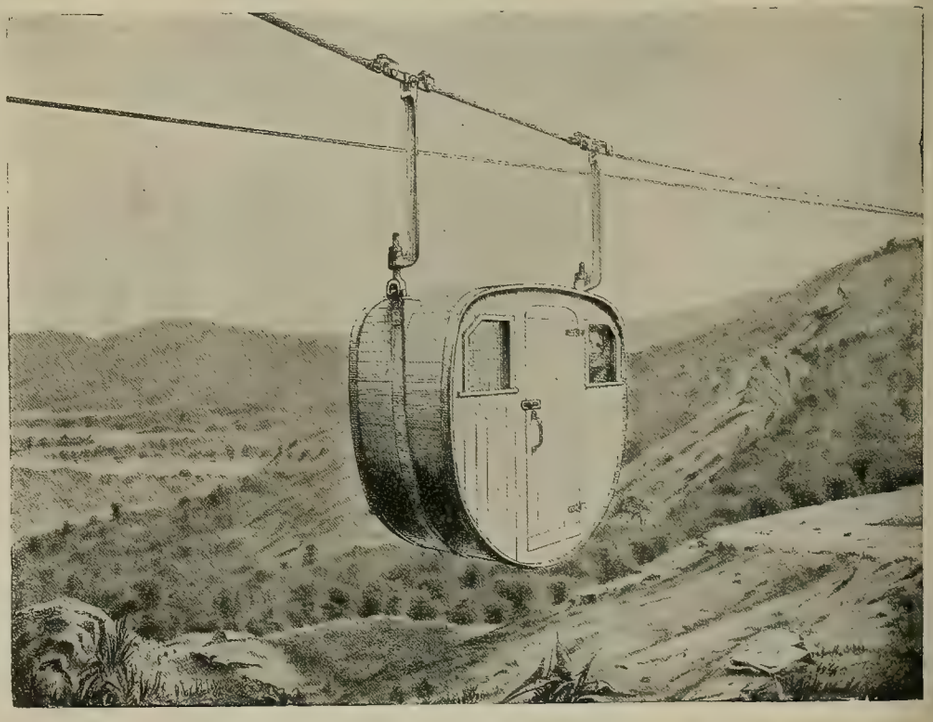
THE census of '96 indicates that Chicago has made the largest increase in population in the interval since the last national census in '90. Its population is given as 1,619,226 in '96, as compared with 1,099,850 in 1890. New York seems to have made the next greatest gain among the large cities, its population being put at 1,995,000, as against 1,515,301 in '90. Brooklyn comes next, having increased its population from 806,343 to 1,100,100. Philadelphia shows an advance from 1,046,964 to 1,188,793. St. Louis shows a gain from 451,770 to 570,000, Boston from 448,477 to 516,305 and Baltimore from 434,439 to 506,378. These represent the cities having a population in excess of 500,000.

Of Probable Value.

The chief difficulty in the overland route to the Klondike seems to be a short stretch of rugged country that deters many from further progress. Thousands of columns in the dailies tell of the horrors of that little stretch of mountain, the impassable mud, the huge boulders, the steep climb, etc. It is out of the



WIRE-WORK CARRIAGE—PASSENGER TRANSPORTATION.



CLOSED CARRIAGE—PASSENGER TRANSPORTATION.

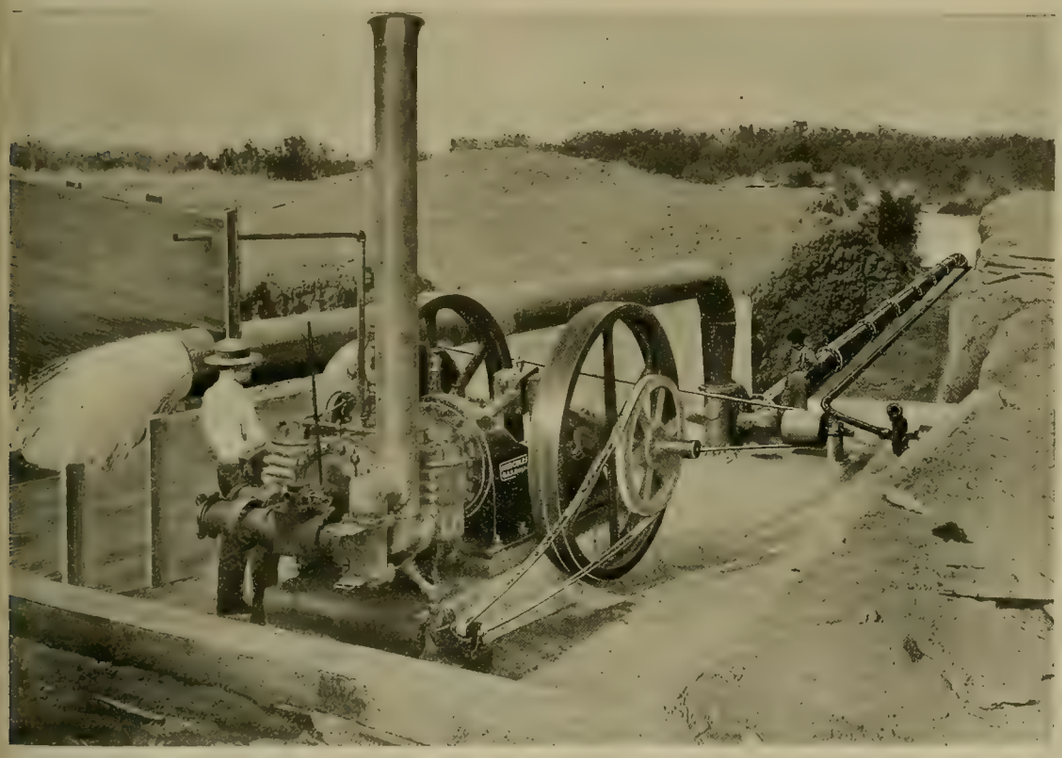
question to suppose that any difficulty of transit, however apparently insuperable, can long detain the American miner, who before now has removed mountains, turned the course of rivers, hung a tramcar in the air, tied a loop in a railway track and successfully solved any and every difficulty presented.

It is believed that the ropeway in such successful use in many mining districts could be utilized in this instance. It is suggested that a railroad will ultimately solve the problem should the mines prove rich enough and the travel continue in sufficient volume to warrant building; but till such time as a road is built something better is needed than the pull-dog-pull-devil style of travel so painfully portrayed in all the accounts from that miserable country.

The details, style of construction, cost, etc., of these wire ropeways have been repeatedly published in this paper, and everyone connected in any way with mining or the transit of materials over a rough country is presumably familiar with the matter. It may, however, not be so generally known that this style of conveyance is capable of carrying passengers, as well as freight, ore and supplies. On this page is portrayed two styles of carriage, closed and open, used for passenger transportation on such aerial tramway. For the two engravings we are indebted to the courtesy of Mr. Parsons, manager of the Hallidie system of ropeway transportation.

A Large Irrigating Plant.

There is an immense amount of land in California contiguous to waterways which can be successfully



A LARGE GASOLINE PUMPING PLANT.

and profitably irrigated. Where ditches can not be run from some higher point on a stream, other methods of supplying the water to the land have to be introduced. Considerable has been done in the last few years in the building of gasoline pumping plants for this particular purpose. There was recently installed on the 7000-acre ranch of George H. Packer, about ten miles above Colusa, the largest gasoline pumping plant in existence. It consists of an 80 H. P. Hercules gasoline engine and a 15-inch Krogh Manufacturing Company's double suction centrifugal pump, taking water from the Sacramento river and delivering it into a ditch 27 feet above the water level.

The plant was guaranteed to deliver 6000 gallons a minute, but it has exceeded the guarantee by about 1200 gallons. The flow is in excess of 7200 gallons, 432,000 gallons an hour, considered sufficient to cover 384 acres to a depth of 1 inch every twenty-four hours.

The engine and pump are set on massive concrete foundations, the centers being 32 feet, to allow for sufficient length of belt. The main suction and discharge pipes are 20 inches in diameter, and the distance from river to point of discharge is about 200 feet. The main driving belt is six ply, 20 inches wide. The plant was constructed by the Hercules Gas Engine Works of San Francisco, who have been building some very large engines for irrigating and mining purposes. These engines are economical, and do not require the services of an experienced engineer. They burn either gasoline, distillate or crude oil, and, the makers say, will do the same amount of work for about one-half what a steam engine will, burning coal. The consumption of fuel in this particular plant is stated to be less than one-eighth of a gallon an hour for each H. P. The success of this plant shows what can be done in irrigating in California land, and will probably lead to the erection of a number of other plants.

Prospecting with the Diamond Drill.

The Wildman mine at Sutter Creek and the Alma at Jackson are using the diamond drill with success. The former is the pioneer in its adoption.

The Machines.—The diamond drill used at the Wildman has a 7-inch cylinder and 5-inch stroke. This machine will drill a hole 600 feet long and take out a core $\frac{15}{16}$ inch in diameter. The drill is similar to others of its class in regard to the automatic hoist to raise the rods and the small auxiliary pump which keeps a current of water circulating down the rods and up the sides of the hole. The drill, hoist and pump are worked by compressed air. The weight of the machine complete is 585 pounds. A man and a boy are required to operate it. The drill at the Alma is similar in principle to that at the Wildman.

Speed.—The speed of the drill varies with, first, the direction or inclination of the hole; second, the kind of ground; third, the depth of hole.

When a hole is drilled vertically downward, which is seldom if ever done underground, the weight of the rods aid in the drilling. A horizontal hole in quartz averages 30 feet a day at the start, the speed decreasing to 20 feet per day toward the finish. In a long run these figures are high and this speed will not be realized. One hole 600 feet long averaged 16 feet per day. The Mariposa slate of the lode drills easy but care must be taken to keep the holes straight as the drills tend to follow the cleavage planes of the slate.

Power.—The power required to run a drill such as described is 5 H. P. This, however, varies with the same factors that govern the speed. The compressed air used is tapped from the pipe which furnishes air to the percussion drills.

Setting the Carbons.—After every 40 feet of quartz or 150 feet of slate drilled the carbons must be reset. The setting is done by a skilled mechanic whose whole time is occupied in setting bits. One setter is employed by both mines using the drills. The carbons are set in the soft steel bit in such a manner as to protect the inside and outside of the bit from wear. They are not set in each other's path but in a ziz-zag row and are so imbedded that the long edge will revolve in the direction of the revolution of the drill. Care must be taken in caulking the diamonds in place as they are extremely brittle and a chance blow will break them. The stone is about the size of a pea and weighs about three carats. It takes the setter a day to set a bit with six stones.

Recovering Lost Diamonds.—As soon as a stone wears loose it should be removed from the hole immediately. This is done in various ways: First, by increasing the flow of water and washing it out. Second, by using an old bit cut with an irregular groove which is filled with tallow, resin or beeswax. This is lowered in the hole and revolved where the lost diamond will adhere to the wax. Third, by driving a piece of soft pine in an old bit and jamming it against the diamond. If all these methods fail the diamond drill should be crushed rather than be allowed to remain in the hole.

The Samples or Cores.—In a room 15x15 ft., arranged with tiers of 2-inch drawers, the samples are very systematically preserved. These drawers are divided into compartments, in which the cores just as they come from the hole are placed. Each drawer is labeled with date, number of hole, number of level, the shaft, and length of hole. Each time the drill is hoisted a label is placed in the drawer, giving the number of this particular hoist and the number of feet drilled since hoisted, the length of core and total depth of hole. All dust is caught from the wash water and placed in its proper place in the drawer. The driller keeps a book in which he records the kind of rock gone through, speed, number of hoists and places where samples for assay are taken. These samples are given to the assayer, who in turn gives his results, together with the drillers, to the manager. Thus can they plot at any time the direction and value of any streak of ore. Before running a drift to what seems a favorable prospect, several holes are drilled from different points to cross the point in question. Then, if the prospect warrants it, a drift is run.

Cost.—The most expensive items in drilling are the carbons and their settings. The carbons cost about $15 a carat (.206 grains) and six stones of three carats are used to a bit. It costs $10 to set a bit, making a total cost of $280 per bit. The cost per foot of wear and tear on diamonds is 50 cents in hard rock and 25–30 cents average in medium rock. The cost per foot of the 2000–3000 feet drilled last year at the Wildman, including everything, except power, was 64 cents. The drill itself, including 600-foot rods and two bits, costs $2000.

N. B. KNOX.

San Francisco, Sept. 1.

Armor Plate for Battleships.

Discoursing of his recent offer to furnish the United States Government with armor plate for battleships at $100 a ton, J. H. Carpenter, former head of the Carpenter Steel Works, says that it was as much the fault of Government as of the maunfacturers that the cost of armor has been so excessive. The enormous expenditure for the equipment of plants to make nickel-steel plates has rendered it necessary for the companies engaged in the business to charge so heavily. "Both the Bethlehem and Carnegie companies," he says, "now see that they built too expensively. Congress perhaps would have interfered only mildly had it not been for the acceptance of a foreign contract by one of the companies at about half the price that this Government was charged. This led to examinations which exposed the cost of plate, and Congress fixed the price at $300 per ton, which is considered ample to meet all contingencies. I should not have been willing to state my views in detail, only I have made proposals to make plate at such a marked difference in price that it would seem that I believed that the companies are charging exorbitant prices, whereas my views are quite to the contrary. My plan is a revolution from present methods of making steel. The process is pneumatic—that is the use of air is a part of it. Air is used in a new and scientific manner, with results that show a quieting of the usual after reactions in steel, enabling it to be hardened much more readily, uniformly, and with less wastage from blow-holes, spongy centers, and piping, common to the ingots now used in making plates. In my processes the wastage is less than 25 percent, while under the old process it is 60 per cent. By making the plates in sectional thicknesses of hard and soft metal in its molten condition, the results are positive, and the resistance of the plates to projectiles is very materially increased. The conditions of the metal are equal to the best made by the old processes, and this has been already proved in works in Europe."

THE Secretary of the Navy has ordered Lieut. Sargent to make investigation of the various grades of petroleum, with a view to its use as fuel for marine engines. When done he will report to the authorities at the Newport torpedo station, and plans will be drawn for an oil engine, to be placed in one of the new torpedo boats now being built by the Herreshoffs. This will be the first attempt to use petroleum as fuel for the torpedo fleet. Some of the advantages expected from the new fuel are economy of machine space, and, consequently, greater fuel-carrying capacity; economy in the cost of fuel and the ability to develop extremely high steam pressure under forced draught.

Notes on Prospecting.

Written for the MINING AND SCIENTIFIC PRESS by JNO. W. GRAY, E. M.

Alluvial gold-bearing gravels and drifts are, for the most part, formed by the redistribution of auriferous glacial matter, or the disintegration and concentration of landslips from, or the gradual wearing away of, mountainous country containing auriferous veins. It is held by some, however, that all alluvial gold does not come from quartz claims, and that nuggets, properly so-called, and the great pure masses of alluvial gold, have been formed from gold salts in solution, by gradual accretion upon some metallic base. Nuggets, having the characteristics of water-worn gold, can be formed by artificial means, thus giving some foundation to the claim. If this theory be accepted, it is well to reflect that, following up an alluvial lead, no matter how rich, will not inevitably develop a payable lode. Glaciers often carry a small amount of gold intimately distributed throughout their mass. The reassortment and concentration of this material by water collects the gold in the form of placer ground. In some parts of the world rich alluvial deposits have been formed in this way, and no payable veins have yet been found above or around them. The wearing away of a great mass of country containing auriferous veins may result in the formation of rich placers, and yet not one of the veins supplying the gold prove, when found, to be rich enough to work.

If fine gold is found in the sands of rivers or streams, heavier gold will probably be found above, and farther up yet coarse gold and nuggets may occur, and these may suggest the locality of the source. Water washing away gold-bearing matter drops first the heavier particles, carrying the lighter down. The richer deposits are likely to be found where the streams change direction or fall. Mining in some of the ancient river channels of California has disclosed the gold above holes and depressions. The grade of the channel being heavy, pay has been found in the wide portions, on the sides, and the inner rim of curves. When the fall is light, pay is most likely to be found in the reaches of somewhat strong flow.

When gold is found in streams or gulches, terraces or accumulations of gravel may occur on the sides of the slopes, sometime high up. These should be examined, since they are often gold-bearing, containing rich layers and runs of gold. When the gravel is loose and broken, the gold is apt to be found near the bottom, mixed with clay and earthy matter.

Shallow deposits on hillsides and in valleys often are rich in gold, and the mixture of sand, soil, clay, earth and gravel constituting these should not be overlooked, but carefully prospected. Do not let an accumulation of moss, leaves, brush, etc., deter from making a pan trial. Gold is often found at the grass roots and when least expected. Remember the saying, "Gold is where it is." Unfortunately, this is too often where the prospector is not.

It must be borne in mind that the existing course of gold-bearing streams is not always an indication that the original gold gravels or drifts follow the same course. Ancient channels and glacial drifts often appear to have been at an angle to the present streams. Channels rich below, are frequently almost barren above the points where they cut away, intersect, or cross, the principal formation supplying the gold. An illustration of the above is given in this State by the "Blue Lead," which has been cut through and disclosed to view at various places by the streams heading in the Sierras and flowing westerly to the sea. The fact above mentioned has often proven a source of trouble to miners. Leads were supposed to follow the course of the stream whereas the true leads, in many instances, went right across their course, and were found again by accident and by inexperienced diggers.

Prospecting for alluvial gold, at shallow depths, is simple, since the gold is usually found at or near the surface, and then traced to deeper leads if any exist. To find and follow deep leads or ancient channels covered by volcanic or diluvial action is an undertaking of magnitude. Often a careful study of the geological environment and the conditions governing the present shape of the country, is necessary, requiring to be followed by much underground exploration work. The bedrock of alluvial deposits especially if seamy and of a soft character, is often rich in gold for a considerable depth. Clay supposed to contain gold should be closely examined and washed with unusual care.

No special directions are necessary for preliminary alluvial pospecting. The appliances needed are pick, shovel and pan. The inexperienced soon become skillful in panning dirt, and with a little exercise of common sense soon learn to estimate approximate gold values. A grain of pure gold is worth a little less than four and a third cents. The average value of gold from many placers in the United States is about three and three-quarter cents per grain. In Alaska and the Northwest Territory some of the gold is said to be of much less value. It can generally be determined, once for all by assay for a given lead. About one and one-half yards of gravel when dug is equal to one yard before being dug. Several average pans of dirt can be measured and the number to the yard thus determined. It is easy then to approximate the value of the gravel per yard in place. For exact data, the volume of a yard of gravel in place, after being dug, should be determined for the deposit being prospected. The smaller sized pans are often most convenient, since the load is lighter and they can be more easily handled.

The prospector should carefully observe the materials of the deposit he may be testing, and study its peculiarities. The knowledge thus gained is often of immense service in tracing the run of leads, and recognizing them when found again. In sinking shafts for testing purposes energy should not be wasted in making them too large. Two and one-half by four feet is large enough for considerable depths.

When alluvial gold is found in a region, it is probable that gold-bearing lodes exist somewhere about, and the surrounding country should be carefully prospected for auriferous veins. The search for mineral veins is conducted in much the same way in all similar regions, but the prospector is wise who gives some little thought to the best manner of setting about this work.

The better localities for the occurrence of mineral deposits are at or near the junction of the older sedimentary formations, slates, shales, schists, quartzites, sandstones, limestones, etc., with the igneous rocks. Igneous rocks are those thrown up from the melted interior of the earth. Sedimentary rocks are those formed by the washing down and deposition of the older rocks. When altered by heat or pressure, these latter rocks are called metamorphic rocks. All the prospector has to do, however, is to bear in mind the difference between the two kinds of rocks, igneous and sedimentary.

Good veins are often found on the line between two different rocks. These are contact veins. Recent formations and modern volcanic rocks are not considered worth prospecting, and in great formations of igneous rock the chance of good veins occurring is small, unless the formation is cut or intersected by dikes of porphyry or similar rocks. Look out for dikes of porphyry, diorite, etc., in and among the formations above mentioned. They are always good signs, and the region of their occurrence should be carefully examined.

The search for lodes, if the country is exposed, is not difficult. The prospecting may be done upon the hills and ridges, since there the outcrops are usually better seen, and the veins can be traced to lower ground by their strikes. Sometimes, in a grass-covered country, a vein may be located and traced by a track where the grass appears more withered than elsewhere. The quartz lode is close to the surface, and there is no soil to make the grass grow well. The outcrop, once found, can be followed along the strike of the lode and sampled at frequent intervals to determine the best portion of the vein as exposed. It must be remembered that, in a rough country, where the lode strikes across hills and valleys, the line of outcrop will appear crooked or curved. The true direction of strike must be determined upon a flat, level stretch.

The appliances for prospecting gold lodes are also the pick, shovel and pan, but, in addition, a mortar and pestle will be needed, and a magnifying glass and a fine screen are good to have. An iron quicksilver flask cut in half will make a mortar, and a piece of drill steel with smooth and hardened end will answer for the pestle. It is often better to burn the stone before crushing it for the pan. This makes it more likely that the gold will be revealed in the panning operation.

The crushed sample should be passed through the screen and then panned, as for alluvial gold, except that more care must be used, as the gold is usually finer. For close tests the sample should be dried, then weighed or measured before crushing and panning, so as to be able to approximate the value of the ore per ton. Quartz can be estimated at 13 cubic feet to the ton in place, or 20 cubic feet to the ton when broken to ordinary fineness. When without the appliances for weighing, one can only guess the amount of metal obtained. Some miners become rather skillful at this, but it is better to have a small balance, with grain weights. By weighing the gold obtained from a given amount of ore panned out, somewhat reliable information may be obtained as to the value of the find. Prospectors often deceive themselves by panning out selected stone, instead of average samples. They often think they pan out much less material than they really do, and novices always imagine the amount of gold obtained to be much greater than it actually is. These mistakes should be avoided.

If the country be not exposed, notice the cuttings (if there be any), landslips, cliffs, water courses, dry channels and gorges. If float stone or gold occur, follow it up until no more is found, then look to the hillside for the vein formation. At the base of the slope float occurs, or gold is found by panning earth and gravel dug from the slope. This is done each way along the slope, until no more float or gold is found. From the middle of the line thus determined work up the hill, searching for float and panning as you go, until no more is found. Dig or drive into the hill here for the ledge. Remember that, if the hill is rounded outwards, the float and wash gold are spread out as it works down, while if the hill is rounded inwards, float and gold are confined to a narrow portion of the slope. If it be a gulch, the float and gold will be found mostly at the bottom, the latter principally where holes are naturally formed. If float is found at the foot of a hill, the source will generally be found somewhere on that hill.

Where the country is covered with a dense brush, with a depth of soil, and a surface of moss, leaves and decayed underbrush, it becomes much more laborious to trace loose lode stuff to its source. Often trenches, drives and shallow shafts are necessary. Or the process called "loaming" may be employed. The prospector, at likely looking places, digs down to the rock and takes a sample, marking the spot and correspondingly marking the sample. He collects many samples in this way from different places, takes them to the water and pans them off. If gold is found, he is on the right track. He returns to the spot where he took his samples, and in like manner traces the gold up the hill, until the loam gives no prospect, and there sinking is commenced and the hidden vein disclosed. The vein, when found, is followed and sampled as above described. Gold that is flat, lenticular and worn has probably traveled; if porous and with gangue attached, it is vein gold. As the vein is approached the gold float stone will become more angular and less worn. The float stone should be "kindly rock," such as is known to compose the matrix of veins. The usual matrices are quartz, calc spar, fluor spar, and heavy spar, but the almost universal matrix of veins, particularly of gold lodes, is quartz. This is, therefore, the rock that should be chiefly sought for. Frequently pieces of quartz, broken away from a vein, are honeycombed and colored yellow, red or brown by iron oxide. This is called "gossan," and is a most promising indication. Never pass an ironstone blowout without careful examination and testing. Gold is distinguished from iron and copper pyrites and yellow mica by being soft and malleable. A steel point will prick gold, but will glance off iron, or only scratch the other minerals. Pyrites of iron and copper are often rich in gold, and ore containing them should be carefully tested by assay for the precious metal.

Other metals besides gold may well command the attention of the prospector, such as silver, copper, lead, mercury, tin, etc. These metals are all very valuable in themselves, and many of the ores of the first three are often rich in gold.

Ores of silver occur in various rocks, porphyry, trap, sandstone, limestone and shales, and are found along with those of lead, copper, antimony and zinc. The gangue is usually quartz, calc spar and fluor spar and heavy spar. Prospectors, by observation, soon learn to recognize the more common and valuable ores of silver. They are heavy, and pure specimens of some of the richest ores are soft and can be easily cut with a knife. A rough test is to heat a piece of ore and plunge it into water. The metal comes to the surface in drops. Other metals may possibly appear and be taken for silver, but in any event the test indicates the presence of metals that deserve the notice of the prospector. Silver is a white metal. It can be hammered out and cut with a knife, and occurs native in irregular shapes and in masses.

Ores of copper occur in rocks of many kinds and in both lodes and deposits. As a rule, they are easy to distinguish, on account of their bright colors—brown, yellow, red, blue, green. The ores are heavy and can usually be cut with a knife, unless iron is present in considerable quantity. Copper occurs native in irregular, fanciful shapes and masses. It is a red metal and can be hammered out. A rough test for copper in ores is to roast the piece and drop it hot into some grease. Expose it to a flame, and a green color will appear if copper is present. Gossan on the outcrop is good for copper.

Ores of lead occur in granite, limestone, sandstone, argillaceous rocks, etc. The principal ores are galena and carbonate, and they are often rich in silver. Galena, once seen, is easily recognized again; but the carbonate, when broken up and fine, appears like clay or earth and is distinguished only by weight and actual test. Fluor spar in the gangue is favorable for lead. The ores of lead are soft and easily melted. Lead is rarely found native.

The chief ore of mercury (quicksilver) is cinnabar. It is a red to brown ore, with scarlet red powder or streak. It is easily recognized when often seen. It occurs in connection with slates, shales, serpentine, sandstone, etc., but seems to have a preference for sandstone. If crushed ore be placed with lime in an iron pan and heated, a drop of quicksilver will be found at the bottom. Mercury is easily vaporized by heat; and a gold coin, placed in the fumes, will soon have a coat of quicksilver. Quicksilver is a heavy liquid metal, with a tin white color. It occurs native in cracks and holes in rocks and also alloyed with silver.

Tinstone is the great ore of tin, and occurs as lode and alluvial or stream tin. It occurs of various shapes and of different colors, and is not always easy

to identify. Lodes of tinstone are found in or near granite with white mica. This ore is at times washed down and left in beds of gravel debris. The courses of such deposits are called "streams," and the rolled fragments of tinstone therein are called stream tin. It is blackish in color, and occurs as fine sand, coarse grains and pebbles. It is often associated with alluvial gold. By scratching the tinstone, or crushing to powder, the "streak" is obtained. It is whitey-gray, and, once seen, is not easily mistaken.

The alert prospector will also be quick to observe indications of coal. Everyone will recognize coal in its common forms. It occurs in extensive layers and beds along with different rock strata. The rocks are usually shales and sandstones, and the sandstones are often coarse grit rock or conglomerates. There are sometimes beds of limestone with the other deposits. Coal is a very valuable material and good beds, well located are better than gold mines.

A certain amount of technical information, a knowledge of rocks, the locality of occurrence of the more valuable minerals, their appearance, and simple modes of testing them, are of service to the would-be prospector, but the necessity of this learning is by no means great. A bright prospector soon learns to trace out and discover mineral deposits. As explained above, he can easily learn to make approximate estimates of gold values. By a little patience and observation, he can learn to recognize the common rocks, and the useful ores of the more valuable minerals. If he is wise, he will carefully take average samples of the ores he finds, and have them tested by a competent and reliable assayer. It is well to have some selected samples tested. Many ores are payable when sorted, when otherwise they would not be so. Probably the most important thing for a prospector to learn is how to properly sample a find for a correct determination of its value. As a matter of fact, this is about the last thing he learns to do and his want of care in this respect often results in expense and disappointment. Many of the best finds have been made more or less by accident, and by persons with little knowledge of mining. This would seem to prove that technical knowledge is not essential to success. Health, strength, courage, ability to stand fatigue and hardship when necessary, a cheerful, even temper, and a patient hopeful disposition are more important essentials and more conducive to the success of the prospector.

Artificial Production of Diamonds.

Prof. Wm. Crookes gave the following interesting references to the probable origin of the diamond, and the efforts hitherto made to produce it artificially, in a recent lecture at the Royal Institution in London.

The lecturer stated that speculations as to the probable origin of the diamond have been greatly forwarded of late years by improved means of obtaining high temparatures; and through the successful experiments of Moissan, microscopic diamonds have been made in the laboratory. He had provided a most powerful dynamo, especially made for the purpose, weighing 4½ tons, and when driven by a 50 to 75 horse-power engine generating a current in the electrical furnace of 700 to 800 amperes at 70 volts, yielding a heat of from 3,500 to 5,000° C. In the process of making diamonds, the first necessity was to select pure iron and to pack it in a crucible with pure charcoal from sugar. Half a pound of this iron was then put into the body of the electric furnace and the arc formed close above it to utilize the electrical current passing through it. The iron rapidly melts and saturates itself with the carbon. After a few minutes it is heated above 4,000°—a temperature at which the lime of the furnace melts and volatilizes. The current is then stopped, and the crucible is plunged beneath the surface of cold water, where it is held until it diminishes to a dull-red heat. The sudden cooling process solidifies the outer layer of iron, and holds the inner molten mass in a tight grip. The expansion of the inner liquid in solidifying produces an enormous pressure, and the dissolved carbon separates out in a transparent dense crystalline form—in fact, as diamond. Then commences the more tedious part of the process, the attacking the metallic mass with solvents to liberate the diamonds, the crystals of graphitic oxide, carbonado and bort—the cleansing operations being repeated until all the well-washed grains are collected and examined under the microscope. The laboratory diamonds burn in the air before the blow-pipe into carbonic acid, and in luster, crystalline form, optical properties, density and hardness are identical with the natural stones. Many circumstances, he pointed out, led to the conclusion that the diamond of the chemist and the diamond of the mine are akin as to origin, and that the diamond genesis must have taken place at great depths, under enormous pressure. Molten iron could have held the carbon in solution, and all the varieties of carbon crystals, and even the different tints of diamonds from various mines and geographical areas, could be accounted for on this theory. It is certain, from observations made at Kimberley, corroborated by the experience gained in the laboratory, that iron at a high temperature and under great pressure will act as the long-sought solvent for carbon, and will allow it to crystallize out in the form of diamond—conditions existent at great depths below the surface of the earth. But it is also certain, from the evidence afforded by the Arizona and other meteorites, that similar conditions have likewise existed among bodies in space.

Development of Lake Superior Iron Ores.*

By D. H. Bacon.

During the late fifties the ore product of Lake Superior was handled over a mule tramroad to Marquette. Now the Duluth, South Shore & Atlantic; the Chicago & Northwestern; the Wisconsin Central; the Duluth; Superior & Western; the Duluth, Mesabi & Northern; the Duluth & Iron Range; and the Lake Superior & Ishpeming railroads serve the shippers. Up to nearly 1870 a 700-ton ship was an enormous craft, the loading of which required two days, the unloading being seldom accomplished in that time. Now the cargoes reach 5000 tons, the loading requiring less than three hours, and the unloading ten hours. In 1871 the largest ore barge carried 1050 tons and made twelve trips per season. Now the mines cover more land than was familiar to even the timber cruiser when the Jackson mine was opened. The annual shipments have grown from a few thousands to 10,000,000 tons, and the ability of the mines to produce is not taxed. Lake freights are one-eighth of early prices and rail freights one-quarter.

The deeper waterways, commodious locks and large ships of to-day are in a greater measure due to the movement of ore than to any other cause. Great savings have been made in each detail of each department. The only cost that has not been lessened, I am glad to say, is the cost for money paid to men, for wages, measured by what they will buy, are as high now as at any time past, except it were one of feverish activity.

As illustrating the cheapening that has been effected, ore is to-day sold at Lake Erie ports for $1 per ton less than in early times it actually cost to mine, and this is done without loss. And further economies may be expected. Young men remember sales of ore in Pittsburg at $18 per ton, or about the present price of rails.

The first mines were opened in Marquette county, and were of what is commonly known as "hard ore." Previous to 1873 soft ore, or "hematite," was not popular, but the buyer was often obliged to take some in order to secure the needed quantity of hard ore. In those good old days the ore buyers came to the sellers as penitents approach the shrine, but I am told that custom in this respect has changed somewhat of late.

Beginning with a few grades, the Lake Superior mines now offer ores from the purest and best to those that will not bear transportation, and within these limits can be found the varieties needed for general or special products, and in quantity equal to any demand. The men who were early in charge of the mines had some knowledge of mining and quarrying. Many of their methods are now out of date; but experience, daily observation and study, technical schools and the mechanical ability so common with Americans have enabled those in charge to meet all difficulties and to carry the industry to a point that is complimented by visitors from abroad. In the discovery of new fields the miner of iron ore, like the miner of more precious metals, has led the way, the explanation of the geology being left to the student. As viewed from this distance, the early methods were very crude. Horses furnished the power, and they were worked in all possible and some almost impossible places. The little machinery then in use was poor and often but ill adapted to the work. The first hoisting plant of large size, economical design and equal to future demands was set up at the Lake Superior mine in 1880. Not single, compound, triple and condensing engines of large power are found throughout the iron ranges for hoisting, pumping and compressing. The hammer has been supplanted by the power drill, and electric motors and rope haulage are common above and below ground. Underhand, back and breast sloping, square sets, caving sets, saddle backs and milling and filling are common. Steam shovels and locomotives have taken the place of shovels and carts. Every known system has been or is in use. Many mines have presented difficulties that in the early days would have been considered insurmountable, but each has been overcome.

To one closely identified with this industry for nearly thirty years, no single change has seemed important, and only by looking backward can one measure the advance. The early operators had little knowledge of ore deposits, their position in relation to associate rocks, their dip, pitch, strike, depth and many other facts, an understanding of which is necessary to continued success. This knowledge has been acquired, and with it have come right, courage, true economy instead of parsimony, the general development of ore supplies far beyond immediate needs and a thoughtful preparation for the future.

Nitro-glycerine and power drills have done more to reduce cost than any other two changes. In 1871 a drift was driven at the Cleveland mine at a cost of $100 per foot. Now the cost would not exceed $16. In one case men were harnessed to a derrick sweep. Heavy rains were nearly always followed by a few days of idleness, and the pumps were expected to freeze every cold night.

In speaking of mining methods, the "caving system" was mentioned, which several claim to have invented or introduced. The first ore taken out by this method was mined at the Cleveland Hematite in 1883. The ore was very soft, with treacherous walls, and G. W. Wallace, the superintendent, tried what some of his men said was successful under like conditions in England. It proved satisfactory and is now known as the "caving system." John Pengilly was sent to the Cleveland Hematite to learn the method so that he might use it at the Brotherton mine.

*From a paper read before the American Institute of Mining Engineers, Lake Superior meeting, Tower, Minn., July, 1897.

A DEFINITE IDEA of the present standing of alchemy in America is given by Dr. H. C. Bolton in the London *Chemical News*. Two claims to success in creating gold are deemed worthy of mention on account of the boldness, persistence and apparent scientific basis with which they have been urged. The claim of Dr. G. H. Emmons was first advanced in August, 1896, and in July of this year it was stated that nearly $1000 worth of an alloy of gold and silver, which had been produced from Mexican dollars, had been sold to the United States assay office, the profit on such manufacture being at least $3 per ounce. It was predicted that the production would reach 50,000 ounces within a year. Dr. Emmons affirms that his work had its origin in an investigation of nickel steel in 1892, when evidence of a new substance appeared, and, acting on a suggestion from Mr. Carey Lea's work on the allopathic forms of silver, he made a more minute subdivision of silver than Mr. Lea obtained, and compressed this in a new apparatus of great power. The result is a substance—called Argentaurum—with greater density than silver and the appearance and properties of ordinary gold. The chief source of expense, in the words of Dr. Emmons, "is the time required for bringing about the desired molecular changes." The second process for transmutation is claimed by Mr. Edward C. Brice of Chicago, whose operations seem to have been begun in New York about three years ago, and to have continued with numerous victims—although his Chicago plant is still declared a financial success. A patent was applied for last May, and twice refused. The application being pressed, an elaborate test of the process was made by the patent office, with no results except partially to recover the small percentage of gold contained in commercial antimony.

Kelvin on Fuel and Air Supply.

Lord Kelvin, in his recent address before the British Association at Toronto, gave some estimates on the available fuel supply of the world and made some suggestions which attract attention. He thinks that the utilization of water powers to the greatest extent will diminish only insignificantly the tax on the world's supply of fuel, and believes that the cultivation of vegetation which adds to the store of oxygen is of more importance than anything else man can do to prolong human life on the earth. He estimates that there exists 510,000,000 million tons of oxygen that will burn 340,000,000 million tons of fuel, but the diminution of the oxygen will destroy human life long before its supply gives out, so that the fuel that may be left after the race dies is of no avail. There are 200,000 tons of fuel for each person living to-day, which, he says, will limit the life of the race to a comparatively short span. But the growth of vegetation will be necessary to sustain life to this limit. Lord Kelvin calculates that the power now developed from the turbines at Niagara is only equivalent to the requirements of about ten ocean liners, and if the entire force of the mighty stream should be utilized it would only be equal to the power of 100 of these ships.

Amending Federal Mining Laws.

TO THE EDITOR:—An article in the PRESS of the 21st ult., entitled "American Federal Mining Laws," has attracted my attention. The three propositions by Mr. Keyes are, with slight modifications, identical with some contained in the Mexican mining code of 1892. It is high time that the extra lateral right incubus should be forever banished from our Federal mining laws. It has cost treasures of money and caused no end of bad blood and often the loss of life. Here in Mexico we never have any trouble or law suits upon that score. Not having the time to enter as fully into this question as its importance demands, I would advise the members of the International Gold Mining Convention to procure a copy of the Mexican mining laws of '92 and study them closely. They will get points from them that may be of great benefit both to themselves and others.

AUG. SAHLBERG, Superintendent.

Esperanza mine, El Oro, Mexico, Sept. 1.

How They "Boom" in London.

It has often been said that the Americans of the west are past masters in the art of booming, and that no one can approach them in this line; but I am inclined to think that the Westralian folks in London have beaten the record; for never have I heard of the chief executive of a state being called upon to make a public speech to boom a mining section. But this is just what occured this afternoon in the Great hall, in the Cannon street hotel, London.

A big meeting was held, it having been publicly advertised, under the auspices of the West Australian Chamber of Mines, and presided over by Lord Castletown of Upper Ossory, supported by other lords, and other mining men. The hall was packed to the doors, and not a little interest was manifested in the proceedings.

The lion of the event was, as suggested above, the Rt. Hon. Sir John Forrest, premier of the West Australia, who (as the advertisements said) had "consented to address" the meeting. He said that his subject would be West Australia as a gold producing country. There are other products of the colony, but he dealt only with the gold industry. The extent of the auriferous district, he said, is over 1,000 miles, from the southern to the northern gold fields. The gold output for the past years has been somewhat as follows: 1886 £1,147; 1890, £8,664; 1893, £421,385; 1896, £1,068,808, and for the first six months of 1897, £1,008.253. He prophesied that the year 1897 would show an output of £2,000,000, while the total output since the opening up of the country has been £4,685,000.

The premier mentioned several of the mines that have done well, and among others spoke of one that has paid 6 shillings per annum dividends, the shares being now quoted at only £1. He mentioned, of course, quite casually, that he has some shares in that company! This should be a good pointer! The government has abolished all duties that in any way would tend to harm the gold industry.

He spoke about the money to be made by "staking" prospectors and said that he himself had done well in this line; for in one case he staked a prospector to the tune of £100, and his returns amounted to the neat sum of £8,000. As to the land laws he told his hearers that an immigrant can get 160 acres of land free, and more than that the government will lend him some money to help him clear the land, if he needs it. The population of the colony is 160,000, and the revenue last year amounted to £2,864,750. There are 1,500 miles of railroad in the colony, much of it belonging to the government.

The meeting was quite enthusiastic; there being quite a large contingent of Westralian mining men and brokers, who led off in the applause and hear, heared all the boom points.

Surely this is a smooth way of booming a gold field, and we shall next expect the premier of British Columbia to take the stand, and give a boost for the War Eagle and the Le Roi, and then perhaps we can get Governor Adams and Mr. Smith to come across and give a few brief utterances on the glories of Cripple Creek and Telluride, and the greatness of Butte and the Mayflower group. I hope that if they do so, they will omit to name the companies in which they "have a few shares," as though that is quite pardonable in a British premier of title, it would be an unpardonable sin in an American, and would at once be put down as an example of Yankee brag! London Corr. Colorado Critic.

THE ascent by Prince Luigi of Mt. St. Elias has demonstrated two facts of prime importance to the scientific world. It fixed the altitude of the mountain at 18,120 feet, and proved St. Elias was never a great volcano. A new glacier was discovered by the explorers, between the Augusta mountains and Great Logan. It takes its course apparently to the sea, and was named by the prince, Colombo.

Scientific Progress.

Hydraulic Blasting.

A meeting of the Manchester Geological Society is reported in *Industries and Iron*, at which a new hydraulic apparatus for breaking down coal in mines was discussed. Mr. James Tonge, who described the apparatus, called attention to the great danger attending the ordinary method of blasting in coal mines, and said that the numerous serious accidents from this cause had led the inventors to look for a safer process of loosening the coal. The new apparatus consists of a hydraulic cartridge, 18 inches in length and 3 inches in diameter and weighing thirty pounds and a small but powerful hand pump fitted with a pressure gauge weighing about twenty pounds. The mode of using it is as follows: The coal is holed underneath the usual depth, and a hole drilled near the roof to about the same depth as the holing, in the same way as for blasting. After this the cartridge is placed in the hole and pushed to the back. No "stemming" is required. The pump is coupled to the cartridge, the suction pipe is placed in a small bottle of water, and work commences. Very soon the gauge begins to show the rising pressure—half a ton, a ton, a ton and a half, two tons to the square inch. During this time a cracking sound is heard, indicating the shearing off of the coal at the back. The gradual way in which the work is done, without shock or jar of any kind, prevents even the least damage to coal or roof, in striking contrast to the action of explosives. The time occupied is an important matter. It has so far been about twelve minutes. This time includes placing the cartridge in the hole, connecting to the pump, getting down the coal, withdrawing the cartridge from the hole, and getting to the next place. The advantages claimed for this process over the ordinary blasting are (1) larger and stronger coal, which means a better average price; (2) non-interference with the working of the pit; the coal being got down whenever required; (3) no damage to roof; (4) no dust; (5) and absolute safety from the dangers attending shot firing. In previous machines of this sort trouble has been had with the joints, but it is stated that this one is free from that fault.

Economy of the Gas Engine.

At a recent meeting of the North British Association of Gas Managers, one of the papers presented gave the following in reference to the use of gas engines in Dunferline:

In the year 1896-7 there were twenty-two engines in the town, the average size being 3.27 nominal horse power, and the average consumption being 78,632 cubic feet per engine.

The best result in Dunferline was in the case of an 8 nominal H. P. engine, which, with a steadily increasing load, repeatedly consumed 3900 cubic feet in twenty-four hours' work, equal to 20.31 cubic feet of gas per nominal horse power hour, and as the brake horse power employed probably averaged not less than 12 H. P. during the whole period, the consumption of gas-brake horse power equaled about 13.54 cubic feet. This result will be sufficient to explain the reason why it is so difficult to introduce town's gas in Dunferline for power purposes. It is a poor steam engine which consumes eight pounds of coal per brake horse power hour, and yet with this large waste of fuel 3.89 brake horse power per hour are obtained for the cost of one penny for coal, as compared with 2.11 brake horse power per hour as obtained for one pennyworth of gas. Still, allowing for the lesser attendance which is necessary with gas engines as compared with steam engines, in small works, where the load is constantly varying, it is considered that, with gas at 3s per 1000 cubic feet, a gas engine of the most efficient type is the more economical motor.

THE use of compressed air is now so established and so extensive that an organization entitled the Compressed Air Makers of America has now come into existence. The members at present consist of men employed or to be employed in the caissons of the new East river bridge to connect New York and Brooklyn. A schedule of wages has been established, varying with the depth or pressure, as follows: From 55 to 70 feet depth, $2.75 for six hours' work; from 70 to 80 feet depth, $3 and four hours' work; 80 to 90 feet depth, $3.25 and two hours' work; from 90 to 100 feet depth, $3.50 and one hour and twenty minutes' work.

IT is of scientific interest and practical importance to determine the conditions resulting in the maximum attractive power of the electro-magnet. Wilde has exceeded his own estimated limit of 400 pounds per square inch for magnetic tractions by means of annealed charcoal iron wire 0.57 inch in diameter. The electro-magnet was excited by a current of 40 amperes. With a piece of wire 1.2 inches long the unprecedented tractive force of 422 pounds per square inch was obtained. That the magnetization limit was virtually arrived at was shown from the fact that, when the current transmitted round the electro-magnet was reduced from 40 to 26 amperes, the amount of the tractive force remained constant. The determinations were made with a single pole electro-magnet.

THE survey of the boundary line between Nevada and California begun in 1893 on an appropriation of $300,000 secured by Representative Caminetti of California, is nearly completed. About $2000 of the fund remains, which is being devoted to the correction of a few mistakes in triangulation work. Surveyors Sinclair and Boyce are now on Freehill's peak, near Bijou, Lake Tahoe, and Surveyor Baldwin is in the Como mountains. The first-named will be on Mount Davidson this week. The new line varies little from the Von Schmidt line of 1873, Nevada losing a little near Lake Tahoe and gaining slightly at other points.

THE appointment of a committee to investigate the condition of the Coast and Geodetic Survey has resulted in the presentation of a report which will not be made public. It is understood, however, that it has been practically decided that a successor to the present director of the Survey will be appointed, and that the selection will be made without reference to political consideration and on the grounds of scientific standing. In this case the name of Professor Geo. Davidson of this city of course suggests itself before that of any other.

EXPERIMENTS made by M. d'Arsonval with an instrument which he calls the myophone proves, contrary to the older opinion, that nervous excitability may exist for many hours after death. The old test of the muscle shortening is, no doubt, not applicable long after death has departed; but, as the sound given out by the myophone proves, the death of a nerve is much less rapid than has been hitherto supposed, and a nerve may act on a muscle, in a state of electric excitability, without producing more than simple molecular vibration.

FOR the removal of oxygen, sulphur, etc., from molten metals, as cast iron, steel, copper, bronze, nickel and aluminum, J. L. Gauharou of Paris recommends the addition of carbide of soda, which, combining with the impurities, forms oxide, sulphide, or sulphate of soda, which can be separated easily and perfectly from the refined metal.

AN iron ship weighs 27 per cent less than a wooden one, and will carry 115 tons of cargo for every 100 tons carried by a wooden ship of the same dimensions, both loaded to the same draught of water.

A NEW machine, invented by Prof. Dwight of Vassar College, is said to slice rock to the thickness of one-fiftieth of an inch. This is accomplished by means of a series of tin disks with edges charged with diamond dust.

Mechanical Progress.

Breaking Up Old Boilers.

Frequently two or three old boilers are seen lying around a manufactory awaiting some market for their disposal. A complete boiler is an object little desired by the junk men; were it broken up into sheets and tubes he would readily make a bid for the whole. The breaking up of a large boiler is a job to be dreaded by a man who does not understand the business, but he who "has been there" knows that a couple of laborers armed with slight hammers and cold chisels, together with the requisite "know how," can reduce that huge boiler shell into a pile of scrap iron in a few days' time. It is not hard to remove the rivet from an old boiler; all that is necessary is a sledge hammer with a good square corner and a few blows driven with precision upon one side of the rivet head will break it off as cleanly as though cut by a chisel. Probably fifteen or twenty blows will be necessary to each rivet, and they must be delivered exactly, no unfair striking being allowed in this matter, or the rivet will not break. The work can be furthered by the application of a cold chisel, shaped a good deal like a caulking tool—that is, ground straight on one side, with all the bevel on the other side. This tool is fitted to a handle so as to be held by one man and operated upon by the other man with a sledge hammer. Two days' work by two stout men, armed and equipped as above, will go far towards demolishing a large boiler.

In Boston there are two men who make a business of breaking up old boilers, doing it by the job. In looking over the "graveyard" of a second-hand dealer in boilers, as some engineers call the storehouse of these dealers, the writer observed quite a number of the old boilers and inquired whether they were to be sold. The dealer replied that they would be broken up as soon as Blank brothers could get around to it. "We never break up the boilers ourselves; no one does; our men could not earn half a day's pay at the work. Those two men make a business of it and will go through a boiler in one-fifth the time two of my best boiler makers could do it, and make good pay at it and always have plenty to do. When I want boilers broken up I always wait until they can get around to do it."

A PROMOTER is said to be doing a good business in some small towns at the expense of the mill owners. His scheme is to induce the town council to grant him a charter to furnish electric lights for the streets, dwellings and stores. He then induces a number to agree to take lights, and he installs the plant in the local mill or elevator. As soon as it is running nicely he sells out to the local miller or elevator man, and according to his own story he is "making all kinds of money," at the expense, of course, of the man he sells to. In the first place, there is no necessity for a miller to give a good profit to a promoter for what he can easily do himself, and, worst of all, it is extreme folly to pay a schemer five prices for a poor plant, when he can get a good and well equipped plant of reliable manufacturers, who will make defects good, for one price. If there is an opening for an electric light plant in his own town, the miller should prepare to supply it. He has the power plant and generally plenty of room to spare, so he can establish an electric light station at a comparatively small cost. The operation of it is not likely to discommode him or interfere with the milling business in the least. If the miller is disposed to go into the electric light business, he should do the promoting himself.

RAIN cannot force itself under the bottom of a door or window frame just patented which has a flange in the bottom of the frame with the front of the

step lower than the back, the door being beveled to fit it tightly.

Loading by Electricity.

A few years ago the idea of loading a ship with 2500 tons of flour in twenty-four hours by means of two small motors would have been looked upon as absurd. This was done recently in Tacoma, Wash. Two thousand tons of cargo have frequently been loaded or unloaded in a day by steam power, but the important factor in the record breaking achievement at Tacoma was that the conveyor was worked by electricity. With the apparatus which has been designed for the purpose, flour and grain can be loaded at any stage of the tide and independently of the weather. If it should rain, a canvas is quickly spread from the door of the warehouse to the ship's hatch. With the system of loading ordinarily used eighteen men are required to do the work of one electric conveyor, with which the bags are delivered into the ship's hold at the rate of 2500 to 2700 pounds a minute, or 75 tons an hour. When extra speed is desired two conveyors are employed. This was done when the record of 2500 tons in twenty-four hours was made. The electric conveyor is 40 feet long. It is moved at will on two wheels in the center. A 2 H. P. motor supplies the power, the current being taken from the nearest electric wires. The sacks are placed on a revolving belt of rubber, which passes over twelve rollers. The belt is propelled by a driving wheel attached to the side of the apparatus. The rolls are placed close together and the belt revolves at sufficient speed to carry all the weight in flour or grain that can be placed upon it. The conveyor works as well when placed at an angle of 45° as when on a level.

Electrical Progress.

Utilizing Water Power.

Those who are developing the natural resources of this coast, Central and South America readily see the uses to which water power can be put in the generation of electricity. Coal is expensive in these latitudes and makes the cost of supplying power by means of steam greater than that of utilizing water. Of the output of one electric company, 40 per cent of that which goes to the countries south of us is for use in connection with water power. In most instances the power generated is used on the spot, long transmission being rare. Among the cities which use electricity derived from water fall are Escuintla, Guatemala; San Salvador; San Miguel and Chihuahua, Mexico; San Gil, Colombia, and San Christobal, Venezuela.

The Electric Power Transmission Company at Pachuca, Mexico, develops 3300 H. P. and transmits it nineteen miles for power, mining and light. The San Rafael paper mills at Ameca, Mexico, get 750 H. P., and for Puebla, Mexico, the Puebla Lighting Company generates 965 H. P. and sends it nine miles to the city.

One electric company is constructing for the Jalapa Electric Light Company a plant which develops 800 H. P. and carries it eight miles to Jalapa. The same company has installed a 400 H. P. plant for the Mazipal Copper Company of Conception del Oro, Mexico. The line is seven miles long. The Compania de Alumbrado Electrico of San Salvador gets 320 H. P. from a point seven miles distant. Percy Burbank generates 150 H. P. five miles from Lima, Peru, and sends it into that city for light and power. In the Argentine Republic the Cordova Light and Power Company develops 5000 H. P. and sends it sixteen miles into the city of Cordova.

European countries do not seem to have taken hold of the generation of electricity by water power with the energy the New World has shown. Up to 1894 the largest amount of power produced electrically from water flow was 3000 H. P., generated at the falls of Tivoli, Italy, and transmitted seventeen miles to light Rome.

Work at Rhinefelden, on the upper Rhine, is going on; 15,000 H. P. will be developed by means of twenty turbines. Ten thousand H. P. will be used in electric chemical industries and the rest in lighting.

The Bakersfield, Cal., Transmission.

The electrical transmission plant of the Power Development Company at Bakersfield, Cal., which recently received extended illustrated notice herein, is the subject of an excellent article in the current issue of the *Journal of Electricity*, in which, speaking of the apparatus, is said:

Dr. Cary T. Hutchinson, of the firm of Sprague, Duncan & Hutchinson of New York, who was selected as the consulting electrical engineer of the Power Development Company, made an exhaustive test of the apparatus used before its shipment from Schenectady, and this being the first report by a competent and disinterested engineer on the efficiency and characteristics of this type of transmission apparatus available, is here published in its essential features for the first time. The measurement of the general efficiency included the mechanical power delivered to the exciter, the efficiency of which was found to be 80 per cent. The commercial efficiencies of the generator were found to be as follows:

Full load	94.1 per cent.
Three-quarters load	93 "
One half load	91.4 "

The generators were tested under full load for ten hours, and the rise in temperature was calculated from the increase in ohmic resistance and direct from thermometer readings. The insulation was measured by the volt meter method and by applying a potential of 3000 volts to the fields and 5000 volts to the armature. The apparent anomaly in the field temperature as determined by the resistance method (15 deg.), and by the thermometer reading (24 deg.), is probably due to the thermometer being affected by the heat of the armature. The fields run very cool.

The report shows the heating of the armature to be 47 deg. Centigrade and of the fields 15 deg. C., as calculated by the increase of resistance method, while the following readings show the rise in temperature above that of the air as recorded by the thermometer direct.

Bearing	17 deg. C.
Collector ring	30 deg. C.
Field coil	24 deg. C.
Leading pole tip	21 deg. C.
Trailing pole tip	23 deg. C.
Binding wires	51 deg. C.
Armature surface	43 deg. C.
Top of iron frame	10 deg. C.
Armature spider	32 deg. C.

The step-up transformer equipment consists of two sets of the General Electric type of air blast transformers, there being in each set three 160 kilowatt transformers taking the generator sixty cycle three-phase current at a potential of 500 volts, and delivering to line a potential of 11,500 volts. The primary and secondary windings of both of these transformers are in delta, and a seventh transformer is at hand to use in emergency.

The transformers were submitted to a like exhaustive test which lasted under load for 4½ hours, the temperature being measured by the increase of resistance method.

	160 KW.	75 KW.
Primary	33 deg. C. av.	35 deg. C. av.
Secondary	32 deg. C. av.	32 deg. C. av.
Iron	22 deg. C. th.	21 deg. C. th.
Efficiency, full load	97.4 per ct.	96.7 per ct.
" ¾ load	97.1 per ct.	96.1 per ct.
" ½ load	96.05 per ct.	94.8 per ct.
" ¼ load	92.7 per ct.	93.2 per ct.
" 1 1-10 load	84 0 per ct.	83.0 per ct.
Core loss, full volts	3200 watts av.	2050 watts av.
Magnetizing current,	.52 amperes.	.375 amperes.
Power factor no load,	.53	.54
Insulation test	20,000 volts.	20,000 volts.

TO-DAY electric heating, using that term in its generic sense to cover a variety of uses and purposes, stands just where electric power did ten years ago.

THE next meeting of the Pacific Coast Electrical Transmission Association will be held in Sacramento, Cal., on October 20, '97.

WANTED. — A Second-Hand 5 OR 10 STAMP MILL.
Address, stating particulars, price, etc., A. B. this office.

WANTED.
Position as Chemist in Cyanide Mill
By competent Chemist and Assayer, thoroughly understanding process, and with practical experience in mine and mill work. Best of references. Address WM. C. ALLEN, Mountain View, Cal.

WANTED TO LEASE
Tailing Dumps at Mill, with Steam or Water Power.
STATE FULLY PARTICULARS.
"Tailings," care of Mining and Scientific Press.

TO LET.
Machine Shop or Factory.
30x60 GROUND FLOOR.
Newly Fixed Up. (With or Without Power.)
RENT REDUCED.
109 & 111 MISSION ST., SAN FRANCISCO

FOR SALE CHEAP.
Gold Wet Washing Machine,
MAIT'S MAKE.
Capacity, 8 Tons Per Day.
Good order. Can be carried anywhere by prospector.
Address T. L., this office.

FOR SALE CHEAP.
First-Class Air Compressor (Steam driven) and Drill, New.
Also, 3-Ton Capacity Pulverizer.
A. L. FISH, 59-61 FIRST ST., San Francisco.

FOR SALE.
PROMISING QUARTZ MINE
In Sierra County, California,
With 10-Stamp Mill, run by Steam or Water Power. Fully equipped with all necessary tools. Free water. A little more development will make the mine a first-class proposition. Address "E," P. O. Box 2504, San Francisco, Cal.

FOR SALE CHEAP.
60-STAMP MILL.
Good as New.
Erected by Risdon Iron Works in Madera county, about twenty-five miles from Raymond station. Also large Engine and Steel Boiler, two small Engines and Boilers, Pelton Water Wheel, two Frue Concentrators, quantity Pipes, Air Compressor, Hoisting Plant, Miner's Tools, etc. PRICE $12,250, NET CASH.
P. L. DUNN, 803 Battery St., S. F.

Pacific Refining & Roofing Co,
113 NEW MONTGOMERY ST., S. F.
Works, Potrero.

W. & P. ONE-PLY ROOFING.
For temporary use. Good for 2 or 3 years. Felt, Coating, Tin Caps, Nails—complete.
Per Square of 100 Feet, $1.50.

W. &. P. THREE-PLY READY ROOFING.
A permanent roof. Easily applied. With Coating, Tin Caps, Nails—complete.
Per Square of 100 Feet, $3.00.

W. & P. PARAGON ROOF COATING.
A good and cheap roof paint for wood or metal. Also for water-proofing walls, submerged or buried woodwork.
Barrels, 30c; Five-Gallon Cans, 35c.

W. & P. BLACK DIAMOND PAINT.
Unequaled for boiler fronts, stacks, pipe coating, or wherever a first-rate black paint is wanted.
Barrels, 40c; Five-Gallon Cans, 45c.
Specify W. & P. Can be Ordered of Dealers.

"The Mining Laws of the State of California."
By FREDERIC HALL, Author of Hall's Mexican Law.
With opinions of the Attorney-General and J. F. Cowdrey, Esq., on the New State Location Law, and Court Decisions on important points.
Price, 30 cents, by Mail, Postal or Express Order.

Mining Summary.

CALIFORNIA.

Amador.

The Monte Cristo mill is not running steadily. Work continues on the upraise.

The Iron Mass force has stopped sinking and will drift at a depth of 300 feet.

The Madrone people are sinking a winze on a 2-foot vein of decomposed quartz and ochre that prospects high.

The *Dispatch* reports W. J. McGee in San Francisco last week to place the Bay State mine so that creditors could realize on their claims. It says the Bay State Company is insolvent and owes about $20,000. Mr. McGee says the people of Plymouth, who have carried the mine for several years, cannot afford to lose this much money. It is said that the creditors will bond the mine for the amount of their claims if the promoter will agree to operate the property and pay for what he does. The mine embraces eighty acres of patented ground, and has a 10-stamp mill in good order, hoist, pipe line, etc. The shaft is down 750 feet on a ledge of $4 ore, which, it is claimed, will pay expenses if worked economically.

At the Potazuba mine, Sutter creek, the shaft is down 475 feet, and at a depth of 550 feet drifts will be run north and south.

Butte.

The superintendent of the Spring Valley mine at Cherokee is having one of the old tunnels reopened and retimbered that drifting may be carried on.

The *Mercury* chronicles the sale of the American gravel mine, at Magalia, to A. W. Morganstein of San Francisco for $6,000.

The Nimshew Gold Mining and Power Company of Chicago, Ill., A. F. Jones general manager, have purchased the Carter quartz mine and will also work one mile of the bed of Butte creek. The company have purchased the Moss ditch and will repair it and put it in shape for use. There are twenty-one men employed. T. O. Carter is superintendent and the company have a big plan which he is carrying out. This is to generate the equivalent of 3000-horse power in electricity for use in the mill and mine. The intention of the company is to extend the line of wires from the mine direct over the hills to Chico, so as to supply both light and power in that city. The distance in a straight line is only twelve miles, while it is something over twenty by the traveled road.

Meline Bros., owners of the Golden Nugget mine on Philbrook creek, have eight men at work on a channel that yields pay dirt.

At the Ethyl mine, formerly known as the Wylie mine, eleven men are under the supervision of W. D. Edwards.

In the Emma mine, owned by the Nimshew G. M. Co. of San Francisco, the tunnel has reached a depth of 1700 feet and a rich channel has been struck. G. C. Higgins is superintendent. An air shaft 315 feet deep is being sunk to strike the face of the tunnel. They are down 91 feet through solid lava with their shaft.

Register: On the west branch of Butte creek the John Dix mine is giving employment to thirty men working gravel. The Peter Woods mine, under the supervision of A. J. Walsh, is employing nine men. Work on the Bader mine near Magalia is steadily being pushed ahead.

Calaveras.

The Drake and Tryon mine group near Angels is being developed. At the Tryon, the shaft has reached a depth of over 300 feet. The shaft on the Ghost is about 400 feet deep. Heavy machinery will soon be put in place and work resumed.

The Drake and Tryon mine three compartment shaft has reached a depth of 50 feet. Preparations are making to build hoisting works.

The mill on the Union gold mine near San Andreas is being moved to the Great Western, near Angels. Crushing of ore from that mine will ensue.

A change in the management of the Thorpe mine has taken place, L. Allgewahr, the superintendent, tendering his resignation. Jas. Cullen is acting as temporary superintendent.

Prospect: F. Brunner, owner of the Bald Hill mine, two miles from Angels, has two wagons engaged in hauling ore from his mine to the new Tulloch mill for crushing. There is an 8-foot ledge in the mine and the rock will assay from $6 to $179 to the ton.

The South Paloma mine is down over 700 feet and has encountered a second stringer of quartz double the width of the first one, found six or eight weeks ago, and rich in sulphurets. These stringers are between the hanging and foot walls with heavy gouge and native gold, both in float quartz. The company proposes to sink 1000 feet before making any preparations for building the 40-stamp mill now in contemplation.

El Dorado.

In the McDonald mine, at Grizzly Flat, the gravel goes as high as $30 to the pan.

Nugget: J. J. Gearhart is putting up a new 10-stamp mill on his mine in Mud Springs township, two miles below the Church mine. They have been running a tunnel and are in over 400 feet where they struck the ledge, which justified the erection of the mill.

Grading is being done to the millsite at the Pocahontas mine, and it is understood that a 10-stamp mill will be erected at once. The mill is eventually to be of twenty stamps, although the ten will be put in position this fall.

Humboldt.

Arcata *Union*: The gold beach mining now being carried on about one mile below the mouth of Little river is proving a successful operation.

Kern.

The Rand mining district announces progress, outside capital coming in looking for investment, mining properties changing hands, claims being developed, etc. M. R. Richie, Los Angeles, expects to begin the erection of a mill next month. A pocket is reported struck in the King Solomon mine, the ore running from $1200 to $2000 per ton. A cyanide plant is to be erected upon the mine owned by the Gold Bug M. Co. The Val Verde has 200 tons of ore on the dump awaiting milling. The mill at Cuddyback is kept busy with custom work. The G. B. mine of Randsburg has been bonded to F. Cole, who has begun work.

Randsburg *Miner*: A run of seventy tons of Wedge ore has just been finished at the mill at Cuddeback lake. The ore ran $150 per ton.

The Mojave Gold Mining and Milling Company is operating the Wonder, Wedge and Grachyte claims, on the southeast slope of Soledad mountain.

The White Peak Group Mining Company owns 260 acres of mining locations on the south and west slopes of Soledad peak, six miles from Mojave. It embraces fourteen claims.

Mariposa.

Gazette: At the Sellick mine near Hayward, a new mill has been completed; twenty-seven men are employed. The main shaft in the mine is down 170 feet, and will be sunk another 100 feet.

A Modesto company has been formed to operate the Woodside mine.

On the Merced river, at Brown's Flat, Olsen Bros. are down 70 feet and have a vein which carries free gold and sulphurets.

Mono.

Supt. J. J. Kermeen of the Dunderberg mine is urging his principals to attack the mine from the Green creek side, where a tunnel about 3300 feet long would strike under the present workings more than 1000 feet, and run along the course of the vein all the way, thus developing as well as draining the ground.

Nevada.

The La Suerte Gold Mining Company has levied an assessment of 5 cents per share, delinquent September 28th.

The Last Chance mining property is bonded to Rodehaver, Porterfield and Barnes. C. W. Porterfield is superintendent. The company will build a new 20-stamp mill.

The Phœnix M. Co. (formerly the Sneath & Clay) of Nevada City will build 480 feet of flume to bring to the hoisting works the water of Hitchcock ravine.

The *Transcript* says ore from the Rocky Bar and Massachusetts Hill mine, near Boston Ravine, is being hauled to the North Star mill. In appearance the ore resembles that taken from the mine by the Watt brothers many years ago when 7000 tons averaged $80.

(Special Correspondence).—A transaction of much significance to our mining district was completed last week. The property owned by C. D. West and S. Fowler, comprising seven claims, was transferred to Rhodehaver, Porterfield and Barnes. There is a 5-stamp mill on the property, the capacity of which will at once be increased. The ledge averages 4 feet and the ore value is from $10 upward. Now that this property will be extensively operated, and the permanent opening of the ledge at the Gaston Ridge mine, as also the prospective work and mill on the seven claims owned by Geo. Mainhart, the Washington district will attract merited attention from mining capitalists.

Work is progressing steadily at the Ormonde with satisfactory results. The tunnel on the McCarthy ledge—a large ore body that runs from $4 to $9—is being continued with success. J. F. L.

Washington, Sept. 6th.

(Special Correspondence).—The Stanford mine, formerly known as the Oro Fino (the bonding of which by Judge Caldwell to Messrs. Neff & Coleman some weeks ago was chronicled at the time in the MINING AND SCIENTIFIC PRESS), is the scene of considerable activity. The water will be pumped and the shaft driven 200 feet deeper and several drifts will be run. The property will be thoroughly prospected.

Parties are negotiating with Frank Cook of Sierra City for his properties at Meadow Lake in this county.

It is authentically reported that Salt Lake people have acquired new holdings in the Meadow Lake district and that work is to be resumed on properties that had been operated on, but abandoned later on.

Mr. Schockley of Cincinnati has begun active work at the Old Sneath & Clay, adjoining town. The property is now known as the Phœnix. The new company is composed of Ohio people and Dr. Tickell of this city.

At the old Howe Diggings near town, two young men—Fiske & Hall—made a good strike last week in washing gravel. Current rumor places their amount at $4000.

Prospecting at La Suerte mine progresses favorably.

Work on the Searls continues with good results.

Nevada county, though it has a number of dividend-paying mines, has a vast amount of territory awaiting the prospector and capitalist, though local capital is by no means idle in opening new prospects. In this respect Nevada county is as active as probably any other mining county in the State.

Nevada City, Sept. 6th.

Placer.

The Gold Run gravel mine was recently sold to London men. The bottom strata has been opened by a tunnel. At the mouth there is a 10-stamp mill crushing. A hydraulic tunnel runs in under the channel from Canyon creek. The debris will be stored in Canyon creek canyon, 500 feet wide, available for storage purposes 1⅓ miles. The company has a half-million feet of lumber and forty men are repairing the flumes, canals, etc. J. E. Doolittle is general manager.

The Marguerite Gold Mining and Milling Company has elected W. Schmitz, president; G. Gall, 1st vice-president; F. M. Freund, 2nd vice-president; H. Guembel, treasurer; F. Mettman, secretary; Chas. Peach, superintendent.

Chubb, Knox and Bell have a chimney on the Remington Bell place, from which they are taking out gold in decomposed granite, the pans averaging $10.

The Eclipse clean-up last week gave as result 155 ounces of gold valued at $13.60 per ounce, after a run of twenty-two days with ten stamps. B. Hawkins is superintendent.

The Curtin Mine and Milling Company has incorporated at Newcastle: J. Curtin, E. H. Baxter, A. McDonald, M. Murphy, G. W. Fletcher.

At the Mayflower gravel mine, 1⅓ miles north of Forest Hill, at an elevation of 2700 feet, Wm. Rule superintendent, a 20-stamp water-power mill capable of crushing nearly 200 tons of rock daily, is running. Seventy men are at present employed, and eighty cars of a ton each are crushed per day. They are breasting in the tunnel 8000 feet in. Four rubbers, one in front of each table, carry the gold to the undercurrent. The tailings are dumped into the company's canyon. Six hundred feet of flume convey the water.

The Breece and Wheeler or Paragon mine at Bath has been leased by Grenell & Akers. Thirty men are employed breasting an old channel about one-half mile in. A 10-stamp steam-power mill is kept busy twelve hours a day; the amount crushed per day is about forty tons.

The gravel mine at Red Point, a mile and a half from Damascus, owned by the River Mining Company of Paris, France, is superintended by J. A. Ferguson. Sixty-five men are employed in the Red Point Channel tunnel, 2⅔ miles long. The channel averages 150 feet in width. About 3000 cars, of a ton's capacity each are taken out per month. The cars are run by horses, three for each shift.

A director of the Pioneer says that the mine is yielding monthly net earnings at the rate of 10% per annum on the par value beside paying all the development and contruction expenses, that the August yield will be at least $14,000, and that the ore is averaging $20 a ton.

Plumas.

At Granite Basin the Morning Star mine, which gives employment to twenty men, is to have a new hoist engine, drills, air compressor, etc., and a few weeks will see it running again.

R. Hodge took out a $1000 pocket last week at the Shaw mine.

The Starlight mine is reported to have realized $40,000 in August from the ore that was shipped to San Francisco. The mill employs twenty-seven men under the superintendency of Mr. Blanc. H. L. Robinson is credited with intention to start a new shaft on the Greenstone mine, near here.

The Thistle Shaft is closed. The pumps have been taken out. A long tunnel through rock a mile and a half could be run or work could begin 40 feet up in the shaft and run a tunnel until the top of the present work on the channel is reached, which is 40 feet above the bottom of the shaft. In sinking the shaft the contractors, after going down several hundred feet, struck a bed of quicksand and pumped out thousands of tons. Finding they were making no headway, they gave up the contract. Some local miners declared they could sink it and were placed in charge. They built a thick, heavy wooden bottom to the shaft with a small trap opening upward. This bottom was laid upon quicksand and just enough sand was permitted to come up through the opening so that the bottom would sink down about 8 inches. Then a set of timbers were framed and placed in position. Then the trap door was opened and the sand slowly forced its way up through the opening until the bottom sank the required depth, when the trap was closed, the sand lifted from the shaft and another set of timbers placed in position. This was continued until the bed of quicksand, 50 feet in depth, was passed.

San Diego.

The defendant in the case of the Free Gold Mining Company vs. James Spiers et al. has appealed to the Supreme Court from the order appointing C. N. Pauly receiver of the Golden Cross mines at Hedges.

A tunnel is being run on the Seventy-Six mine to tap the vein at a depth of 400 feet. A number of stringers have already been cut. Forty feet more and the main ledge will be encountered.

The Poor Man's Mining Company is being incorporated, based upon the purchase and development of the Mountain View and Poorman mining claims, two free milling properties between the Stonewall and Ranchita mines, near Banner. It provides for 1000 shares $10 each, payable in monthly installments.

A New York house has ordered from the Laguna Mining Company of this city, a sample car load of antimonial ore from their Laguna Mountain property for shipment to England, with a view to developing an extensive business. A 6-foot vein of antimonial ore has been found in the Alpine mine in the Laguna mountains while assessment work was being prosecuted in Mesquite district. A great many claims have been recently located—about ten miles square is taken up. Placers have been worked for years. As in the case of most desert districts, there is a lack of water for the working of ore. Water for camp purposes is hauled from the railroad station at Galmis, six miles away. The water problem will probably be solved by piping it from the Colorado river, twenty miles away.

Three thousand dollars per month is being taken from the Ranchita mine in the Julian district. The 5-stamp mill is kept busy on $30 ore from development work only.

Shasta.

Free Press: The Hidden Treasure mine was shut down last Saturday night and over thirty men laid off. This property belongs to the Montain Copper Company and has been worked for flux ore. The cost of getting out ore was about $2.25 a ton, and the company can buy ore for fluxing for about $2 a ton on contracts. After the lay-off six miners, among them Wm. Gilbert and a man named Williams, entered into a contract to take out the ore for the company for about 50 cents a ton less than they had been paying. The discharged men will probably go to work for the company on other mining property.

Sierra.

The Gold Valley mine resumed work about three weeks ago. The company is employing about twenty men at the mine and in the mill. The mill and all other machinery is run by electricity.

The Willoughby mine will soon be started up under the management of Mr. Woodworth.

Messenger: The workmen who were employed at the Garnett mines near Hepsidam have put an attachment on the property to secure unpaid labor, amounting to about $5000.

Siskiyou.

A strike is reported in the Schroeder mine seven miles from Yreka, on the 1200-foot level, the vein is 4 feet in width, averaging $130 to the ton. Since the 10-stamp mill and five concentrators were destroyed by fire two years ago the owner, J. H. C. Schroeder, has been running tunnels, endeavoring to strike the vein which faulted on the 1000-foot level.

The Distelhorst-Barton Klamath river dredger has resumed operations near Oak Bar.

Yreka *Journal*: The Klamath river dredger on the Klamath river produces good pay gravel. A few places on the river were very light, but other places paid so well that that made up for the poor gravel beds. The big scoops handle about a ton of gravel each time. If each scoop would pay 25 cents the owner would make plenty of money.

Mining around Oro Fino is quiet. The hydraulic mines in Oro Fino are rich, but can be operated only a few months in the year, by reason of a shortage of water.

The Katie May mine on Greenhorn, near Yreka, will be worked this fall and winter, and the owners expect to take out a large quantity of quartz.

The big mines down the Klamath are waiting for the commencement of the fall rains before they will be enabled to resume operations. Several of the properties were doing so well when they had to close down, that the owners are very anxious to get to work again. The streams in every part of the county have not been so low for years, as they are at present. The wheels on the Klamath have to be set as low as possible in order to keep them in motion.

The old Steamboat mine on McAdams' creek, owned by A. C. Brokaw and W. Bennett, was sold a few days ago to a company of Chinamen, who will try their luck at working it. The Steamboat is one of the oldest mines in that section, being situated on McAdams' creek, four miles northeast of Fort Jones, embracing several old claims, in all about 2½ miles along the course of the creek. The top ground was thoroughly worked in early days, but bedrock has never been reached on account of the great difficulty in handling the large amount of water encountered. Brokaw and Bennett, who have just sold the mine, have been working on a shaft 100 feet deep of 6x14, with three compartments. They equipped the mine with a double drum hoist and three Dow pumps, which were operated by a seventy-five horse power engine. They had planned a drain tunnel 1⅓ miles along the creek, where it was expected to reach bedrock. Thousands of dollars have been spent in this mine and there is little doubt that it would be a paying property if the bedrock could be drained without entailing such a great expense and such a large amount of labor. The Chinamen form a company and work these mines to much better advantage than white men, as they do all of their own work, so it may be that this Chinese company will make a success where white men have not.

The hydraulic mines on the Salmon river have had a prosperous season, but water is short now.

Trinity.

The *Journal* thinks there is undoubted evidence of an ancient river channel in the county, which has been one of the main sources of gold in the leads diverging from it. Years ago, during the glacial period, California was covered with immense glaciers and ice-capped. During the subsequent change of temperature these immense ice fields melted and the glaciers receded northward. Consequent to the melting ice immense rivers were formed, ran their course, deposited an immense amount of gravel, and in the course of time became dry, leaving only geological traces of their pre-historic formation. All northern California shows traces of these prehistoric rivers.

In Trinity the course of one of these ancient river channels is clearly marked. It is shown most plainly in Trinity Center. At the Bloss & McClary mines and the old Coyle claim the deposit is plainly discernible. It is the only place in the county where the evidence is so plainly seen. There the channel is not exceedingly deep and is about 500 feet in width, lying between the rim rock which rises high on each side. The trend of the channel is southwest, and it shows plain indications in a southwesterly direction to Minersville. At the above-named places it is worked by the hydraulic process and yields large returns. The channel is crosscut with numerous streams and runs under the mountain dividing Swift creek from the East Fork of Stuart's Fork. All that country is filled with a volcanic mud flow. The channel shows plainly at the old Kapusta mine at Minersville.

The ancient river apparently ran down the Coffee creek country from the Siskiyou mountain, through Trinity Center and Miners-

ville, continuing on through Weaverville, passing through the Oregon Gulch mountain and breaking up in the Junction City basin. From Five-cent gulch in Weaverville basin, past the hill on which the electric plant is located to the La Grange ditch, is a large deposit of the volcanic mud flow. The well-known Hupp & McMurry placer is a lead from this channel; the La Grange mine is an integral part of the same. Competent authorities assert that beneath the false bedrock of Weaverville basin will be found this ancient gravel deposit, which can be worked to advantage by deep drift diggings. Along the ridge of Buckeye mountain near Minersville evidences of this ancient channel are plainly discernible.

This old channel offers a favorable field for enterprise. Wherever struck it has yielded large returns. Along its course it offers splendid inducements for capital. In the lower counties deep drift diggings are worked successfully, and there is no reason why they should not be here.

During the upheavals of ancient times, the grinding of the ice cap upon the auriferous soil and the consequent disintegration filled the turbulent river with an immense amount of gold-bearing gravel. The ancient channels comprise a large amount of auriferous gravel. Where crosscut by more modern streams leads have been formed of excessive richness. However, a large part of the old channel still remains and only requires capital and intelligent effort to yield large returns.

Tuolumne.

The Rawhide Mining Company is installing an electric plant, 1,000 H. P., on the north fork of the Tuolumne river. The water is diverted by canal and flumes three miles long giving a fall to the pipe line of 500 feet. The transmission line will be 12½ miles from generator to distributing point at the mine. The power will be used for general mining purposes, lighting, etc. The system is duplicated throughout to guard against accidents.

The Hibbing mine is being operated by Osborne & Sell of San Francisco, W. D. Hibbing superintendent. A shaft has been driven down 165 feet, at which point a station was cut out and drifting commenced. The ledge showed 18 inches of good rock that would mill $22 per ton; recently the *Democrat* reports better ore estimated to be worth from $50 to $100 per ton.

A. C. Maier is operating the Felix gravel mine on the main Tuolumne, near the Buchanan with 10 feet of pay gravel.

The *Banner* reports that it is proposed to sink 1200 feet at the Dutch. An 18-foot vein has been uncovered at the Junction. The stamps at the Arbona mill at Tuttletown are falling upon rich ore. There is plenty of rock of the best grade. Drifting and crosscutting is going on at the 600-foot level of the Rappahannock. Sinking will proceed to the depth of 1000 feet.

From Stent is reported a strike in the Mascot mine, the property of the Santa Ysabel M. Co. It is thought that the pocket will yield about $50,000.

A strike was also made recently at the Green mine, situated on the east belt, on the 300 level.

Colby & Beckwith, who recently struck a pocket in the Tansy quartz claim near Sonora which produced $40,000, came to San Francisco this week and report that there are no Tuolumne miners who have the Klondike fever. Land adjoining that from which this big pocket was taken out has been leased and will be thoroughly prospected. The Tansy claim is on the eastern slope and is a spur of the Bald Mountain.

NEVADA.

J. W. Brim of Williams, Cal., bought from Denio, Deegan & Cowden of Winnemucca, their gold mine in the northern part of Humboldt county for $16,000.

At the Buckeye placer claims, thirty-five miles from Carson, the Raycraft brothers, owners, worked nine weeks washing out nearly $4000, which brought at the Carson Mint $19 per ounce. C. D. Lane recently bonded the Buckeye mine for $250,000, after expending over $20,000 in exploration and surveying, he decided the cost of procuring and bringing in the requisite supply of water for sluice and hydraulic purposes would be $1,000,000 and gave up the bond. Herman Zadig and other San Franciscans have still more recently bonded the same property for $300,000.

The Gold Creek *News* reports a strike in the mine owned by the Walker Bros. at Mountain City, Elko county. This property was worked years ago and produced ore that was worth $4 a pound. At a depth of 40 feet the vein was lost, and it was thought the vein did not go down. After some prospecting it was discovered that the mountain had faulted 200 feet and the ledge was again found in place, 8 feet wide, going down between granite walls; 35 feet in from the 125-foot level the ore chute was again encountered. From 10 to 22 per cent of the values of the mine have been gold, and gold shows all through the ledge matter in the present strike of 8 feet.

The beneficial working of the new mining law is seen in the development of Island mountain. It is now covered with 10-foot holes dug this summer showing up good ore, while older sections have been held for years without a stroke of work.

OREGON.

Jacksonville *Times*: A. B. Hopkins has sold the DeLamatter mine in Kerbyville district to Portland parties for $4000.

The Oak Flat Placer Mining Co. of Josephine county is constructing a ditch three miles long from Soldier creek to their mines, which will carry 4000 miners' inches of water. They sent to the Willamette valley for laborers last week, as they could not be obtained here for the wages offered, $1 a day and board.

Baker City *Democrat*: The California mine, Cable Cove district, recently purchased by W. J. Connors of Butte, Montana, will employ forty men. The machinery for a 5-stamp mill is on the ground.

At Granite the Ross gulch claims are being worked by Clark Bros., who have built a mile of ditch, put in 2000 feet of 20-inch pipe and syphoned the water across the gulch.

The Don Juan mine, recently sold for $30,000, has put in a sawmill and is getting out lumber for a 10-stamp mill. The Pyx mine, owned by one of the Geisers, who sold the Bonanza property, and the Phœnix, owned by Shultz & Berry, have both put in new machinery. All work had been suspended on the Phœnix property for two years until this summer. At the Red Boy and Clear Creek mines, owned by Godfrey & Tabor, a sawmill has been put in and lumber is now being sawed for a 10-stamp mill. The Quebec ledge is bonded for $25,000. The La Bellevue, recently purchased by Keith & Bamberger of Salt Lake, is now being operated, and great things are expected of this property, which has over 8000 feet of development on it.

WASHINGTON.

The Mashel Copper Mining & Developing Company, $1,500,000, has four claims thirty-four miles southeast of Tacoma, the vein averaging 2¼ per cent copper. The company claims it can be mined and reduced for 75 cents per ton.

E. B. Burdick, superintendent and manager of the Acme mine at Marcus, shipped his first car of ore last week. Indications are that the mine will continue shipping all winter. B. Setzer is superintendent of the Sunday Morning mine.

BRITISH COLUMBIA.

The Rossland *Miner* is authorized to announce the sale of the Velvet mineral claim, Sophie mountain, to the New Gold Fields of British Columbia for $62,500; $12,500 cash.

The management of the Noble Five mine submitted a proposition to their men to pay $2.50 and $3 per day. The reduction was not accepted and the miners are at work at the old scale pending the decision of the managers in the matter.

The mines above the head of Kootenay lake are still clamoring for the completion of the government trail from Cody creek connecting via Hamill creek with Argenta, says the Kaslo *News*. Rich ore awaits shipment, but the government is lamentably slow.

At the Trail smelter there are now $300,000 worth of ore in the roast heaps. The roasting takes out the sulphur and arsenic, the loss in weight and bulk is from 15 to 25 per cent. The roasting ore is laid in heaps 50 feet long, 20 feet wide, 10 feet high, in the form of an oblong pyramid. The base is made by dry wood; when fired the lower part of the heap becomes a red hot mass with vent holes in the outer shell through which escapes a stifling smoke. The wood simply starts the fire, the ore supplying its own fuel. It requires about six weeks to burn out the entire mass. About 225 tons of ore a day are now being smelted, which if it averages $30 per ton, would yield $6,750.

The Cariboo Hydraulic Mining Company, operating in Cariboo, reports that the result of the cleanup completed on August 16 amounts to 5,685 ounces of amalgam of the estimate value of $60,000, the proceeds of forty-seven days' washing with two giants. The dryness of the season has considerably lessened the supply of water, and the cleanup was not as big as expected. Next season the company will have completed works which are expected to add greatly to the output.

At Grand Forks, W. C. McDougall has sold his gold-saving plant in operation on the Eighteen Karat group. A ditch 800 feet long and 6 feet wide carries the water from a wing dam across the river. The machine that is to do the fine work with the gravel after it has gone through the grizzlies is a light-built apparatus, resembling in appearance a banker's high desk. It contains a cylinder 18 inches in diameter, covered with copper plates, which revolves in a trough, in which is a supply of quicksilver. The revolutions of the cylinder carry the pay dirt through the quicksilver, which catches the gold. Mr. McDougall expects the ground to yield $1.25 per cublic yard.

Manager E. J. Field of the Wonderful mine at Slocan figures a profit though silver goes lower and with the lead tariff 100 per cent greater than last year. He takes the average value of a ton of Slocan ore and says:

100 ozs. silver at 50c.	$50.00
60 per cent lead—1200 lbs at $2.10	25.20
Total	$75.20
Freight and treatment	20.00
Net for mining and putting on cars	$55.20

This is estimated at a lower price than the present quotation for silver; lead is figured less the $1.50 duty.

ALASKA AND N. W. T.

Healey Dall, paleontologist to the U. S. Geological Survey, says:

"One serious danger menaces the large population now pouring into the district. The upper Yukon is a country where subsistence has always been difficult. The first party which ever reached it, that under Robt. Campbell of the Hudson Bay Company, who named the Pelly river, though composed of seasoned voyageurs, was, if tradition was reliable, forced to support life by cannibalism before it could reach help. In 1866, not more than three hundred Indians were able to find subsistence between Fort Yukon and Fort Selkirk. The abundant fish and game of the lower Yukon are absent. The river steamers available for transportation cannot, during the remainder of the present season, carry up to Dawson City much more food than will supply its present population. It seems improbable that any large proportion of the people now hurrying over the Chilkoot portage can transport—if indeed they possess—food enough to carry them over the winter and up to the arrival of summer supplies from the lower Yukon. Very serious hardships, and even possible starvation, therefore, confront the rash and foolhardy, who push forward without proper supplies into a region whose limitations they do not realize. Fortunately, it is likely that many of those least prepared for the undertaking will not get over the divide, and will be obliged to remain in southeastern Alaska, where the rush to Klondike will have left open many opportunities for employment. Were it otherwise, the coming winter and spring would probably furnish material for tragedy. Even as it is, the circumstances offer ground for very grave apprehensions."

The Juneau *Miner* says work will proceed at once on the Alaska G. M. Co.'s properties. Work will be continued on the present shaft and a tram a mile long installed without delay. The present mill of ten stamps will have auxillary steam power, so that there need be no stoppage should the water run short.

A letter from Supt. Trowbridge of the Bald Eagle M. Co., Sumdum, says that the tunnel is in good ore, and that samples sent up here assay $48 and $53 per ton respectively. The mill is running full time.

S. P. Earle & Co. are erecting a five-stamp mill on their property seven miles from Berners bay, near Yankee basin.

The War Horse group of mines at Funter bay is sold to Schaney & Engleman for $20,000. The group consists of seven claims each 1500 by 300 feet.

UTAH.

Last week at Coalville all the property of the Crescent Mining Company was sold to McMillan & McLaughlin for $75,000.

The Bingham *Bulletin* says there are many old mines in that locality formerly noted as large producers and comparatively or wholly idle to-day, which no doubt could be made to repeat or exceed their former records. Some have been gutted of everything in sight and will require a considerable outlay for development work, but improving market conditions are so encouraging no doubt some of the old properties are shortly to resume active operations.

Arrangements are being made for a convention of those interested in silver production all over the State, including mine owners and miners, smelter and railway men, to devise some plan to continue the operation of the mines. It is claimed that, if concessions are made on all sides, the cost of producing silver can be kept within the present low price, and the large number of men employed can continue to find work at at least living wages for the coming winter. The mine owners complain that the railroads and smelters are exacting exhorbitant charges for handling ores, and concessions will be asked. Reasonable concessions will be asked for from the miners themselves in an adjustment of the scale of wages. The mine owners generally seem to want to meet other interests involved half way and make just allowances. It is believed that, if economy is practiced and a scaling down made on all sides, many of the mines that would otherwise have to close can be kept in operation by mining on a small margin.

At Mercur, the millsite for the Golden Gate mill is employing nearly 200 men, and the work is going rapidly forward.

IDAHO.

All the property of the Yellow Jacket Gold Mining Company at Yellow Jacket has been sold to J. S. McChestney of New York for $170,000.

The Lucky Boy Gold Mining Company at Custer have posted notices that wages will be reduced this week, or else work will cease, on account of the low price of silver. The proposed reduction is: Miners, from $3 to $2.75 per day; outside men, from $3 to $2.50, and mechanics, from $3.50 to $3.

At Princeton the Gold Bug has taken a contract to drift on the Early Bird ledge 40 feet. The drift will be on the 100-foot level.

The *Statesman* says the sale of the Black Hornet mine, near Boise, to a Colorado company, is practically closed. A gold nugget worth $69.65 was recently taken from this mine.

Sweetser & Burroughs of Pocatello have a slug thirty-eight ounces worth about $760—the result of three days' run of their gold dredge on the Snake river, near Minadoka. Their boat works the sand from the bottom of the river and handles about 2000 yards of dirt in twenty hours. They say that the sands of the Snake in that vicinity average from 5 to 8 cents per yard.

MONTANA.

The Butte men who bonded the Gold Hill near Gaylord last spring, have relinqished the property after an expenditure of nearly $10,000 in development.

One of the very few silver producing mines now in operation in North Walkerville is the Big Bonanza, owned by King and Wilson. Within the past week ore averaging over 1500 ounces in silver has been mined, and the general average of the 6-inch pay-streak is between 200 and 300 ounces.

Jno. Lee, president Golden Jack Mining Company, says at present the company is working only copper. The tunnel is 180 feet. A St. Louis company will next spring build a mill at the mines.

At Gilt Edge several men are working and the people have greater confidence than ever before in that camp.

Fifteen years ago the Diamond mine near Helena, was listed for sale by a Radersburg mine dealer. Richard Lockey saw the bulletin list, on which the mine was posted, and as a speculation bought it, paying 90 cents. The Diamond was discovered and located thirty years ago by E. Folsom, of White Sulphur Springs. Shortly after locating it Mr. Folsom sold it to a Pittsburg man, who set up a small stamp mill, but did not make a success of it. The capitalists left and the mine was neglected and abandoned, taxes became delinquent, the assessor's valuation on the property was small, and the delinquent tax due was only 90 cents. Mr. Lockey owned the mine for several years, and then sold it. The property has since passed through the hands of several owners, growing in value all the time, until it was sold recently to a Scotch syndicate for $1.300,000. There is now on the property one of the largest and most improved gold mills in Montana.

At Pony, in the Clipper group, Elling & Morris have three miles of tunnels, the lowest cutting the Clipper at a depth of 1400 feet. The ore is a fine-grained, grayish-white quartz, carrying gold free in sulphurets. At the 20-stamp mill the ore is milled wet, the pulp being run over plates, then over vanners and canvas tables; the resulting tailings are then treated by cyanide. The concentrates from the vanners and the slums from the canvass tables are treated at the East Helena smelter. About fifty tons of ore are milled every twenty-four hours, forty men are employed in the mine and mill.

At the Old Joe a homemade concentrating plant is making money for the owners. The material used in the homemade plant was a cracked mortar, five worn out stamps, a wooden water wheel, an old discarded, three-compartment jig and a roughly constructed vanner.

The Bailey mill is now being erected by the Mastodon Gold Company on Monitor hill near the new postoffice of Mammoth. The mill is to be of forty tons capacity. The Bailey process may be called a continuous cyanide process, although it really aims to combine amalgamation with cyaniding and a depostion of the gold from solution by electricity instead of the usual zinc shaving.

At Virginia City C. L. Hathaway has a new mill on the Bertha, which was started up last week. The ore is pulverized in a cylinder, divided horizontally into two sections. Inside the cylinder are five rings, so grooved that they receive one-third the diameter of 15-inch balls, which roll in the grooves by gravity as the cylinder revolves. The pulverizing cylinder is fed by an automatic feeder. The cylinder is driven by a 5-foot cog wheel, driven by a 11½-inch pinion, operated by a pulley 30 inches in diameter with an 8-inch face. The ore is carried into a pulverizing cylinder by a hopper, into which it is delivered by a feeder and a screen conveyor. No screens are used to regulate the size of the product, that being regulated entirely by the rapidity with which the ore and water are fed into the pulverizer, the faster the feed the more rapid the passage and the coarser the product; the slower the process the slower the ore passes through the pulverizer and finer the degree of pulverization. From pulverizer the pulp passes by gravity into the amalgamator, which is a cast cylinder 6 feet in diameter. Inside the hollow cylinder is a solid cylinder 24 inches in diameter and 1 inch shorter than the inside length of the amalgamating cylinder. The space between the ends of the solid cylinder and the inside face of the head of the amalgamating cylinder is filled with rubber packing. After the amalgamating cylinder has been running a few moments from 150 to 250 pounds of quicksilver is introduced behind the solid cylinder or roller. As the pulp comes from the pulverizing cylinder, reduced to a fineness of from 80 to 100 mesh, it is delivered into the amalgamating cylinder, the roller, which by gravity keeps in the bottom of the revolving amalgamating cylinder, passes over it, reduces it to a palpable degree of fineness—probably 150 mesh—the pulp raises up through the quick, which takes up any particles of gold fed in the crushing process. After the pulp leaves the amalgamating cylinder it passes over a "Hathaway gleaner," a contrivance in which amalgamating plates are arranged in a peculiar shape.

Edward W. Parker, who has charge of the United States Geological Survey, has completed that portion relating to Montana. In it he says that the total coal product of the State is 1,543,445 short tons, of a spot value of $2,279,672. The annual coal produce of the State has shown an uninterrupted increase each year since 1877.

WYOMING.

Edward N. Breitung of Marquette, Mich., an extensive mining operator, has bought the Albany placer mines on Douglas creek. The price is understood to be $50,000. The property consists of 1100 acres. The remainder of '97 will be devoted to surveys and exploring preparing for a good year's work in '98.

COLORADO.

The Mecca Mining Company sent down 1,000 pounds of ore from the World's Fair lode, eight miles southwest of Georgetown last week which yielded $160 to the ton, the largest proportion of the values being gold. The company is now driving a tunnel through a phorphyry dyke that traverses the claim to cut the vein lower down. The company has secured two other claims in the vicinity, on one of which a four-foot vein has been opened which runs well in gold. The discovery of gold in Georgetown district has been a revelation to miners of that section and many of them refused to believe that gold has been found until the fact was demonstrated by the mill run.

A Denver dispatch says unless the Colorado Midland and Denver and Rio Grande railroads agree to reduce the freight rates on silver ore from Aspen to that city it is probable that all of the big silver-producing properties of that district will be closed down. The mine owners and operators of that district have made a vigorous protest against the existing rates.

An Idaho Springs letter says: In the letting out of men on the silver working lodes the gold interests have taken another step forward. At one of the mines employment was given to all of the men let out at a silver property. This means an addition in the working of gold-bearing properties. Another mine manager says that he intended increasing his force by forty men, and this will take up some of the surplus. What miners are let

out at the silver producers will be given preference in putting on of men at the gold producers. Perhaps 1,000 of the miners working around Idaho Springs were formerly working in the silver mines. It is a wonderful change and because of its gold advantages Idaho Springs has been made to prosper.

From Alamosa is reported the sale for $18,000 of the old Hamilton mine on the east side of Mount Blanca to Pittsburg men. They claim to have a vein of tellurium and sylvanite worth $200 a ton. The new owners are expected to begin shipping soon. Fort Garland is the nearest railroad point to the south. The mine is under the crest of Sierra Blanca, above timber line, and is reached by eight miles of good wagon road and a seven-mile burro trail from Fort Garland.

Manager Hersey of the El Dorado mine at Kokomo says that that property, which has been employing from twenty-five to thirty men, is closed down pending a settlement of the wage question. Owing to the low price of silver Manager Hersey stated to the men that it would be necessary to cut the wages of the men from $3 to $2.50 per day until silver got to such a price that he could put it back. This idea at first seemed satisfactory, but at a meeting of the Miners' Union there Mr. Hersey states the reduction was objected to, and the men so notified him. It was therefore decided to quit work until the matter can be satisfactorily settled.

A placer mining company near Granite makes a cleanup once a month and sends the gold to Granite, two miles, on horseback. Two men heavily armed started with $5000 worth of gold last week and were held up and robbed of the gold and their guns.

The scheme to consolidate the best mines of Empire into one group, which was examined and reported upon by Haggin and Tevis two years ago, is about to be revived. Since that time the treatment of the low-grade ores near the mines has been very much advanced, and the railroad company has agreed to extend their rails from the junction to the camp proper, a distance of two miles. A new mill with a capacity of 200 tons of ore per day is one of the items in the consolidation. The new mill is to be located on the Pearce placer, near the junction, where plenty of water power is available. The mines which are included in the proposed scheme are the Benton, Crown Prince, Pioneer, Conqueror, Corncracker and the Dumont properties. New York and California are expected to furnish the required capital.

Aspen *Tribune*: The Millinee Mining Company have reduced their force from forty-five to sixteen men. The low price of silver is the prime cause of this move, and it is generally believed that should silver advance to the 60 point, or a $3 freight rate be secured on low-grade ore, the force will be increased probably in excess of the old number.

NEW MEXICO.

The Red River *Mining News* believes that inside of twelve months at least $5,000,000 will be invested in the development of mines and in machinery for the reduction of ores in the Red River district.

From Cochiti is reported a free gold strike in the Puzzle mine 12 inches wide.

Oasis: The mill of the Colorado Mining Co., at Las Planchas, Sonora, has started up after a complete and thorough overhauling. Everything is in first-class condition and working finely. During the suspension of the mill development has been vigorously prosecuted, a great area of virgin ground is opened up and ready for stoping, and there are over a thousand tons of high-grade silver ore on the dump, with many thousands of tons in sight in the mine. A great deal of it will run 150 ounces to the ton, and no less than fifty ounces. Superintendent Allen says the Colorado Co. is utterly indifferent to the price of silver—at twenty cents per ounce they can make money. It is the production of such mines that is bearing down the price of silver.

ARIZONA.

The Prescott *Journal-Miner* says a cyanide plant for the Little Jessie mine has been decided on.

At Congress Junction the Golden Wave Mining Company, J. H. Costello superintendent, reports a strike of good ore.

During the past year the United Verde Copper Company have added eight boilers to their Jerome plant, the capacity of each being 250 H. P. The company is now said to have 800 men on their payroll, and disburses over $75,000 on each monthly pay day.

G. Sutherland at Cook canyon, is superintending work on the Cook group of mines.

The King of Arizona is milling and sacking ore for shipment. All the ordinary rock extracted is run through the company's mill at Mohawk, the richest is shipped to a smelter to insure the extraction of all the gold. Boring for water at the mine goes steadily on. A depth of 150 feet has been attained. It is expected that water will be struck within 400 feet.

The Bisbee *Lyre* reports returns received by the superintendent of the Copper King of Arizona of sixty sacks of ore which assayed 4 per cent in copper, 164 ozs. in silver and 28-100 oz. in gold.

Republican: R. R. Richardson has just leased fifty acres of patented placer ground in the Greaterville mining district to a Chicago company. This company will put in a large new dry-process machine which it is claimed will wash fully 100 tons per day.

MEXICO.

A recent article in *El Mundo*, the Government organ, shows that with the silver dollar at 40 cents of our money, Mexico would probably have to export only about 4,000,000 dollars extra in silver to meet all her foreign obligations, which sum would not even touch her metallic reserves of $43,000,000, on which there is a paper money issue of 75 per cent of that amount.

In the State of Jalisco Pennsylvania men have bought the San Vicente mine, and promise to have ready for operation a stamp mill and smelter by November. Gold in paying quantities is said to have been found near Ameca, some distance west of Guadalajara, for the exploitation of which J. R. Williams is trying to form a company with $100,000 capital.

The French house of Rothschild purchased some time since mining properties in the States of Michoacan and Guerrero, and has sent a corps of engineers over the proposed route of a railroad to bring the new territory into connection with the National railroad at Patzcuaro.

Chihuahua *Enterprise*: The dispatch sent to the City of Mexico last week to the effect that Boss Shepherd had shut down his mines at Batopilas, owing to the fall in price of silver is without any foundation whatever. Advices received from Batopilas state that Governor Shepherd has no intention of shutting down his mines, but on the contrary is making numerous improvements and carrying on work on a larger scale than ever and will continue to operate his mines even if silver should go much lower than any point yet reached.

NEW SOUTH WALES.

The diamond-mining industry is steadily progressing in New South Wales. During the past year prospecting work has been carried out on all the leases on the Bingara diamond field. The Monte Cristo mine, through want of water, only treated twenty tons of wash. The Australian Diamond Mines Proprietary Company kept sixteen men at prospecting work and have sunk 1500 feet, and driven 1200 feet in the aggregate, during the past twelve months. The Eagle Hawk Company treated 500 tons of drift, which returned gold and diamonds to the value of £325. The Murchison Diamond and Gold Mining Syndicate is busily engaged in prospecting and constructing dams to conserve water. It is estimated that the output from the field was 3000 carats, the lowest value obtained being 6s per carat. The Boggy Camp diamond mines, situate about fifteen miles west of Tingha, employ about sixty men. In some of the best mines on the field the wash is found 4 feet thick, yielding about ten carats to the load. The stones are of good quality and pure white.

Commercial Paragraphs.

FORMAL ANNOUNCEMENT is made of the consolidation of the Siemens & Halske Manufacturing Company of Chicago and the Pennsylvania Iron Works of Philadelphia. All but 300 shares of the Chicago corporation have been exchanged for those of the Pennsylvania company. The Pennsylvania's capital will probably be increased to $5,000,000.

THE Vulcan Iron Works have just turned out a 5,000-pound wheel that can be taken apart in pieces which do not weigh over 175 pounds each. They were packed in sections by horses last week from Silverton to the Forty-five mine in Snohomish county, Wash. The wheels are to carry a cable 7,400 feet in length running from the mine. Forty buckets will be transmitted on the cable and the full capacity of the system will be 100 tons a day. There are fifty-six grips on each wheel, so arranged that the heavier the load on the cable the tighter will be the grip.

IN regard to a Milwaukee dispatch concerning purchase by Westinghouse Electric and Baldwin Locomotive Works of the Gibbs Electric Company of Milwaukee, the following is authoritive: "The Baldwin-Westinghouse people engaged Geo. Gibbs of the Gibbs Electric Company as chief engineer, and to avoid complications of patents the Westinghouse has purchased outright the entire stock of the Gibbs Company. This is not of any plan such as suggested in the dispatch of absorbing all independent manufacturers of dynamos and motors."

Recent California Mining Incorporations.

Surprise M. Co., San Francisco; E. L. Geist, J. Band, J. A. Fisher; capital stock, $1,000,000; subscribed $60,000.

Revenue G. M. Co., San Francisco; E. C. Harlow, A. A. Dudley, G. Stone, G. H. Pippy, M. F. Loewenstein; capital stock, $100,000; subscribed $500.

California Reduction Works, San Francisco; F. M. Graham, F. E. Kingsbury, C. E. Hailstone, F. E. Titus, F. S. Oliver; capital stock, $2,000,000; subscribed $1,000,000.

Glenn Con. M. Co., Forest Hill; F. G. Hoffman, G. R. Cowan, D. A. McDonald, J. A. Shields, P. G. Halligan; capital stock, $75,000; subscribed $35.

Recently Declared Mining Dividends.

Le Roi, B. C., $50,000; September 7th.

Calumet and Hecla, Michigan, $10 per share; payable October 1st.

The Dominion Developing and Mining Company, Vancouver, B. C., $1.75 per share; September 1st.

Cariboo Mining, Milling and Smelting Company, B. C.; 2 cents per share, $16,000; September 6—the sixteenth dividend—a total of $173,000.

Coast Industrial Notes.

—The first train over the S. J. & S. F. road reached Visalia, Cal., last Thursday.

—The Southern Pacific announces an increase of 20 per cent in freight rates on wheat, barley and canned goods shipped from California over the lines to New Orleans and New York.

—The shingle output of Washington for '97 will be 15,000 carloads at an average price of $3,000,000. Mills are all busy, and from sixty to seventy-five carloads of shingles are shipped East daily.

—The Yuba Electric Light, Power and Irrigation Company has incorporated in Sacramento, Cal.; capital stock $160,000, all subscribed; J. Markley, Geyserville, W. Longbottom, H. W. Johnson, F. D. Ryan, W. W. Bassett of Sacramento.

—The British steamship Glenlochy is at Portland, Oregon, to load lumber for the Manchurian Railway, Vladivostock, Siberia. She is the largest steamer that ever came to this coast for lumber, having a gross tonnage of 4656 tons and is expected to carry 3,250,000 feet.

—John Martin of the Stanley Electric Company says that work on an electric plant in the foothills twenty miles from Marysville, to supply light and power for Yuba and surrounding counties, would begin immediately, and that the plant would be in operation by April, '98.

—Men are scarce and wages are advancing at Cosmopolis, Wash., says a Tacoma *Ledger* correspondent. Two dollars a day is being paid for swampers. Cedar and spruce logs are strong at $5, with occasional reports of better prices being paid. Fir is still slow at $3.50, and a $4 deal is not looked for for some months yet.

—The controversy for supremacy in San Francisco between the Electric Light & Power Company and the Mutual Electric Company has reached the Supreme Court. The Mutual Company petitioned for a writ of injunction to restrain the Superintendent of Streets from interfering with it in erecting poles on Market street, in this city, and the lower Court denied the petition. The Supreme Court upholds the order of the lower Court, but says: "The contradicted affidavits show plainly that it is a deliberate attempt to drive one corporation out of the field in the interest of another by the oppressive and unlawful use of official power."

—Under separate agreements entered into with the two railway systems of Mexico, the Mexican National Railway Company and the Mexican Central Railway Company, the telegraph lines of these companies have passed under the control of the Postal Telegraph Company. Heretofore telegraphing to the Mexican capital has either been by cable via Galveston and Vera Cruz, or by the American land lines to the Mexican border, and thence by the lines of the railway companies from Laredo or El Paso to the City of Mexico. The contracts now entered into give the Postal Company a continuous system from the United States to all the principal cities in the neighboring republic. To make this possible the Postal Company extended its lines south from Denver through Albuquerque to El Paso, to connect with the Mexican Central system, and it is now building from Little Rock to Laredo to connect with the Mexican National system. This extension will be completed on January 1, 1898.

HO! FOR ALASKA'S GOLD FIELDS!

Greatest gold fields on earth. We have just published a complete guide to Alaska fully describing all her rich gold fields, telling how to get there, cost of trip, routes, etc., also mining laws. Fully illustrated; only reliable book. Facts and views secured by special correspondents right on the ground. Post yourself by securing "inside" information ahead of the crowd. For the present we will send a book free to anyone sending us 25c postage for a 3 month's trial to our big illustrated weekly family paper. Clubs of 5 and 6 books, $1. Agents send 25c for sample. Mention THE PRESS. *Weekly Sentinel*, Denver, Colo.

Personal.

I. B. STORCH, M. E. has removed to 1605 Willow St. Alameda, Cal.,

HERBERT LANG'S present address is Catalina Hotel, Los Angeles, Cal.

O. A. PALMER is examining the Dexter properties at Tuscarora, Nev.

G. E. BAILEY, M. E., has returned from an examination of property in Trinity Co., Cal.

J. R. SHARP has been appointed superintendent of the Diamond Coal Co's. mines, Hahn's Fork, Wyoming.

J. F. MCDONELL has been elected secretary of the Virginia, Nev., Miners' Union at a salary of $4 per day.

PROF. N. S. SHALER, of Harvard University, is in Caribou, N. S., examining the low grade gold ore of that section.

E. F. CASSELL, auditor of the Nowell Gold Mining Company, of Alaska, is in San Francisco on a business trip.

F. S. NICHOLLS has been appointed superintendent of the Hall mines smelter at Nelson, B. C., to succeed Paul Johnson.

JNO. O. NORBOM has removed to Vancouver, B. C., where he will represent the British Columbia Iron Works Co.

FRED W. BRADLEY, general manager Bunker Hill mine, Wardner, Idaho, is in Washington district, Nevada county, Cal.

WILLIAM WRIXON of San Francisco is the new superintendent of the Queen of Sheba mine, near Rawhide, Tuolumne Co., Cal.

W. L. WATTS of the State Mining Bureau is at San Pedro, investigating the oil formation there. Some time ago a well was bored for oil, which is now about 850 feet deep.

BENJ. HALL of Grass Valley, Cal., one of the proprietors of the Pioneer Reduction Works, has received a patent for a reverberatory smelting and refining furnace, of which he is inventor.

M. R. MORRIS of San Francisco has arrived at Sylvanite, Montana, to build the new Gold Flint mill and install the machinery. The Gold Flint will have seventy-five men employed next week.

PROF. J. A. HOLMES, an expert geologist sent out by the United States Geological Survey to investigate the mica deposits of the country, is at Spokane, Wash., and will examine Idaho and Washington mica beds.

F. G. WENTE, an engineer in the service of the Amsterdam firm of Werf, Conrad & Co., is here en route to Holland after two years on the Amoor river, where he has been dredging the Amoor for gold at a salary paid by the Russian Government. He says it is a very rich river. There is no recording of claims there; no individual miner can come and set up his stakes and then begin to dig. If he did he would soon find himself on the convict island of Saghalien. All miners who wash the auriferous gravel are there for the Czar of all the Russias, and what gold they discover goes to his mints to be stamped with his inscription. The mines, no matter if worked by a large company or an individual miner, are all under Government control, and all who have obtained permission to dig—it being necessary to do so before starting—must forward all their findings to the authorities, from whom they receive a percentage. Mr. Wente left Xabaroffsky in June and journeyed to the coast in sleds, wagons, and on snowshoes. He left Vladivostock July 10th for Yokohama.

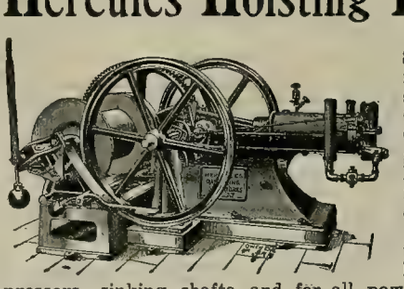
Hercules Hoisting Engines



Solve the difficulty of fuel, and make mining profitable where steam power is too expensive. Over 3000 Hercules Gas and Gasoline Engines are in use giving entire satisfaction. Fully guaranteed. Requires no engineer. No smoke, no dirt. No danger.

We build engines from 2 to 200 h. p. for pumping, hoisting, running air compressors, sinking shafts and for all power purposes. Used in mines throughout the coast.

Send for Catalog to HERCULES GAS ENGINE WORKS, 217 BAY ST. San Francisco, Cal.

MINING MACHINERY, Second-hand.

WILLIS SHAW, Contractors' Machinery, 506 N. Y. Life Bldg., Chicago, Ill.

✦ PRINTED LIST NOW READY. ✦ WRITE FOR A COPY.

NOT SCRAP IRON; But First-Class Machinery

Of standard make and modern design. Have most everything for Hoisting, Excavating, Crushing, Pumping, Quarrying, Etc. All repaired and ready for service. ATTRACTIVE PRICES.

UNION IRON WORKS,

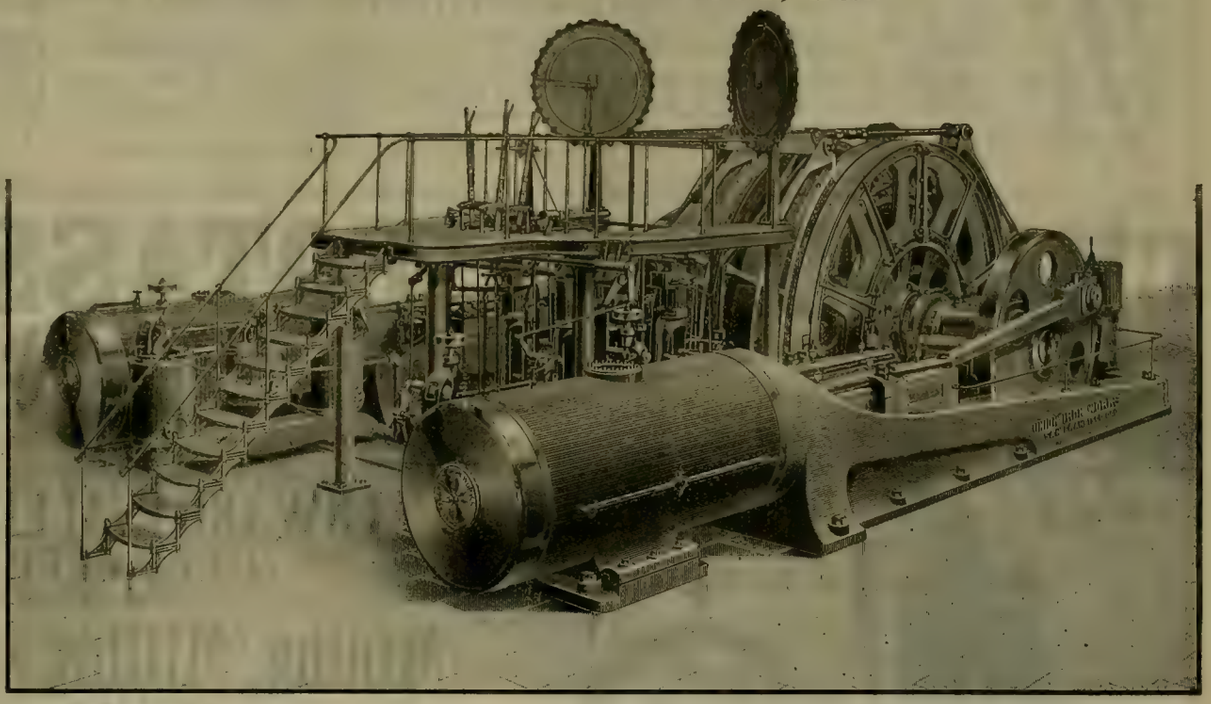
30in. x 72in. Direct Acting Hoisting Engine

BUILT FOR THE

Anaconda Copper Mining Company

OF MONTANA.

Embodying all that experience and practical working have demonstrated as valuable in this class of machinery.



The brakes, clutches and reversing gear are arranged to be operated by compressed air or steam, by means of auxiliary cylinders which are under full control of the engineer, stationed upon the elevated platform shown, insuring the most rapid work with absolute safety. Shaft hollow forged steel of ample strength and stiffness to withstand any strains; reciprocating parts of steel and are as light as consistent with the duty required; cylinders of the "overhung" type, weight being taken by a guide saddle, which admits of free longitudinal movement, due to expansion, causing no strain on bed plate or foundations; cylinders steam-jacketed, fitted with valves provided with Corliss releasing gear and hand cut-off, enabling the engines to be run economically with reference to the work to be performed; bed plates modification of the Porter Allen type, heavy and substantial, with large foundation base and anchor bolts. A duplicate of this engine has also been furnished the Homestake Mining Company of Dakota.

MINERS, ATTENTION!

We beg to call attention to our RISDON HAMMERED PROJECTILE STEEL SHOES AND DIES, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density.

These Shoes will outlast any other make and will not chip or cup.

We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.

Our prices are as low as any, and the article we offer should commend it to all mine owners and mill men.

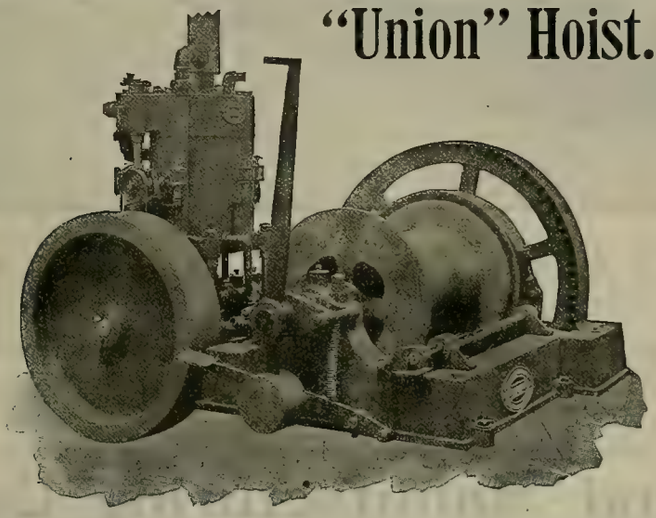
SCHOELLKOPF, HARTFORD & MACLAGAN, Ltd., Sole American Agents.

No. 3 Cedar Street, NEW YORK CITY.

"Union" Hoist.



The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton 125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over 600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

—BUILD THE—

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

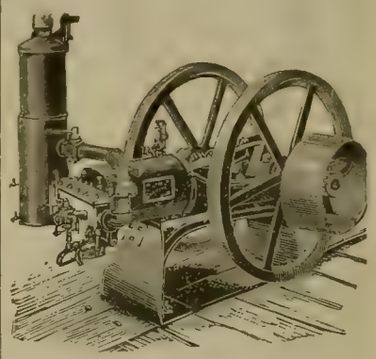
Cheap Power!



SAVE MONEY BY USING

—THE—

"DANIEL BEST" Crude Oil Engine.

This Engine can be operated on either Crude Oil, Distillate, Gasoline, or Kerosene. **It is the cheapest power on earth** and is not tied to any one kind of Oil, but can use any kind that will make gas and is not handicapped by being compelled to use a certain Oil. Do not forget this when in need of an Engine.

We guarantee our Engines to work perfectly on California Crude Oil, or Distillate, or any other kind of gaseous Oil; we however prefer CALIFORNIA CRUDE OIL, from Coalinga, Fresno county, for the reason that gas from Crude Oil will produce more power from the number of feet of gas used than from any other Oil, and it is also a natural lubricant as well, the valves being always lubricated sufficiently to prevent them from sticking, thus assuring greater durability of the working parts than it otherwise would be in using dry gas. And another advantage we claim is, that danger from explosions is reduced to a minimum, there being no accumulation of gas, but is used by the Engine as fast as it is generated and hence is absolutely safe. The following is a test that we made with one of our Five-Horse Power Crude Oil Engines, running ten hours on the different gas oils:

California Crude Oil, 40 grav..	7½	galls. at	5c.,	$.37½
Distillate.....	40	"	7½ "	8c., .60
Domestic Coal Oil....	40	"	7½ "	12½c. .93¾
Gasoline.....	74	"	8¾ "	15c., 1.31¼
City Gas.....	1000	feet.		2.00

We manufacture all sizes from two-horse power up, and will guarantee that our Engines will run cheaper and are more simple in construction, have fewer parts and hence are more durable than any other Gas Engines on the market. Seeing is believing; don't take our word for it, but come and investigate for yourselves. You can always see one in operation at our works. We will be pleased to see you and will at all times take pleasure in showing them up. Our Engines are specially adapted for running well and mining machinery—in fact, for any kind of power desired. We are the pioneers and first inventors of Crude Oil and Distillate Engines. **We always lead and never follow.** Send for Catalogue and Price List of the only genuine Crude Oil and Distillate Engine made.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong&Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CAN CASING MACHINE.—John P. Simmons, San Francisco, Cal., assignor to L. C. Parke of same place. No. 589,226. Dated August 31, 1897. This invention relates to an apparatus which is essentially designed for casing cans after the latter have been filled and labeled ready for the market. It consists essentially of a series of tables, a chute arranged with relation thereto, mechanism by which the table and chute are brought into line so as to allow the cans to pass by gravitation from the chute to the tables until the latter are successively filled, and a means for delivering the contents of the tables simultaneously into the case.

DUPLICATE PAD OR SHEET.—Horace P. Brown, San Francisco, Cal. No. 589,372. Dated August 31, 1897. This invention relates to an improvement in a duplication or manifolding of marks or entries upon separate sheets, such as shipping receipts, cash memoranda, pads and sheets generally where any repetition of the mark or entry is required. It consists essentially of the application by printing or other means to one surface of a sheet of a non-drying transparent ink or other suitable material, which serves to duplicate upon a following sheet any entry or mark made upon the face of the first-named sheet or sheets anterior thereto. In conjunction with this is shown an impenetrable flap or surface loosely hinged to the front end of the book adaped to be folded between the series of sheets to prevent a transfer beyond the particular series required.

GOVERNOR.—S. J. Tutthill, Oakland, Cal., assignor to the Tutthill Water Wheel Co. of San Francisco. No. 589,378. Dated August 31, 1897. This invention relates to a governor which is especially applicable for the controlling of momentum of high speed water wheels. It consists in a means for increasing or decreasing the amount of water discharged upon the wheel, a cylinder with a reciprocating piston and intermediate mechanism through which the movement of the piston actuates the water supply device, a divided pipe, one branch of which connects with the bottom of the cylinder, and the other branch forms communication between the bottom and the top, a water-containing tank with a pump by which circulation therethrough is maintained, and valve mechanism in a branch of said circulating pipe to increase or decrease the area of the discharge passage whereby the reduction of said passage forces a portion of the water into the cylinder to actuate the wheel-containing mechanism, and a governor driven from the wheel shaft and connecting with the valve in the circulating pipe to increase or decrease the flow therein in unison with the varying movements of the wheel.

ROPE GRIP AND TAKE UP.—John Samuelson, San Francisco, Cal., assignor of one-half to Cornelius Kramer of same place. No. 589,224. Dated August 31, 1897. This invention relates to a device which I call a rope grip and take up. The object is to provide a means which can be readily attached to a rope whereby any slack of the rope may be instantly taken up and the rope firmly gripped in the device and held in position. It is especially applicable for setting up rigging on ships or for the handling of running rigging and ropes where they are to be drawn in or shortened and for otherwise operating the grip and hauling the rope in any desired direction. It consists of a base plate having converging guides and slots, also converging gripping jaws slidable between the guides having channels made in their meeting faces with corrugations adapted to grip and hold the rope pins passing through the jaws an through the angular slots, links connecting with said pins at one end and with another pin at the opposite end, said pin being movable in the central longitudinal slot and a locking nut by which the parts are secured at any desired point.

REVERBERATORY SMELTING AND REFINING APPARATUS.—Benjamin Hall, Nevada City, Cal. No. 589,210. Dated August 31, 1897. This invention relates to improvements in reverberatory smelting and refining furnaces which are especially useful in the treatment of pyritic ores. It consists in the combination with a horizontal reverberatory furnace of a mechanism for regularly feeding the ore to one end, a discharge pipe at the opposite end, a blast pipe or pipes delivering air into the feed end of the furnace along the line of travel of the ore, a supplemental furnace chamber in line beyond the discharge adapted to receive the overflow of slag and matte whereby the level of the matte is approximately maintained, a chimney or stack at the outer end of the second chamber through which the products of combustion escape after acting upon the matte and the slag, and a final discharge passage for the slag at the end of the chamber.

CARTRIDGE.—Martin P. Boas, San Francisco, Cal. No. 588,764. Dated August 24, 1897. This invention relates to the construc- of cartridges for firearms. It consists essentially of a plurality of unitedly seated independent projectiles, a shell having an explosive charge common to all of these projectiles, a means at the rear end of the shell for exploding the charge and a grooved seat plate in the forward end of the shell in which the projectiles are independently and unitedly seated, said seat plate having peripheral grooves in which the material of the shell is crimped. The explosion of the powder charge acts to propel all of the bullets simultaneously from the ground.

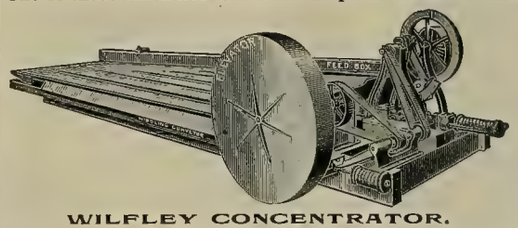
SOLE AGENTS IN CALIFORNIA FOR THE CELEBRATED

WILFLEY CONCENTRATING TABLE.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.



WILFLEY CONCENTRATOR.

SEND FOR CIRCULARS.

IDLEWILD GOLD MINING COMPANY—SUPERINTENDENT'S OFFICE.
TAYLOR MINE, CALIFORNIA, September 6th, 1897.

White & Rogers, San Francisco, Cal.—GENTLEMEN: Answering yours of the 27th ult., *in re* Wilfley Concentrating Table in use at the above mine, I beg to state that we have run the pulp from fifteen of our 1000-lb. stamps, making ninety-eight 5-in. drops per minute and crushing to pass through a No 1 perforated tin screen, over one Wilfley Table for the thirty-one days ended August 31st. While the machine has been handicapped by a load far in excess of its rated capacity, said load amounting to about fifty-one tons daily, we are pleased to note that it has given us a sulphuret worth .344 per cent more than the joint product of five other machines of different types, operating under practically the same conditions. The concentrates from the Wilfley are entirely free from silica, while those from the other concentrators have carried an average of .082 per cent. We feel that further comment as to the merits of the Wilfley Table is quite unnecessary. Yours very truly,

E. W. CHAPMAN, Supt.; per Kendall.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,

330 Market Street.....San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.

Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Notes on Assaying and Assay Schemes.

By P. De Peyster Ricketts, E. M., Ph. D., Professor in Assaying in the School of Mines, Columbia College, N. Y. Prepared with special reference to the wants of the student and practical assayer. Containing also Rules for the Examination of Mines, Assayer's Outfit, Treatment of Ores, etc. Fifteenth edition. 8vo., cloth.....$3 00

Prospector's Field Book and Guide.

By H. S. Osborn.....$1 50

A Practical Guide for Prospectors and Miners.

By C. W. Moore. With numerous illustrations.....$4 75

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

The Lixiviation of Silver Ores with Hyposulphite Solutions.

With special reference to the Russell Process. Second edition. Completely revised. By Carl A. Stetefeldt. Price, bound in cloth.....$5 00

Modern Copper Smelting.

By Edward Dyer Peters, Jr. Seventh edition. Rewritten and enlarged. Profusely illustrated....$5 00

Electricity in Mining.

By Sylvanus P. Thompson.....50 cts.

Practical Treatise on Hydraulic Mining.

By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid.....$5 00

Practical Hydraulics.

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Metallurgy of Silver.

By M. Eissler. Profusely illustrated.....$4 00

The Explorer's and Assayers' Companion.

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

Aaron's Leaching Gold and Silver Ores.

By C. H. Aaron. The most complete handbook on the subject extant; 164 pages, octavo. Illustrated by twelve lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, postpaid.....$3 00

Manual of Assaying—Gold, Silver, Copper and Lead Ores.

By Walter Lee Brown, B. Sc. One colored plate; 132 illustrations on wood. Fifth edition. 12 mo. 533 pp. Price, postpaid.....$2 50

The Metallurgy of Gold.

By M. Eissler. Profusely illustrated.....$5 00

A Text Book of Mineralogy.

Based upon the System of Mineralogy of Prof. J. D. Dana. Embracing an extended Treatise on Crystallography and Physical Mineralogy. By Edw. S. Dana, Curator of Mineralogy, Yale College. With upward of 800 woodcuts and one colored plate. Seventeenth edition. 8vo., cloth.....$3 50

Notes on the Treatment of Gold Ores.

By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

A Practical Manual of Minerals, Mines and Mining.

By H. S. Osborn.....$4 50

Cyanide Processes for Gold and Silver Ores.

By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Practical Metallurgy and Assaying.

By A. H. Hiorns.....$1 50

The Practical Metal Worker's Assistant.

By Oliver Byrne. Illustrated.....$5 00

Quartz Operator's Handbook.

By P. M. Randall.....$2 00

Assayer's Guide.

By Oscar M. Lieber.....$1 50

Assayer's Manual.

By Bruno Kerl. Illustrated.....$3 00

Metallurgy of Silver, Gold and Mercury in the United States.

Showing the latest practice pursued in American Metallurgical Establishments. With 186 engravings and folding plates, tables, etc. By Prof. Thos. Egleston, School of Mines, Columbia College. With corrections. Vol. I.—SILVER. 8vo.....$7 00

Metallurgy of Silver, Gold and Mercury—Continued.

Vol. II.—GOLD, MERCURY, Etc. Illustrated with 140 engravings and folding plates; 935 pages, 8vo., cloth.....$7 50

Manual of Determinative Mineralogy.

With an Introduction on Blow-Pipe Analysis (constituting the Determinative Part of Dana's Mineralogy). By Prof. Geo. J. Brush. Thirteenth edition, translated into the new system. 8vo., cloth...$3 50

Skeleton Mining Report.

Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid....50 cts.

Stamp Milling of Gold Ores.

By T. A. Rickards, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid.....$2 50

Miners' Pocketbook.

A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. Warnford Lock. 472 pages, illustrated, flexible leather.....$5 00

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 8, 1897.

General business continues to steadily enlarge, with a disposition manifested to carry more in stock. The strength of all lines of goods with a continued firming up is doing no little in creating a feeling of greater confidence. This feeling is made stronger by the high prices all kinds of farm and orchard products command, with a large demand ruling. The increased prices it is estimated will put into circulation several million dollars in excess of last year. Not only is the farming community reaping great benefits from higher prices for their produce, but gold mining is still forging ahead, with more money offering for investment. Well-known mining experts are kept busy reporting on claims. Manufacturers of mining machinery report that figuring on new work is larger, if anything, than at the corresponding time last year. It is stated that the outlook is quite promising for an increase in orders for farm implements the coming season, and also for structural material.

The local money market shows continued activity with a free call for funds for crop moving purposes. The higher cost of grain calls for larger sums when compared with former seasons, but this is freely met without creating friction. So far as we can learn there is no disposition to strengthen the rates of interest but rather to put out all the money possible on approved security. This disposition, no doubt, is actuated by a belief that there will be a large supply of idle funds this winter which may cause a further shading in the rates of interest, particularly if Eastern money markets do not appreciate, and it looks now as if they will rule low after crop moving. Our Eastern exchanges report a heavy movement in grain and other farm products which is causing a car famine.

Refined Silver, per oz., 1000 fine	54¼
Mexican Dollars, nominal at	42

SILVER.—Has advanced the past week. On Wednesday, Sept. 1st, it was 51¼ cents per ounce fine in New York, and yesterday (Tuesday) it was 54¼ cents. This is quite a recovery, yet better informed operators hold to the opinion that it will go to 50 cents or less before bottom figures have been touched and a recovery based on a substantial footing can be expected. The production has been greatly reduced, yet it is in excess of present requirements; yet, if there should be a speculative movement, higher prices could be easily brought about.

Pixley & Abell report shipments of silver from London to India, China and the Straits for the year to August 12th as follows, compared with the corresponding period of last year. In view of the recent extraordinary developments in silver, we take from the same circular the shipments for each of the last ten years. It will be noticed that China has greatly diminished its takings of silver this year, as also have the Straits settlements. The table is as follows:

Year.	India.	China.	Straits.	Total.
1887	£4,068,289	£293,266	£568,570	£4,930,125
1888	4,348,529	319,121	661,527	5,329,177
1889	5,834,334	355,874	1,681,114	7,871,332

MEXICAN DOLLARS.— The market is nominal, correct quotations being out of the question. There is a fair demand.

QUICKSILVER. — The market is unchanged.

Our market is quoted at $88 for domestic consumption.

COPPER.—Eastern advices state that the export demand has been quite heavy. The home demand is steadily improving. The market is firm to steady.

Our market is quoted as follows:

Ingot casting, jobbing	13@—
Ingot " wholesale	12½@—
Sheet copper	—@16½
Bolt	¼ and 5-16, 20c; ⅜ and larger, 16½

TIN.—The market is weak, with a light demand for both pig and plate.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

LEAD.—The market continues to hold to steady prices, in sympathy with the East, where strong and higher prices rule.

Our market is quoted in jobbing lots as follows per 100 pounds:

Pig	5 00 @ 5 25
Sheet	6 25 @ 6 50
Pipe	5 50 @ 6 00

SHOT.—The market is firm.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 40
Drop, B and larger sizes, " "	1 65
Buck, Balls and Chilled, do, " "	1 65

POWDER.—The market is firm.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

COAL.—The market is practically without any change to note. The supply of both foreign and domestic is is ample for all nearby requirements.

We quote as follows:

SPOT FROM YARD—PER TON.

Wellington	$8 00@— —
Greta	6 00@ 6 50
Nanaimo	6 50@ 7 00
Gilman	5 50@ 6 00
Seattle	5 50@ 6 00
Coos Bay	—@ 4 75
Cannel	8 00@— —
Egg, hard	12 00@13 00
Wallsend	6 50@— —

TO ARRIVE—CARGO LOTS.

Australian	5 50
Liverpool Steam	6 25
Scotch Splint	— —
Cardiff	6 25
Lehigh Lump	9 00
Cumberland	13 00
Egg, hard	10 00
West Hartley	6 50

COKE.—The market is quoted as follows:

Gas Companies'	— — — —
English, to load	9 50 @ — —
" spot, in bulk	10 00 @ — —
" in sacks	11 00 @ 12 00
Cumberland	— — @ — —

IRON.—The market is steady to firm with continued large consumption. Australia has bought 2,000 tons at the East—the first purchase made in this country. The *Iron Age*, just to hand, says: The stimulus of growing confidence and an increased volume of business is spreading, and the iron industry is rapidly getting into better shape. Even foundry pig iron, which has been lagging behind conspicuously, is making a start in activity. Making due allowance for a number of influences eager to secure an upward movement, it is a fact that the market has hardened. It is true also, however, that a number of producers in the Eastern and Southern territory still claim to be unable to obtain higher prices. From Chicago comes the report that an agreement has been reached between the local and the Southern makers to advance prices and keep the market in good shape. A leading Southern company has announced its price for No. 2 foundry as $7, Birmingham. There are indications, too, that speculators in Wall street are taking some interest in pig iron, believing that there is money in this lagging metal.

AMERICAN.

	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50

ENGLISH.

Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

ANTIMONY.—The market is firm.

Our market is quoted at 8¼c in a jobbing way. New York mail advices quote 7¾c for Cookson's, 7¼c for Hallett's and 7c for Japanese.

NAILS.—The market is firm.

Wire, carloads, basis per keg	....
" jobbing, " "	$2 35
Cut, carloads, " "	....
" jobbing, " "	2 25

BORAX.—The market is steady.

The market is quoted as follows:

Refined, in carload lots, in barrels	5
Refined, in carload lots in sacks	4¾
Powdered, in car lots	5
Concentrated, "	4½

PLATINUM.—The market is steady.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

ZINC.—The market is firmer.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

Chemicals.

SULPHURIC ACID.—The demand is improving.

We quote in a jobbing way at 1¼c per lb for 66%.

ACETIC ACID.—The market is firm at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported steady from store at 6½@7c per pound in carboys.

BLUE VITRIOL.—Our market is steady.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is firm.

Our market is quoted in a jobbing way at $1.40 a pound.

BONEASH.—The demand is fair.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

PHOSPHORUS.—The market is firm.

We quote in a jobbing way at 70 to 75 cents per pound.

SODA ASH, 58% (LeBlanc process).—The market is firm at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steady at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—There is a fair demand at 2½c a pound from stores.

NITRATE OF SODA.—The market is steady.

Mining Share Market.

SAN FRANCISCO, Sept. 8, 1897.

Occidental advanced the past week to $2.75 a share, causing a sympathetic movement in Savage and Gould & Curry based on an improvement in the latter on the Brunswick lode. Savage moved from about 25 cents to 76 cents. The strengthening in Gould & Curry and Savage caused a better tone with the others which resulted in quite a sharp advance on Friday and Saturday, with honors outside of Con. Virginia being about evenly devided. Monday being a holiday there was no board, but Tuesday the market was fairly steady at the morning session until Occidental was called and when it sold at $2 against $2.70 on Saturday there was a weaker feeling which became more pronounced at the afternoon session. If the statement is correct that the ore vein on the 650-foot level has been crosscutted and found to be over 30 feet wide giving an average assay value of $20 a ton in gold, then Occidental shares as a gamble lose their attractiveness. This will be particularly the case if another report is true that the Occidental mill is to be put in order for crushing ore. When they began taking out ore on Chollar the shares went down, and this has been the case with the shares of every mine from which ore was extracted and milled. It is the uncertainty and not the certainty that makes the gamble. What the strength in Yellow Jacket and several other shares on the Comstock lode is based on is hard to say, unless it is in sympathy with the others, for it is safe to affirm that no work will be pushed ahead now that is calculated to strike a body of ore of any importance. It is stated that in Justice a donkey engine is to be used to facilitate work, and if the expected showing justifies the company will start work in the old Woodville shaft, owned by it, to make thorough and systematic exploration of the mine.

From the Comstock mines the news is of about the same tenor as has been reported for several weeks past. The work in several is of an important character provided it is not stopped or its course turned, as has been done on more than one occasion before. Some of the work indicates blocking out but for what purpose it is hard to say unless for more economical and expeditious working later on —probably at sometime within the next two or three years. It is a well known fact that in two of the mines considerable ground was blocked out several years ago which will act an important part when the time comes, if ever it does in the lifetime of the reported controllers, John W. Mackay, D. O. Mills, J. L. Flood, Colonel Hayward and others. No official information has come to hand regarding the crossdrift started in Utah. In Sierra Nevada they are exploiting on both the Layton tunnel level and the 900-foot level. On the former the prospects are quite favorable but it would be more so if the work was towards the west. There is no change in the work in Union, it is still south on the 900-foot level. On the 1000-foot level of Mexican there has been no change the past week worthy of attention. The south drift on the central tunnel of Ophir is being pushed slowly ahead. Work is continued west on the 1000-foot level. At last advices the crossdrift was in over 400 feet with no material change to note. In Con. Virginia they have commenced operations on the 1750-foot level. At present they are working to connect with the 1650-foot level. It would be singular if enough ore should be struck on this level, which when followed down, would justify pumping out the water on the lower levels. The work on the 1650-foot and 1550-foot level is about the same as heretofore reported by us. There have been sent to the Selby Smelting & Lead Works 332½ tons of concentrates for reduction. If work is continued by Best & Belcher and Gould & Curry in their joint east crossdrift they will get to the Brunswick lode. They are now in about 610 feet. In Savage the work is on the same level heretofore reported. No work is being doing in either Hale & Norcross or Chollar. Hale & Norcross is controlled down here by the Fox combination and at Virginia City by the Grayson-Hayward combine, making it a cat and dog fight which shareholders will eventually have to pay for. In Potosi the work as outlined is quite important provided it is done for the interest of outside shareholders. The work indicates that the 450-foot and 1100-foot levels are to be exploited. It is singular that no news is published from Bullion. It looks as if there is something more than they want the public to know. The promised stoping of ore in Alpha is forgotten but instead the public is treated to old stereotyped reports.

Reports are current that important work is to be started in Andes, but official letters do not indicate it. The news from Con. Imperial, Challenge and Confidence is about the same as published last week. From Yellow Jacket nothing has come to hand to indicate what they want assessment money for. There is nothing new from Kentuck, Crown Point, Belcher, Seg. Belcher or Overman.

On the Brunswick lode there are three points of interest, viz., the work in Occidental, Savage and Best & Belcher. That in Occidental is given in the introduction. In Savage the formation is more favorable for a body of good ore than has yet been found on that lode. As it is towards Gould & Curry it makes the latter strong. The joint work of Con. Virginia, Best & Belcher and Gould & Curry is confined to the 300-foot and 600-foot levels. They are working on the 400-foot, 500-foot and 600-foot levels in Chollar. On the latter level they will be soon out far enough to start a crossdrift. Only 84 tons of ore were

WILL NEGOTIATE with owners or their duly authorized agents only.

WILL INVESTIGATE only thoroughly bonafide properties, either Mines, Prospects or Mineral Lands, whose owners are willing to make reasonable terms. When sending reports on properties also send terms on which you are willing to sell or lease.

Working Capital for Mines.

PACIFIC EXPLORATION COMPANY

Will form companies and find capital to develop mines on shares or commission. Miners who have a good prospect should write the manager of this company for particulars. Address W. E. HOLBROOK, Manager, 29-30 Chronicle Building, S. F.

extracted the past week. It assays about the same as that given in last week's review.

The market was weak this morning until Sierra Nevada was called, which advanced, causing a better feeling. After call it advanced to $1.15, but closed at noon at $1.05. It is stated that there is an improvement in the mine. The entire list strengthened up and it looks as if they may do slightly better.

The following illustrates the changes of the week:

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from N. B. Willits, et als., in the Willow Placer Extension, near Howard's Station, Sierra Co., to deposit tailings in Little Deer creek; from G. A. Rosenthal, et als., in the California Mine, near Sierra City, Sierra Co., to deposit tailings in east fork of North Fork of Yuba river; from Jacob Yager, in the Schneider Diggings, near Spanish Ranch, Plumas Co., to deposit tailings in Spanish creek; and from Henry A. Halsted, in the Halsted placer mine, near Spanish Ranch, Plumas Co., to deposit tailings in a ravine, gives notice that a meeting will be held at room 59, Flood building, San Francisco, Cal., on September 27, 1897, at 1:30 P. M.

HEALD'S

BUSINESS COLLEGE.

24 Post Street, - - - San Francisco

Has opened a Department of Civil and Mining Engineering, Chemistry, Metallurgy, Navigation, Mill Construction, Assaying, Blow-Pipe Analysis, Geology, Trigonometry, Geometry, etc., under the direction of Prof. O. H. Packer, an engineer of national reputation. Full information furnished on application.

The College has now Departments for Bookkeeping and Business Practice, Shorthand and Typing, Penmanship, Modern Languages, English Branches, Telegraphy, and Electrical Engineering.

Students can enter at any time. Pupils receive individual instruction. Twenty teachers. Moderate charges. Write for Catalogue and Journal.

Assaying Gold

AND

Silver Ores.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Perface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press**, 330 Market St., San Francisco.

Assessment Notices.

GOLD RIDGE CONSOLIDATED MINING AND Milling Company.—Location of principal place of business, San Francisco, California; location of works, Nevada and Sierra Counties, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 3rd day of August, 1897, an assessment (No. 5) of 4 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, rooms 12 and 13, No. 43 Sixth street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of September, 1897, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 9th day of October, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

H. SYLVESTER, Secretary.

Office—Rooms 12 and 13, No. 43 Sixth street, San Francisco, California.

RED CAP MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Red Cap Creek, Humboldt County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 25th day of August, 1897, an assessment (No. 1) of Nine Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, No. 125 Beale street, City and County of San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of October, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 23d day of October, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. deK. TOWNSEND, Secretary.

Office—125 Beale street, City and County of San Francisco, California.

SAVAGE MINING COMPANY.—LOCATION OF principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees, held on the 2nd day of September, 1897, an assessment (No. 93), of 20 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, No. 309 Montgomery street, Room 50, Nevada Block, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of October, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of October, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

E. B. HOLMES, Secretary.

Office—No. 309 Montgomery street, Room 50, Nevada Block, San Francisco, California.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia City, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of September, 1897, an assessment (No. 44) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, rooms 20-22 Nevada block, 309 Montgomery street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 4th day of October, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of October, 1897, at 1 o'clock P. M., to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Rooms 20-22, Nevada block, 309 Montgomery street, San Francisco, California.

ALTA SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 3d day of September, 1897, an assessment (No. 57) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to Secretary, at the office of the company, room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of October, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 27th day of October, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. E. JACOBUS, Secretary.

Office—Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

PATENTS

DEWEY, STRONG & CO'S

PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & Co.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

DEWEY, STRONG & CO.,

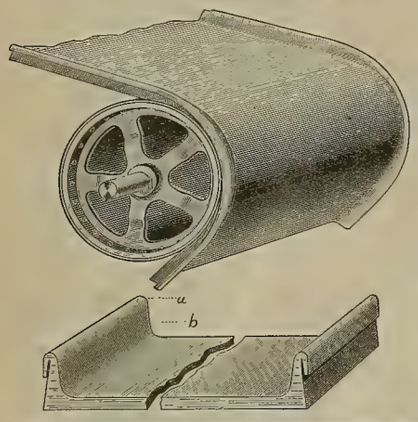
THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.



It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to-day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

SUPT. OFFICE WILDMAN GOLD MINING COMPANY,
SUTTER CREEK, AMADOR CO., CAL., Feb 22, 1897.

MR. JAS. S. BROWNELL, 132 Market St., San Francisco, Cal.—DEAR SIR: Replying to your favor of the 18th inst., will say that in the two mills operated by this company we have nineteen of your Patent Lip flange concentrator belts in use; some of them have been in constant use for the past two years and have given entire satisfaction. I know of no better flange for a side shake machine.

Yours truly, JOHN ROSS JR., Superintendent.

MEXICAN MILL, EMPIRE, NEV., March 28, 1897.

MR. J. S. BROWNELL, San Francisco, Cal.—DEAR SIR: For some years we have used three different styles of belts on our Frue vanner at the Mexican mill, and for smooth working and endurance the Brownell Patent Lip flange belt has proved its superiority over all others, and I unhesitatingly recommend it to all who are using Frue machines.

Yours truly, EUGENE MAY, Foreman.

THE HIGH ORE AND GREEN MOUNTAIN HOISTS.

THE BLUEBIRD 150-TON MILL, SHUT DOWN SINCE SILVER DECLINED.

THE MOUNTAIN CON. HOIST.

OLD ALICE HOIST AND MILL.

NEW ALICE MILL.

Some Montana Silver Mines.

On this page are portrayed some Montana mining properties that are having a hard struggle for existence in these dark days of silver. The Bluebird mill has been shut down, awaiting an advance. It was bought for $100,000, and developed into a property for which $2,000,000 was refused. The Alice mine at Walkerville has sufficient "by-product" in the shape of gold to enable it to continue, though it passed its August dividend. It employs 150 men and the output of the mine and mill is paying expenses. With advance in silver quotations the payment of dividends will be resumed. A great many improvements have been made. At the Valdemere the shaft has been timbered 120 feet, preparatory to sinking 300 feet deeper, but, with silver at present quotations, mine work is limited to what is barely necessary to keep it in good condition. The Alice was the mine which first proved the permanence of Butte's mines when water level was reached in 1879. Marcus Daly was its first superintendent. It has been worked for over twenty years, has about twenty miles of shafts, drifts, levels, winzes, etc., and has paid nearly $1,000,000 in dividends. The Moulton, illustrated on page 265, is a silver property, owned by W. A. Clark. It adjoins the Alice and has been a large dividend payer in the past. But 1893 hushed its stamps and silenced its drills, so that but little active mining has been done since. The High Ore and Green Mountain mines are part of the Chambers Syndicate group. They now belong to the Anaconda Company. The High Ore will be remembered by old Montanans as the Bell. The Mountain Con., one of the group of copper properties forming the Chambers Syndicate, is now also the property of the Anaconda Company. The cuts herewith are furnished through the courtesy of Mr. Guy X. Piatt of Butte.

A Just Decision.

The most important mining matter that has transpired during the week, so far as California is concerned, is the decision of Secretary of the Interior Bliss, who has ruled regarding mineral lands and railroad grants. The ready compliance of Mr. Lamoreaux, of unhappy memory, who seemed to anticipate the desires of the corporations in subservience to their wishes, is in unsavory contrast to the rigid justice of the present Commissioner of the General Land Office and his superior, the Secretary of the Interior. These men are evidently determined to do right unawed or unbribed.

The case on which the decision of the Secretary was made was that of a marble company against the Northern Pacific Railroad Company and the State of Washington, involving the title to mineral lands in the State of Washington; the question being whether marble was a mineral, and also the more important one, what the terms of grants were to the railroad company and the State. The Secretary decided that marble is a mineral within the meaning of mining laws and therefore not subject to the selection of patent by a railroad company, which was almost obvious. The important part of this decision was that this rule applies to all substances known as mineral by recognized authorities.

The far-reaching effect of this decision is of course manifest. It will confine the future patenting of lands to railroad companies to lands more valuable for agricultural than mineral purposes. It is a pity that before the recent wholesale absorption of California mineral lands by corporations, some uninfluenced and honest officials like Commissioner Herman and Secretary Bliss were not in a position to officially prevent such absorption.

Secretary Bliss' decision this week is a tremendous rebuke to the unfaithful men who took advantage, under a previous Administration, of their official position. In the two years from June 30th, 1894, to June 30th, 1896, Mr. Lamoreaux permitted railroad corporations in this State to patent 3,226,269 acres of the public domain, of which probably one-fourth was more valuable for mineral than for agricultural purposes.

This ruling is of considerable importance to all parts of California, and followed up will enable those interested in the southern part of the State to secure the return to the public domain of several large tracts of oil and asphalt lands. It will also tend to prevent in the northern part of the State the further corporate absorption of mineral lands.

Is Not Retroactive.

During the week Secretary of the Interior Bliss has made final decision in the case of W. H. Goudy vs. The Kismet Mining Company, Cripple Creek, Colorado, which is of considerable importance. The case involved the publication of applications for patent. A great number of such applications had been published in a Cripple Creek paper. Secretary of the Interior Smith decided about a year ago that certain governmental requirements had not been complied with and that all the applications in question would have to be readvertised, which of course would occasion great expense, delay and the possibility of adverse litigation. Technically, it appears that Secretary Smith was correct, as certain exact requirements were not observed in the publication of the applications in question. Upon examination it was evident that not only in the Cripple Creek cases, but in a great number of other cases all over the country, the same omissions had been made, so that had Secretary Smith's decision been carried into effect it would have compelled readvertising of probably 75 per cent of all the mining claims in the United States, for which application of patent had been made, but for which patent had not been issued.

There were four separate hearings given this case, and the decision this week by Secretary Bliss reversed Secretary Smith's, which makes it unnecessary to readvertise any of the old claims; but all such applications of patent of mining claims published since the 1st of June, 1897, must be advertised in exact, precise accordance with all governmental regulations pertaining thereto.

This will be a matter of relief to thousands of miners all over the country, and is also of importance to those who have not yet secured patent for their mining claims, or who are about to make application therefor, it being necessary for them to comply in every respect with all governmental requirements.

Another Generation.

The great influx of new men into the business of mining is noticeable. Thousands of young men, especially, all over the country, are starting from a variety of motives into what may be styled the business of mining; probably this fact accounts as much as any other one thing for the enormous increase in the circulation of this paper; and this leads to the consideration of a question which has more than once come up. Old experienced mining engineers and practical miners in every part of the country have at times, by letter and in conversation, evinced some slight surprise that now and then appears in these columns some article on some subjects of practical mining that, while every word is true and practical, tells little that they do not already know. It has been the privilege of the MINING AND SCIENTIFIC PRESS for the last thirty-seven years to publish a great deal of practical information on mining subjects, and it has been the custom of the most prominent miners and mining engineers to contribute through its columns accounts of their individual work and records of their practice, thus making a great fund of practical information as to scientific mining. And thus for over a generation it has kept pace with the increasing importance of this branch of American industry. But years pass on and new men constantly come into the ranks. What an old experienced mining engineer might consider almost "a kindergarten proposition" is just precisely what an enthusiastic beginner would consider the very thing that he wanted to know.

Thousands of young men all over the country are now taking their first lessons in mining, and the very article in this paper that would be considered unnecessary, as containing nothing new, by the veteran, is seized upon with avidity by many who know just as much about mining now as the more mature reader did when he was of their age.

THE prophecy continues to be heard that silver will go to twenty-five cents per ounce. Nothing is more unlikely. There are several reasons why silver is more likely to appreciate than depreciate. The foremost is that trade conditions are against it as a cold business proposition, imperatively removed from the domain of politics; the trade of silver-absorbing countries cannot and will not be lost by exporting nations. The tremendous shrinkage in coin value of silver might be overcome by the increment of future earnings, but the permanent trade conditions existing between world producers and consumers preclude the possibility of further decline in the price of silver from the low figures reached last week.

Amending Federal Mining Law.

The meeting of the Denver committee—which, so far as the recent convention in that city is concerned, has charge of the proposed amendment of the Federal mining laws—which was to be held on the 7th inst., has been postponed to the 23rd inst. So much has been said in these columns regarding the necessity of many important changes in the Federal mining law that it seems like repetition to further discuss the matter. A great deal of proposed legislation has been blocked out for the California committee having charge of this matter to report at the coming convention of the California Miners' Association to be held in this city on the 18th prox., and it is assumed that they, as well as the Denver committee, will give due attention to the most prominent needs in this very important matter of amending the Federal mining law.

Amid the multitude of necessary reforms stands most prominently the necessity of radical change in the United States Statutes governing the apex law and the question of side lines. As the statute now stands the owner of a mining claim may follow and develop any lode having its apex or outcrop within the surface lines of his location, regardless of where such lode may extend in its downward course. This paper has all along held that for this law should be substituted one providing for square locations confining the rights of claim owners within their surface boundaries, and thus make our mining laws conform in this regard with the rest of civilization and bring our statutes into harmony with our practice as regards all other land claims, the owners of which have no right to go outside of their surface lines.

It is only necessary to point to the history of mining litigation in this country to illustrate the need of such a change. It may be asked, why, if necessary, has such a change not been made? Well-meant and almost successful endeavors have been made from time to time, backed up by the best thought and sentiment of the mining public; but the process of legislation in the National Congress is very slow, and time and again such a revised statute as suggested has been passed in one house of Congress, only to be delayed from passage in the other by adjournment, or the interposition of what the general public or the legislators themselves have deemed of more importance.

Meanwhile the courts have continued to be crowded with litigation growing out of this apex law. Decisions without number have been rendered in every court, including the great final court of appeal, the Supreme Court of the United States, where a minority have at times dissented from the prevailing judgment. As is also well known, the best geologists, mining engineers, mining "experts" and others who by occupation and education are assumably well informed, have given diametrically opposed testimony in important cases; it being a usual occurrence when a case involving great sums of money is in court to find equal expert and intelligent testimony on both sides, and without the slightest intimation of other than an honest opinion.

A great deal of trouble for the miner would be swept away by the repeal of the present apex laws. True, it would likewise remove a great deal of lucrative business for the mining lawyer; and this matter has in late years resolved itself into a question as to which is worthy of more consideration—the miner or the mining lawyer.

This is worthy of earnest and active consideration and positive action by the Denver committee at their meeting this month and a similar committee which reports to the convention of the California State Miners' Association next month.

Concentrates.

COKE at Northport, Wash., costs $10 per ton.

CHINESE miners are invading the South African labor field.

"LONG-LOST" mines are now being discovered in Venezuela.

PROBABLY to retort it is the best way to clean foul quicksilver.

NATIVE wages on the Rand, South Africa, average $7 per month.

CALIFORNIA'S gold yield for '96 was $17,181,562; for '92, $12,571,900.

THE famous old Washoe Club of Virginia City, Nevada, has closed its doors.

THE Anaconda mine, Montana, yearly uses one million pounds of powder.

THE aggregate value of California's mineral production for 1896 was $24,291,398.

DURING July the Alaska-Treadwell mine milled 21,000 tons ore; net profit, $60,500.

JOHN D. ROCKEFELLER is credited with trying to corner the Canadian nickel mines.

DURING August 257 notices of assessment work were recorded at Nelson, B. C.

IN the U. S. Circuit Court last June the Caminetti act was held to be constitutional.

O. J. SMITH is reported to be making a success of his smelting plant at Eureka, Nev.

MERCUR and Gold Mountain are at present Utah's two most prosperous mining camps.

AT Cripple Creek, Colo., five new railroads are under way to encircle the district and tap the mines.

AT Coalinga, Fresno Co., Cal., Chancellor & Canfield have struck a well flowing 110 barrels of oil a day.

ANGELS, Calaveras Co., Cal., is tired of forty-seven years of village government and proposes to incorporate.

THE first quartz mill in California run by electricity was that of the Dalmatia mine, El Dorado Co., in 1890.

THE Secretary of the Virginia, Nev., Miners' Union is at Standsburg, Cal., to institute a branch union there.

A WHITE ROCK correspondent of the Placerville, Cal., *Republican* has discovered that mice will eat amalgam.

THE Copper Queen mine, Bisbee, Arizona, has on the payroll about 1200 men. The main shaft is down 216 feet.

PLUMAS Co., Cal., papers deny the recent report that the Halstead property had been sold to a Scotch syndicate.

THE Canadian Government will try to maintain dog trains between Dyea and Dawson City, N. W. T., the coming winter.

IN pan amalgamation of gold the use of cyanide of mercury with cyanide of potossium solution will be found of advantage.

A MEETING of the Committee on Revision of Mining Laws has been called to assemble in Denver, Colorado, next Thursday.

PRES'T REPASS of the Kettle River M. & M. Co. will put in a 50-ton chlorination plant, costing $20,000, at Grand Forks, B. C.

WHEN the Congress mine gets down to the proposed 3000-foot level it will be the deepest mine west of the Rocky mountains.

IT is expected that the monthly output of the Alaska-Treadwell mine will be $125,000 when the 300-stamp mill is completed.

C. L. HODGE will replace the recently destroyed mill on the Last Chance, Bingham, Utah, with one of 100 tons daily capacity.

CONTRARY to custom many southern Colorado mines and mills will not shut down the coming winter, but will continue in operation.

THE question whether or not mineral claims may be located within the boundaries of the recent forest reserves has not yet been settled.

"THE days of '98" will probably be the reminiscent rhythm of the many who propose facing the dangers of the upper Yukon next spring.

THE current quotation for black peroxide of cobalt is $2 per pound; carbonate, $2.55; chloride, $2; nitrate, $2.20; oxide, $2.25 per 100 pounds.

"POGONIP" is said to be rife on the Yukon. If it is the same kind of frozen fog experienced in White Pine, Nev., it is a breeder of pneumonia.

A NEVADA Co., Cal., correspondent announces a discovery of nickel there. The current New York quotation for that metal is 38 cents per pound.

MINING LAWYERS agree in the belief that the U. S. statutes intend that where the expression a "known mine" is used, it is synonymous with an operated mine.

A DITCH six feet wide at the top, three feet at the bottom and three and one-half feet deep will carry from 2500 to 2800 miners' inches of water according to its grade.

WHEN the extent and magnitude of operations are considered, there are relatively fewer and less fatal accidents in mining than in any other branch of human industry.

THE reports of the United States mine inspectors show the total coal product of New Mexico during the last fiscal year to have been 733,939 tons, estimated value $1,196,915.

SUPT. TURNER, who fell down the shaft of the National Nickel Company's mine near Lovelock, Nev., last week, is dead from the injuries which resulted from his terrible fall.

THE Boston & Montana Company is reported producing at the rate of about 5,000,000 pounds of copper a month, over 3,000,000 pounds of which is said to be electrolytically refined.

IT is probable that many Dawson City miners will go down the Yukon and winter at St. Michaels, where they can at least secure food. There are 3000 tons of provisions at the latter place.

T. F. BENNINGTON, who operated a mine at Dog Hill, Butte county, Cal., last week during the noon hour undertook to draw out some giant powder cartridges, which exploded, instantly killing him.

THE steamer Excelsior, from St. Michaels, Alaska, with returning miners from Dawson, N. W. T., arrived in San Francisco last Wednesday, with sixty-three passengers and about $500,000 in gold.

THE Denver & Rio Grande and the Colorado Midland Railway Companies have agreed to establish an emergency rate on low grade ores from Aspen to Pueblo and Denver of $3 per ton on ores running 35 ounces silver or less, until silver reaches 57 cents an ounce, the roads reserving the right to restore the $5 rate after thirty days' notice.

THE government engineers have approved the plan projected by the State Commission of Public Works for improvement of the Sacramento river, and it is assumed that active operations will shortly begin.

IN British Columbia an inch of water is officially defined to mean one-half the quantity that will pass through an orifice 2 inches high by 1 inch wide, with a constant head of 7 inches above the upper side of the orifice.

LEAD'S lowest price was thirteen months ago, when the average exchange New York price was $2.73. There are several good reasons for the belief now so confidently expressed by many that it will go to $4.50.

WHERE a mining claim is located in this State after Nov. 2nd of this year it will be possible to do the $50 worth of work required by the California statute, and make it a part of the $100 assessment work specified in the federal statutes.

AT the Baliol mine, Sutter Creek, Amador Co., Cal., last April, forty stamps crushed 5885 tons ore in twenty-seven and a half days, at a cost of 26⅓ cents per ton. The cost of mining and delivering the same to the mill was 33¼ cents per ton.

SAYS the Marysville *Montanian*: This has been the poorest season for placer mining in Alder gulch for the last fifteen years, owing to the scarcity of water. From nearly every part of this west half of America comes the same statement.

THE annual meeting of the El Dorado County Miners' Association will be held in Placerville, Cal., next Saturday. Officers will be elected and delegates chosen to the State Miners' Association convention in this city on the 18th prox.

A $70,000 fire at the Iron Mountain mine, Shasta Co., Cal., on the afternoon of the 13th inst., destroyed the company's building, including the sawmill, old 40-stamp mill, men's quarters, and temporarily suspended the work of 350 men.

T. G. B. MASSICKS of Prescott, Arizona, is credited with contriving a gravel-washing and amalgamating machine, which on a recent run of forty-nine minutes from an open cut automatically dug and run through 79 cubic yards of gravel, from which $15.55 was realized.

A FRENCH company now building a ditch to take water from Trinity river, Cal., will use twenty-five miles of iron pipe which is ¼ an inch thick and 32 inches in diameter; it is estimated that it will cost $2,000,000 to complete the work, this being but one of similiar California hydraulic enterprises.

AT Creede, Colo., the *World* says the managers have signed an agreement to cut wages in wet mines from $3.50 to $3 per day, in dry mines from $3 to $2.50. Trammers in wet mines are cut from $3 to $2.75 and in dry mines from $2.50 to $2.25. Other mine labor, including the bosses, is cut in proportion.

THE California State Board of Equalization has lowered the tax rolls of all the counties in the State, except San Francisco and the mining counties of Alpine, Amador, Calaveras, Contra Costa, Del Norte, El Dorado, Inyo, Lassen, Mariposa, Mono, Nevada, Placer, Plumas, Sacramento, Sierra, Siskiyou Trinity and Tuolumne.

THE annual report of the Anaconda Copper Mining Company of Montana shows that for the year ending June 30 the receipts were $22,940,383 as against $16,945,697 the year before: the profits amounted to $5,136,048, an increase of $878,133 over the previous year. Dividends amounting to $3,000,000 were declared, as against $750,000 in '96.

L. J. COURT of Prescott, Ariz., has the gigantic idea that the Grand Canyon of the Colorado is a great sluice box, and proposes to locate 300 miles of that slit in Arizona, stretch steel cables across, suspend ground sluices with copper plates attached and occasionally pulling up the aforesaid plates scrape off gold, and "set 'em again."

IF a Northport, Wash., statement is to be believed, four men at the north end of Christina lake, B. C., have a deposit of "nearly pure aluminum." This remarkable find has not yet attracted unusual attention, though the deposit "has been traced a distance of 1300 feet." The substance is probably a sulphate of aluminum, which sometimes contains 30% alumina.

AMONG the most noticeable features in California this year are the large amount of preparatory work in hydraulic enterprises, the sinking of shafts to greater depth, the discovery by several foreign investors that as much money is to be made by developing prospects as by buying "going" mines, and the establishment of dredging machines in several parts of the State.

FOR the first time in financial history, leading members of the conservative side of New York finance are publicly associating themselves with investments in gold mines. Chauncey M. Depew, ex-Postmaster General James, H. Walter Webb, Smith M. Weed and John Carstensen are among those who in a published prospectus invite the public to buy shares in a gold mining development company.

IN giving a case over into the hands of an attorney, two things are taken for granted: 1. That the client has confidence that the attorney selected is competent to handle the case, which confidence has been installed in the mind by personal knowledge and public reputation. 2. The attorney, in accepting the case, confirms the assumption that he has the required ability and is in every way competent to act.

IN two recent cases State Supreme Court decisions have been to the effect that where the vein enters a claim on one side, passes out on the same side, and does not run approximately parallel to the side lines, such side line must be treated as the end line, with the laws of the United States (Section 2322) providing that the owner of the apex of a vein cannot follow the dip outside the vertical plane of the "end lines."

AT the car works at Pullman, Ills., there is now building by the Bowman-Ormsbee Gold Harvesting Company a gold milling plant to be taken to Charlotte, North Carolina. The train of machinery occupies two-thirds the length of the car, the other third being taken up by an office and stateroom, with berths for eight persons, a buffet and an assayer's laboratory. As auxiliaries to the Pullman car are two other cars, on which the ore is reduced by chlorination and leaching.

IT is but natural that a big gold placer deposit like that of the Klondike should have its accompanying frauds and swindles, but the brazen dishonesty of some of the concerns advertising broadcast almost transcends belief. A great many people do not object to being fooled, but they like to have it done in a gentlemanly manner. The raw methods of some of these Klondike investment companies is an insult to ordinary intelligence. Of course, it is unlikely that any practical miner or reader of this journal will be cajoled into a dollar's investment in such schemes, which are mostly as meritorious as a proposition to extract sunbeams from cucumbers.

THE Board of Public Works and the Government and State engineers held a conference in San Francisco this week over the proposition to remove the Newtown shoals, near Rio Vista, Cal. The plan has been approved, with a few modifications, and a favorable report from the Government engineers will in all probability lead to an appropriation from Congress to carry on the work. Had the Government engineers not endorsed the plan, no appropriation could have been expected.

THE Weaverville, Cal., *Journal* sensibly says: "Trinity's mining future is assured, and the next ten years will see a tremendous development of her leading industry. Trinity never needed a boom and cannot be injured by the puncture of one. Her mines are too well known, her gold output is too well established. She rests upon her merits only. All the county needs is a better system of communication with the railroad and a systematic development of her mineral resources."

"THE biggest nugget ever found in the Klondike" came down on the steamer Excelsior to San Francisco on the 15th inst. It weighs almost 34 ounces and is valued at $583.25. Put alongside one of the many big nuggets found in California—in Tuolumne, Trinity, El Dorado, Placer or Sierra counties, chunks of gold worth from $10,000 to $40,000 each—"the biggest nugget ever found in the Klondike" would look like a pea beside a pumpkin. Bigger nuggets are daily found here, but this is California, and that is far away.

ASSISTANT ATTORNEY GENERAL VANDEVENTER has recently given an opinion, which has been endorsed by the Department of Interior, to the effect that persons who have, in taking up homesteads, taken only a fraction of the 160 acres, to which every one is entitled, may make an additional entry to make the full quota of 160 acres. It has always been construed that when one homesteads lands, he forfeits his entire privilege, whether he takes up the full amount or not. It is claimed that it was the intention of Congress that every homesteader should acquire 160 acres of land if he desired it.

IN the issue of the 4th inst., the concentrate stating the price of lead "$3.85 brokers, exchange $4.22½," may be thus explained: The "exchange" quotation is the actual price. The "brokers'" price is a sort of current fiction, assumedly the wholesale price, but only a reminiscence, as "steamer day" is still referred to in the San Francisco of 1897. As between the smelter's price, the price in Chicago or St. Louis, as compared with the price in Salt Lake City or San Francisco, it is to be said that the smelter's price is entirely a business agreement between buyer and seller; quotations at distributing points are usually for refined lead in carload lots, and when lead is quoted at a certain price in Salt Lake City, it is about 25 cents per 100 pounds more in St. Louis and about as much more in New York City.

THE Mount Morgan, Australia, is the greatest gold mine in the world. It was bought about twelve years ago for $3115, and since then $75,000,000 has been refused for the mine and works. The most recent report of the company, to hand for the calender year 1896, states that the second, third and fourth sections of the new reduction works, which will be capable of treating 100,000 tons of low-grade ore per annum, will be completed in January, '98. A plant for treating the mundic ore is being designed, and it will be able to treat ore yielding 7 dwt. to the ton at a profit. The report says that since the opening of the new reduction works large bodies of hitherto unpayable ores had been able to be treated profitably. The removal of this ore has revealed the existence of immense bodies of payable ore. The report of the superintendent of treatment showed that the quantity of gold rock treated was 105,244 tons for 159,046 ounces.

"IS THERE such a thing as intrinsic value?" Certainly. It is intrinsic qualities which give intrinsic value. Generally, what is meant is that the article embodies in the form in which it is offered for sale, not only original intrinsic qualities, but the actual labor and expense of its production. It is a term, however, which is applied in many different ways, and often is used when "exchangeable value" is meant. An article may have intrinsic value and yet have no exchangeable value. Water is one of the necessities of life, but it is usually so easily obtained that it has no commercial value. A man will be slow to give up a thing, which has cost him labor, for water, when he simply has to dip it up or stoop down and drink. The moment, however, that water has to be forced long distances to the places where it is needed, it immediately possesses both intrinsic and exchangeable value. The cost of transportation may add to the value of an article just as surely as labor.

THE Kennedy mine, Amador Co., Cal., some time ago reached a depth of 2200 feet, and will be 2400 feet deep ere long. The Idaho mine at Grass Valley, Cal., is 2182 feet deep. The Kennedy is probably the deepest purely gold mine in the country. The deepest shaft in the world is believed to be in Paruschowitz, Upper Silesia, where a depth of 6753 feet is reported to have been attained. The previous record for depth was the hole drilled some years ago at Schladebach, near Leipsic. The latter bore hole was made in a search for coal, and eighty-three separate seams, some of considerable thickness, were penetrated. The hole was 12 inches in diameter at the beginning, and this was lined with a tube about 0.4 inch thick; at a depth of 230 feet the bore was reduced to 8¼ inches in diameter, and this continued for 351 feet. At this point the blue marl encountered became so compact that the diamond drill had to be used; and, under the action of the water, the marl swelled to such a degree that the diameter of the pipe had to be again reduced. The greatest difficulty encountered was the great weight of the boring rods as the depth increased. Though steel was used, at a depth of 6560 feet the total weight of the rods reached 30,155 pounds. Under this weight ruptures of the rods were frequent, and an accident of this nature finally stopped the work. About 4500 feet of rods fell to the bottom, and, being jammed under a part of the tubing, it was impossible to withdraw it. The diameter of the well at the bottom was 2¾ inches. Temperature observations made showed 15° F. at the surface, and at a depth of 6571 feet the temperature reached 157° F., equivalent to an average augmentation of heat of 1° F. for every 63 feet. The boring at Paruschowitz was commenced on March 26, 1892, and it reached its maximum depth in 399 working days. The Calumet & Hecla's Red Jacket mine is 4900 feet in depth.

Robinson Gold Mining Company's Report.

We are indebted to Capt. Thos. Mein for the directors' interim report for the six months ending June 30th, 1897, of the Robinson Gold Mining Company, Limited, Johannesburg, South Africa, as follows:

MINE WORK.

The development work done during the half-year is:

	Feet.
Drives	4,061
Raises	1,295
Crosscuts	1,860
Total	7,216

An estimate of the ore in sight at the close of the half-year has been made by the company's surveyor and is as follows:

	Main Reef Leader, Tons.	South Reef, Tons.
East mine	159,840	104,173
West mine	104,925	99,537
	264,765	203,710

Making a total of 468,475 tons, and showing an increase of 26,969 tons on the stocks reported at the end of 1896.

The quartz mined and sent to the mill amounted to 90,300 tons, obtained from the following reefs:

	Main Reef, Tons.	Main Reef Leader, Tons.	South Reef, Tons.	Total, Tons.
East mine	....	31,771	12,375	44,146
West mine	4,010	19,313	22,831	45,154
	4,010	51,084	35,206	90,300

From the above tonnage was recovered:

BULLION.

From—	Total. ozs.	dts.	Per Ton Milled. dts.	grs.
Mill	64,599	7	14	7.38
Concentrates—by chlorination	6,302	..	1	9.50
Tailings—by cyanide process	17,621	6	3	21.67
Slags	70	4	..	0.37
Total	88,592	18	19	14.92

VALUE.

From—	Total. £	s	d	Per Ton Milled. £	s	d
Mill	234,130	1	4	2	11	10.27
Concentrates—by chlorination	26,295	2	8	..	5	9.89
Tailings—by cyanide process	56,232	6	4	..	12	5.45
Slags	284	11	7	..	..	0.75
Total	316,942	1	11	3	10	2.36

The company's revenue from slimes was derived from the sale of slimes only. The average monthly tonnage treated works out at 6299 tons. During June the pumping plant for the delivery of fresh slimes direct to the works was in operation, and benefit accrued from treating the slimes before they became of an acid nature. In the treatment of the accumulated slimes, great difficulty is experienced through their extreme acidity and working costs are materially higher than in the case of slimes delivered direct from the mill. In terms of contract, the company has the option of taking the slimes plant at the end of February, 1898, by paying the Rand Central Ore Reduction Co. the amount it shall then figure at in their books, but as the exercise of this option would involve a cash expenditure of something over £40,000 in one lump sum, they are as yet undecided whether it will be advisable to acquire the plant or not.

EXPENDITURE AND REVENUE.

Crushed 90,300 Tons.

WORKING EXPENDITURE.

	£	s	d	Per Ton Milled. £	s	d
Mining account, including mine maintenance	56,570	11	9	..	12	6.35
Milling account, including mill maintenance	16,892	17	9	..	3	8.90
General maintenance account	2,595	13	7	..	..	6.90
General charges	7,592	19	6	..	1	8.18
Special charges: Bonus to employes, exchange on dividend, com. on coupons, etc.	3,272	14	10	..	..	8.70
	86,924	17	5	..	19	3.03
Expenditure on mine development, including main shafts	20,935	7	3	..	4	7.64
Expenditure on machinery, plant and buildings	9,236	2	5	..	2	0.55
	117,096	7	1	1	5	11.22
RETREATMENT ACCOUNT.						
Working expenses at cyanide and chlorination works	20,961	18	8			
Cost of concentrates purchased, including receiving	62,385	12	10			
	200,443	18	7			
Cash profit for half-year	207,305	1	9			
	407,749	0	4			

REVENUE.

	£	s	d	£	s	d
Gold account, mill, 64,599 ozs. 7 dts	234,130	1	4			
Sundry revenue	3,283	7	2			
				237,413	8	6
SLIMES PLANT ACCOUNT.						
37,794 tons slimes				5,507	11	4
RETREATMENT ACCOUNT.						
Gold account, tailings, 17,621 ozs. 7 dts	56,232	6	4			
Realized from cyanide slags	284	11	7			
Go'd account, own and purchased concentrates, 25,932 ozs. 19 dts	108,311	2	7			
				164,828	0	6
				407,749	0	4

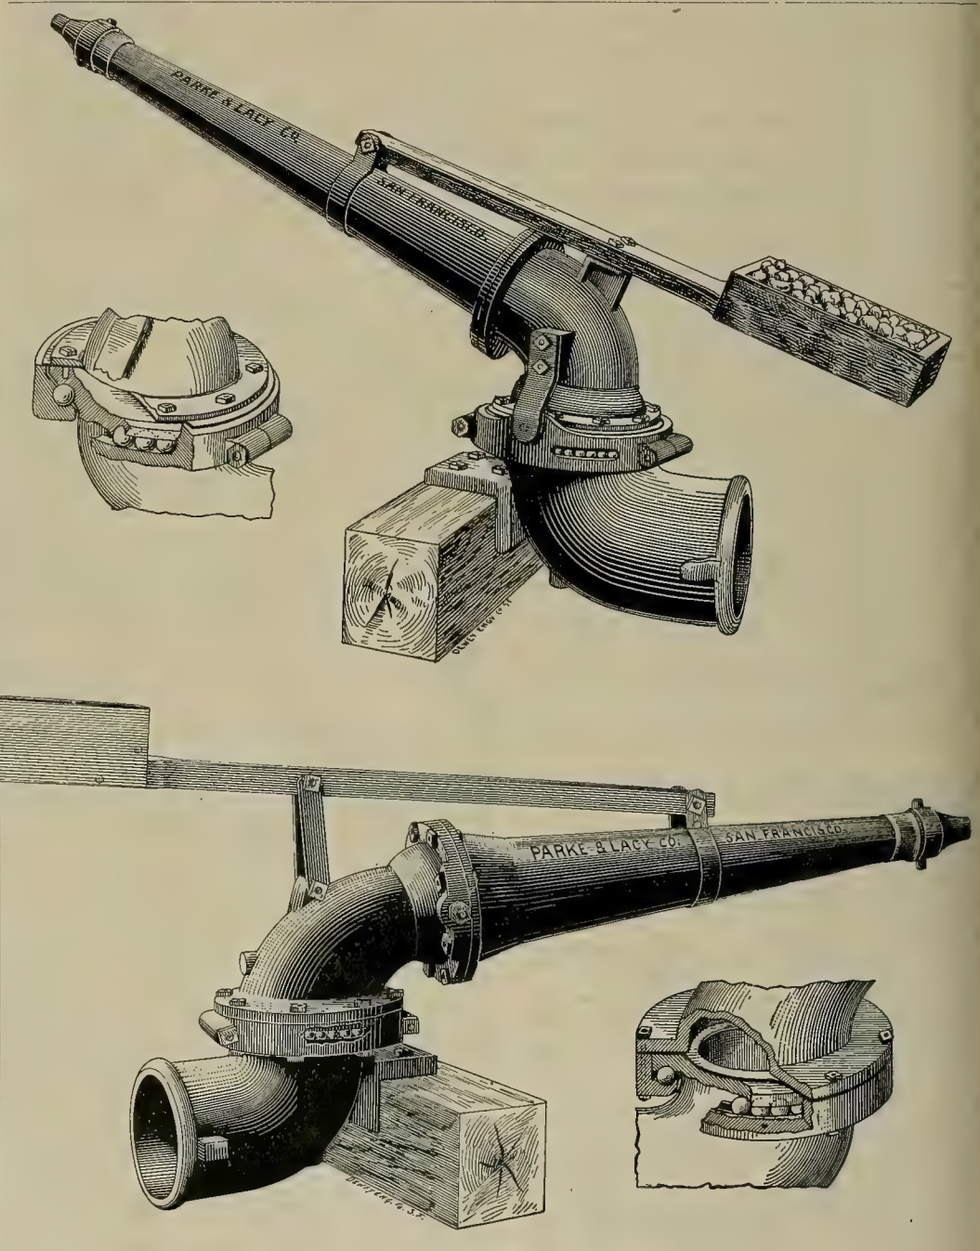
The net profit on the half-year's working amounts to £207,305 1s 9d. Of this sum dividend No. 14 of 7s per share, declared on June 28th, absorbed £192,500, leaving a balance of £14,805 1s 9d., to be carried forward to the second half-year. As far as can at present be seen, the profits for the second six months will average about the same as for the period under review.

Native Labor.—The reduction of native wages introduced at the beginning of June has, so far, been successfully carried through. "We have lost a considerable number of Kaffirs—a usual occurrence during the winter months—and, owing to the restrictions placed upon boys traveling through districts infected by Rinderpest, we have been unable to replace the shortfall, and have had, in consequence, to employ part of the rock drill plant in stoping. The Government's consent to boys being brought from the east coast is to be asked, and, should it be granted, we intend availing ourselves of the opportunity to introduce a different class of native labor."

Simmon's Ball-Bearing Hydraulic Giant.

Simmon's ball-bearing hydraulic giant was patented July, 1897. In the double-jointed giants the ball bearing is arranged in a groove under a flange surrounding the upturned end of the stationary or supply pipe, and a groove ring bolted to the flange of the upper or movable section of the giant. The groove formed by the flange and movable ring is filled with hard iron or steel balls, forming a rolling contact between the movable section, arranged around the upturned end of the supply pipe, which takes the vertical or upward thrust due to the pressure, as well as the end thrust due to the spouting force of the water. The pressure of the water is distributed upon thirty-seven balls in the No. 1 or 7-inch giant, and in a proportiontely larger number in other sizes. A free space is left between the stationary pipe and the movable elbow to prevent contact of any surfaces but the ball bearing. The leather packing is in the same form as in the old style double-jointed giants. By arranging the ball bearing in this manner the inventor aims to dispense with the obstructing king bolt in the center of the pipe. In place of the screw and lock nut a steel pin is provided which passes through the rim of the swivel plate and into the side of the ball. The other end of the pin is riveted to a steel plate which is bolted to the side of the giant, thus giving a support to both ends of the swivel pin. Owing to the shape and position of these ball bearings in the giants, they can be made of sheet steel riveted in sections.

In addition to the hydraulic giant above described, the builders, the Parke & Lacy Co., 21 and 23 Fremont street, San Francisco, have another new form of hydraulic giant, which they consider to be of a superior style. It is a single-jointed giant, but in a reversed form, viz.: the globe, which in the old style of single-jointed giant is part of the lower or stationary section is, in this new form, attached to the upper or movable section. By this arrangement is obtained a large and unobstructed passage for the water, while the working parts are low down, thus giving strength and steadiness. The trunnion or swivel screw is, in this new form of giant, two and one-half times larger and is made of solid steel forging, with no swivel screw or lock nut to come loose. The vertical strain and the end thrust are taken up by a series of ⅛-inch ball bearings arranged under a projecting rim of the lower section of the giant in such a manner that there is no contact of metals other than the rolling surface of the balls. The water packing is held in place by a separate ring, and, in addition to making a water packing, covers the joint of the ball bearing. These are estimated to be about 20 per cent lighter than the old double-jointed giants, having the same strength of material. In this, as in the other form, the obstructing center bolt is dispensed with. Messrs. Parke & Lacy wish to direct special attention to the statement that this is the pioneer invention of the ball-bearing hydraulic in giants, and that all others are necessarily infringements.



SIMMON'S BALL-BEARING HYDRAULIC GIANT.

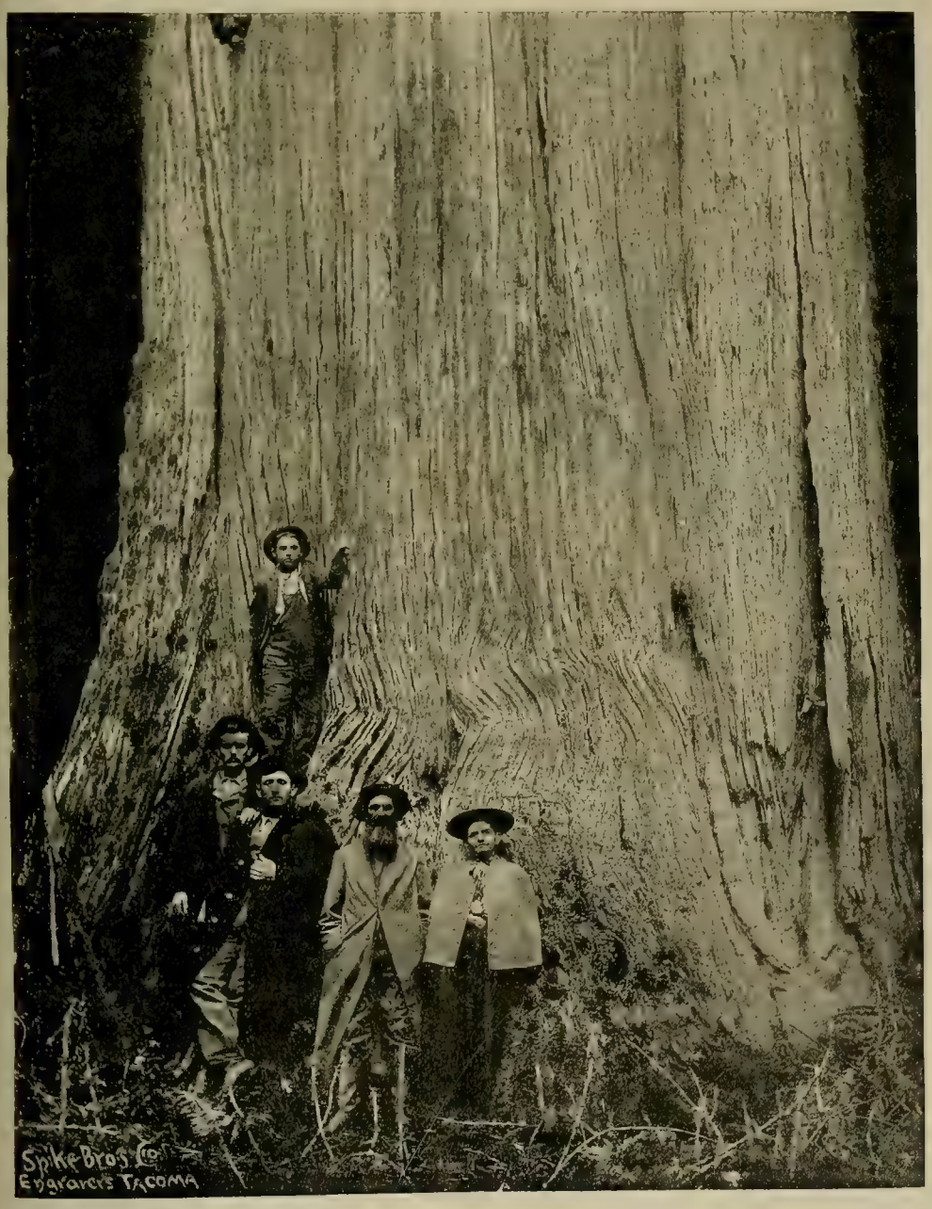
THE term "limited" in connection with a partnership or corporation applies solely to the extent of the liability of the members as determined by the articles of incorporation. This limitation is not equally distributed among those concerned in the business, but may vary in amount as agreed upon,

one being liable for one-half of the capital stock and the remainder being distributed among a dozen or more of the remaining shareholders. The law that gives the authority or privilege of making these limitations also requires that the word "limited" shall always be used in connection with the firm or corporation. Wherever it is seen it stands as a post of warning to all that they must look out and satisfy themselves as to the liability of the firm members. There is nothing unfair in adopting it; it is fair and just that outsiders should not presume that, because a man of means has become identified with a firm, his liability is equal to that of a less responsible member. One may desire to undertake a certain venture and be willing to risk his investment, but nothing more. The word "limited" enables him to do so.

Arbitration Preferable to Litigation.

As to the respective rights of owners of mining claims, lying one above the other upon a stream or mountain, in Colorado in the case of a placer claim the owner of the claim lying above the other upon a stream must not allow the tailings from his sluice to wash down and be deposited upon the claim below. Though he is permitted to use the water of the stream for sluicing purposes and is not liable for any damages for having muddied the same, without some prior claim, other than that incident to the working of his placer he cannot divert the water from the gulch, or use it for other purposes to the detriment of claim owners lying below. As to lode claims, the owner of a claim lying above another upon the mountain must not allow rock or water to pass from his workings down upon the property below so as to damage it in any way, or there will be liability. The owner of a claim lying below another, who provides drainage for both properties, in case both are being worked at the same time, can collect from the owner of the property lying above the proportionate cost of such drainage. A right of way is given across any and all claims, to and from another, for the purpose of hauling quartz. Generally the principle is that the owner of the location lying higher up shall not use the natural advantages of his location to the detriment of his neighbor below, and if he should do this he will be liable for the damages caused by his acts. To tell what the respective rights of each owner may be with any degree of certainty would require a knowledge of the facts in each particular case, and most miners should come to an agreement upon such matters. If each views the case from each other's standpoint, they can usually agree upon what is right without becoming involved in litigation.

THE MOULTON HOIST AND MILL.—(See Page 261.)



CEDAR TREE NEAR SNOQUALMIE FALLS ON SEATTLE & INTERNATIONAL RAILWAY, CIRCUMFERENCE OF BUTT 100 FEET 7 INCHES.

How Emery is Quarried.

Co-operators may be pleased to know that among the few trades in the world in the hands of the laborers is that of the emery quarryman. Emery comes from the island of Naxos, in the eastern Mediterranean, whence it has been exported for the last two centuries or more. The beds are in the northeast of the island, the deposits descending into some of the neighboring islands, the emery being found in lenticular masses, resting on layers of schist in limestone, almost identical w th Parian marble, the finest marble known, which comes from the island of Paros, close by. There are about 300 men engaged in the trade, all of whom have to be married before they are admitted into the fraternity.

The material is much too hard to be dug out, or even blasted. Great fires are lighted around the blocks until the natural cracks expand with the heat, and levers are then inserted to pry them apart.

This system is continued until the blocks are reduced in size to masses of a cubic foot or less, and they are then shipped as if they were coals. There are said to be 20,000,000 tons yet available at Naxos, and last year's export was 3,950 tons.

It is one of the hardest substances yet known, coming next to the diamond, and among its crystalline forms known to the jewelers are the ruby and the sapphire.—Pearson's Weekly.

A Huge Cedar Tree.

That California has not a monopoly of the big trees on the coast is strikingly exemplified in the accompanying cut of a giant cedar near Snoqualmie Falls, Washington State, the circumference of which, at the base, is over one hundred feet. The picture of this old monarch of the northern forests is furnished by the *West Coast and Pacific Shore Lumberman* of Tacoma, Wash.

ONE of the most remarkable things about a man's walk is the diagonal movement which characterizes it. The hands and feet may be regarded as forming the four corners of a parallelogram, and the diagonal limbs are, of course, the right arm and left leg and the left arm and right leg. By "diagonal" movement is meant that the diagonal limbs during locomotion always swing in the same direction. The arms swing by the body like a couple of pendulums, and with a speed which entirely depends upon the rate at which he may be walking. The athlete, anxious to complete the given number of "laps" in a mile or couple of miles and outstrip his competitor, swings his arms to and fro with a quickness which corresponds with the motion of his swift feet; the business man always swings his arms with a motion which, if not so quick, exactly times with the motion of his legs. Now, if the motion be even carelessly observed, it will be found that the right arm swings forward the same time as the left leg, and when the right leg is advancing it is the left arm which accompanies it. This diagonal movement of the limbs is the natural method adopted by man when walking, and it is the first and most apparent fact that one ascertains in studying human locomotion.

The Solution of Gold in Accumulated and Other Slimes.

The following is a paper read by Mr. W. A. Caldecott before a recent meeting of the Chemical and Metallurgical Society of South Africa:

The problems presented in the treatment of accumulated slimes are in a great measure of the same nature as those which occur in dealing with slimes direct from the mill. In one important respect, however, there is usually a considerable variation, and this is as regards the primary operation of dissolving the gold. As is well known, the gold in slimes fresh from the battery is generally very readily soluble in cyanide solution. When slimes are settled in dams or pits, however, certain reactions take place which result in the formation of decomposition products corresponding with conditions obtaining. Among the products of importance, so far as subsequent cyanide treatment is concerned, is ferrous sulphide (FeS) derived from the decomposition of pyrites (FeS_2). This compound imparts a dark gray or black color to those layers in the slimes dams in which it occurs in any quantity and may be readily identified therein by the odor of sulphuretted hydrogen on adding acid, by the darkening of moistened lead acetate paper exposed to these fumes and by the purple reaction in an alkaline solution with potassium nitro-prusside. The exact stages by which it is derived from the pyrites may be open to discussion. My own view as to its formation may be expressed by setting forth as follows the main stages of gradually increasing oxidation through which iron pyrites, either as pyrite or marcasite, passes before it finally attains its final stage of highest oxidation under natural conditions:

(1) FeS	Iron pyrites.
(2) FeS+S	Ferrous sulphide and sulphur.
(3) $FeSO_4+H_2SO_4$	Ferrous sulphate and sulphuric acid.
(4) $Fe_2(SO_4)_3$	Ferric sulphate.
(5) $2Fe_2O_3, SO_3$	Insoluble basic ferric sulphate.
(6) Fe_2O_3	Ferric oxide.

As may be seen by detailed references to authorities mentioned in a communication by myself to the Proceedings of the London Chemical Society of 29th April, 1897, it has long been known that ferrous sulphide is produced by the reduction of iron sulphates in nature by decomposing organic matter, but I am not aware that its derivation from pyritic ore or its presence in slimes dams has hitherto been publicly recognized. The formation of ferrous sulphide proceeds very rapidly after the deposition of slimes in the dams, where they settle, forming a compact mass practically impervious to air and water. After a few days the more pyritic layers of slimes contain as much as .25 per cent FeS, soluble ferrous salts and free acid being almost nil. Certain gold ores naturally contain a large amount of ferrous sulphide in the form of magnetic iron pyrites (6FeS, FeS_2), copper pyrites (CuS, FeS), or arsenical pyrites ($FeAs_2S_2$).

When dry iron pyrites are heated in absence of air or are finely pulverized in an iron mortar, ferrous sulphide is readily produced. The same reaction takes place to a slight extent during the operation of crushing in a mill, particularly when the water for the plates has been heated beforehand to assist amalgamation, and in some cases there may be sufficient FeS thus found to affect the treatment.

During the treatment of slimes by cyanide the presence of finely divided ferrous sulphide causes abstraction of oxygen from the solutions, whereby the solution of the gold is prevented. Other ferrous compounds, such as ferrous hydrate (FeO_2H_2), react in the same way as does the decomposing organic matter always present in a more or less degree in slimes dams. The obvious remedy for these difficulties is to supply oxygen artificially, either in the form of air delivered from a perforated pipe fixed near the bottom of the agitation vat containing lime pulp, or in the form of an oxidizing agent. The cheapest and most suitable of the latter has been found to be potassic permanganate. The present slime plants of the Rand Central Ore Reduction Co. have employed æration of all pulp in their dissolving vats as part of the regular treatment since the latter part of last year, accelerated when this operation took too long or when much organic matter was present with one-eighth pound to one-half pound $KMnO_4$ per ton of dry slimes. All plants now under construction for the treatment of accumulated slimes will be equipped with large air compressors delivering up to 1800 cubic feet of air per minute. The advantage of deep vats where æration is employed so as to get as much efficiency as possible out of the air is obvious, as is also the necessity for delivering the air in small bubbles so as to bring the maximum amount of surface into contact with the slime pulp. Again, it has been found by experiment, as might have been anticipated, that for a charge containing a certain amount of ferrous compounds and other reducing substances a corresponding volume of air was required, whether applied in one hour or distributed over ten hours. Hence the advisability of ærating as quickly as possible in order to lessen the time and power required for keeping the slimes in suspension by agitation.

Speaking generally, old accumulated slimes are considerably more acid than accumulated tailings, and although in the stirring process all possible efficiency is got out of the lime employed to neutralize this acidity, yet consumptions of from 8 lbs to 20 lbs of lime per ton of dry slimes are by no means uncommon. The ferrous sulphate in the slimes and on ferrous sulphate formed by oxidation of ferrous sulphide through aeration has a tendency to abstract nitrogen from the solutions and also to consume cyanide by converting it into ferro-cyanide. By a further aeration this ferrous hydrate is converted into innocuous and inert ferric hydrate. Hence in the treatment of accumulated slimes preliminary aeration or its more costly equivalent in the form of an oxidizing agent has lowered the cyanide consumption by about 50 per cent, a saving which more than pays the cost of aeration; even with the acid slimes above-mentioned, the actual cyanide consumption is now only ½ lb per ton of dry slimes, or less than the cost of the lime employed. Of this ½ lb only about one-half is consumed by the slimes themselves, the remainder being discharged as dilute solution with the residues, or lost by exposure to the air, and by decomposition in the precipitating boxes.

The use of air for accelerating the solution of the gold in auriferous material has long been talked of and experimented upon, and forms the subject-matter of various patent specifications. In the treatment of most accumulated slimes, however, the gold simply does not dissolve without its application, so that, instead of merely accelerating the reaction, it becomes as necessary for their treatment as cyanide itself. It is probable that before long aeration, now regularly used for the first time on a working scale, will also serve as a means of agitation in place of mechanically driven paddles at present employed, but this application of its use, as well as various other adaptations, now under investigation, is still in the experimental stage.

At the present time the method of dealing with accumulated slimes differs only in the earlier stages from the treatment of fresh battery slimes, the subsequent operations of settling, decantation, precipitation, etc., being much the same. These earlier operations, which vary in detail according to the particular slimes under treatment, are generally as follows: The truck loads of slimes are dumped into a small constant-discharge pulping vat containing fast-running paddles. A pipe delivers a continual stream of weak solution at the bottom of the vat near one side, and at the top on the other side is an overflow launder, through which the slime-pulp continually discharges, as the lumps become disintegrated, into the dissolving vat. Here it is aerated whilst being stirred by air delivered from an air compressor through a perforated pipe fixed near the bottom of the vat, until sulphides are no longer apparent in the pulp on applying the acid and lead acetate paper test. This aeration may take from two to twenty hours, and varies with every charge. After the sulphides are oxidized, an hour or two longer aeration is given to oxidize any ferrous hydrate remaining, and the cyanide is then added. This brings the solution up to .005 per cent KCy to .008 per cent KCy, which, though containing only a couple of ounces of potassic cyanide to a ton, is found amply strong enough to dissolve the gold. During the charging and subsequent aeration lime is also added to bring the alkali strength of the solution up to .006 per cent to .010 per cent, as any higher percentage of lime is found to be unnecessary for expediting the subsequent settlement of the slimes. The agitation and aeration are continued for a period of from two to five hours after the addition of cyanide, as experience shows, and the slime-pulp containing all the gold in a state of solution is then transferred to another vat and diluted, preliminary to settling. Any permanganate to be added is put in as soon as the dissolving vat is full, as it is found that but little of the ferrous iron present is oxidized whilst much organic matter is present.

Such, in brief, are the operations involved in dissolving the gold in slimes containing reducing substances; and it may be stated that the acquisition of the experience requisite for successfully dealing with such material has been very costly, both in money and in labor. The solution of the gold in the treatment of slimes can now be ensured, but much still remains to be done in the investigation of the various constituents of slimes and their interaction with one another and with the agents—lime, air and cyanide—used in slimes treatment. In the running of a slimes plant it is obvious that considerably more skill and attention are required both of manager and shift men than with a sand plant of equal capacity. Besides, constant attention to the machinery and appliances for stirring, transferring and decanting, continual tests for and records of sulphides, alkali and cyanide are necessary, and the whole treatment of a charge must be completed in a fraction of the time required for sands.

In conclusion, one or two details of laboratory practice in connection with slime work may be given. The percentage of dry slimes, or the ratio of slimes to solution, in any pulp may be determined with fair accuracy from its specific gravity x by applying the following formulæ:

$$\text{Percentage of dry slimes in pulp} = \frac{158.8(x-1)}{x}$$

$$\text{Slimes: Solution} = (x-1) : (1-.37x)$$

All tests to determine gold extraction from pyritic slimes should be made on the moist material, as the process of drying effectually changes the conditions of actual working by oxidizing the reducing substances present.

Alkali determinations, as already remarked, constantly require to be made by shift men in a slimes plant. This is done as follows (according to the method suggested by Mr. J. E. Clennel): Take 100 c.c. of solution to be tested; determine cyanide strength with standard silver nitrate solution (1 c.c. Ag NO solution = .01 per cent KCy); add a drop or two more of Ag NO_3 solution to the test, and a few drops of .5 per cent solution of phenolphtalien as indicator, and titrate with decinormal acid (1 c.c. $\frac{N}{10}$ acid = .004 per cent alkali). The best acid to use, being stable, is $\frac{N}{10}$ H_2SO_4, prepared in the usual way; but, in case the appliances for preparing this are not available, a decinormal oxalic acid solution may be used, as recommended by F. Mohr. A decinormal solution of this, sufficiently accurate for practical purposes, may be prepared, like the standard silver nitrate solution, by dissolving 6.3 grms. pure dry oxalic acid in distilled water, and making up to a litre.

Mr. Crosse—I know the discussion on this paper will be postponed. There is only one important question I would like to ask Mr. Caldecott, because he might be misunderstood. He said the amount of slimes in any solution could be determined by taking the specific gravity.

Mr. Caldecott—With fair accuracy.

Mr. Crosse—I do not see how that can be managed. How do you take the specific gravity?

Mr. Caldecott—I took the specific gravity in the ordinary way, by weighing equal volumes of water and slime pulp. The hydrometer readings are not sufficiently accurate owing to the rapid settling of the slimes.

Chas. Butters—There is a good deal more in Mr. Caldecott's paper than appears on the surface. When you have a contract to treat some hundred thousand tons of slimes, and you cannot dissolve the gold, owing to the want of knowledge, it is a very great relief to find out. At the time these experiments were carried out we were in very great difficulties at the Robinson on account of the gold not dissolving, and Mr. Caldecott deserves a very great deal of thanks from us. There are millions of tons of accumulated slimes on these fields. I was obliged to close down the Crown Reef slimes plant because we could not make it pay, and I think we would be obliged to close down a good many others if this matter had not been worked out.

Believe It Will Advance.

The general impression prevailing among smelter men and others familiar with the lead situation, says the Denver *Republican*, is that lead will advance until it reaches not less than $4.50 per 100, and the reason for this belief is that the demand for several years has been so trifling that stocks were kept as low as possible. Now that there has been an abnormal increase in the demand the market is caught with nothing on hand and not enough production in sight to meet the call, and the probabilities are that under the stimulating influences of construction in all lines the price will go higher.

"I think," said a well-known ore buyer and smelter yesterday, "that in a short time the price will advance to such an extent that a large number of mines that were closed down when the drop in silver first commenced will be opened up and do better than ever. Let lead once reach $4 and the effect will be seen at once. It is a very simple matter to figure it out on any given basis. Take, for instance, ore that runs six ounces silver and 15 per cent lead. The loss in the silver has been 60 cents. The gain in lead between $3.60 and $4 per 100 is $1.20, a net gain of 60 cents on the ore. For that reason I believe that when lead reaches $4 there will be as many low-grade silver-lead mines in operation as there were before the decline."

J. B. Grant shares this view and thinks that lead will go up to $4.50. He says there is no probability of the supply of lead being sufficient to reach the demand. There is a short supply in the country, with all the known resources taken into consideration, and there is not much probability of an increase. He is still of the opinion that silver will not go below 50, and even if it reaches that point the advance in lead will more than offset the loss in silver from ores carrying not less than 15 per cent lead, and running low in silver. With lead at $4.50, even ores running ten ounces in silver and 10 per cent lead will make a net gain of 60 cents per ton, with silver at 50 cents, as against 62 cents on July 1.

Preservation of Mountain Forests.

Written by M. B. CURTIS, Nordhoff, Cal.

The forest primeval is our most valuable inheritance. It is the ready cash of Nature's bountiful provisions for our future; it is a bounty that we, as Americans, are ruthlessly destroying. Already statisticians are figuring out how many years will elapse before we have a timber famine. The shortage of timber for building and fuel are the least of the evils of forest destruction. Iron and steel are taking the place of wooden beams, strawboard and other materials are pressed and rolled into shape to substitute for wood; and, as for fuel, oil, coal and electricity can supply us with heat. As to the value of our forest products, Mr. Fernow places that in round numbers at one billion dollars annually. It ranks third in importance of our industries, manufactures of all kinds and agricultural products of all kinds ranking respectively first and second.

Evils of Forest Destruction.—The great and almost irreparable evils of forest destruction are the influence on climate and the destruction of our watersheds—with the attendant evils, alternate drouth and flood—and increase of cyclones, blizzards and hurricanes, with attendant loss of life and property. It is in this last phase of the evils of forest destruction that we are principally interested, although as citizens of this great Republic we should be interested in all that pertains to the common welfare of our country, for what affects the interests of one part of our country in a measure affects the whole.

A few years ago the mountain region to our north, the Sierra Madre range, was set aside as a forest reservation and to preserve to the people the possible reservoir sites. The preservation of our mountain forests means the preservation of our summer water supply. Each succeeding dry season sees a large area swept by forest fires, the woodman's ax is ringing in the accessible mountain canyons, and man, or, at least, some men, seem to be doing all they can to destroy our heritage. The denuding of our mountain forests means that our winter rainfall, instead of sinking slowly into the ground through beds of decaying vegetation and slowly percolating down the mountain side, to gush from rocky crevices as springs and rills in the hot summer months and swelling the mountain streams, in turn to be conveyed to our orchards, or, flowing underground, supplying our tunnels and wells, and touching with life our thirsty land, will rush, demon-like, down the bare mountain side, swelling the winter torrent, devastating our fields and orchards, and in a comparatively few hours lost in the sea—lost to all good to the rancher in his time of need. To the stranger gazing at our mountain side the question might arise: "Why so much fuss about a little scrubby brush? A season or two will supply it with a new growth." Let our stranger climb the mountain sides, where the mountain fire has not swept, and what looks like new brush from the distance will prove to be a dense growth of scrub oak and chaparral, and underneath a dense covering of decaying leaves and twigs a foot in depth. This acts as a mulch, preventing evaporation, and the growing brush above prevents the fierce rays of the summer sun from shining directly on the soil. The taller trees, swaying in the winds, loosen the soil around their roots and it more readily absorbs moisture. Man attains this loose soil only at a great expense of labor and cultivator teeth.

A Local Instance.—As an illustration in a small way of what the destruction of our mountain cover means, I will cite an instance that came under my own observation within the past year. A mountain fire swept the sides of one of our mountain arroyos bare last July. From this arroyo came the domestic water supply of a foothill rancher. A pipe line conveyed the water to his residence. This pipe has lain undisturbed by flood for more than a dozen years. The first rain of the season swept it out, bending and twisting the pipe, and the second rain doing the same. The pipe was finally moved up the hillside. In the same storm immense quantities of drift were swept down the Wolfskill creek, the mountain torrent dashing 20 feet high. I venture the assertion that the sole cause was not a cloudburst, but was the sweeping away of large areas of forest cover. To-day a large force of men and teams are at work cutting and hauling timber from San Dimas canyon. The work of destruction has been going on all last season and is being pushed with great vigor. The Los Angeles parties who claim the timber—though how they came to be possessed of it no one seems to know—avow it as their purpose to cut every stick of timber in the canyon that can be reached by team. This canyon is one of the prettiest and most accessible to Pomona and the surrounding country, and it will be rendered bare and unattractive. The growth of years seems destined to be ruthlessly swept away unless prompt and energetic action be taken.

What is being done here inside the forestry lines is being done from the sea to the desert, and it is only a question of time till the beauty of our mountain canyons will be lost to us forever. Instead of being places of beauty and attractive resorts for pleasure parties, they will be bare, dry canyons, through which the winter floods will rush in unchecked violence.

The Use of Cyanide.

In a recent report issued under the auspices of the Colorado School of Mines the following reference is made to the uses of cyanide:

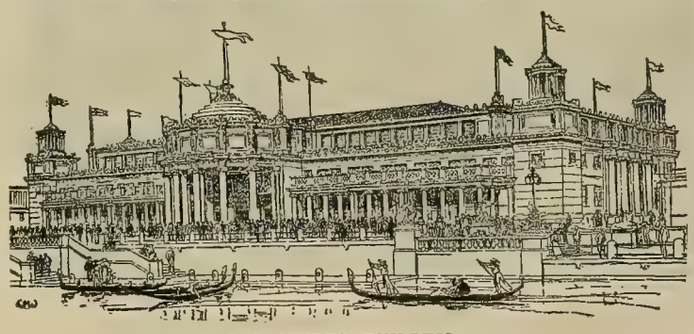
The cyanide process, while generally applicable to oxidized ores containing fine gold, is quite unsuitable to such ores if the gold occurs partly in a coarse state, unless the cyanide is preceded or followed by amalgamation. It may also be broadly stated that copper ores are unsuitable for cyanide treatment, even with dilute solutions. I am aware that the statement has been made that dilute solutions have no effect on copper sulphides. Practical experience, however, does not confirm this statement. Copper invariably passes into solution and accumulates until it becomes of such strength as to be precipitated on the zinc in the boxes.

Two experiments of Mr. Skey of New Zealand in this direction are to the point. Chalcopyrite and copper glance were taken by Mr. Skey, crushed, thoroughly washed and afterward placed in a 0.03 per cent cyanide solution for one hour. The solution being then tested, a perceptible quantity of copper cyanide, traces of sulphur and oxidized sulphur compounds were found in it. Sulphur of antimony is another objectionable mineral often stated to be quite unaffected by cyanide solutions, although as a matter of fact it is quite soluble. It is probable that in the foregoing copper and antimonial minerals part of the sulphur combined with the potassium, forming potassium sulphide that may possibly coat the gold with a sulphide film, which protects it more or less from the solvent action of the cyanide. In this connection an experiment by Skey is suggestive. He found that a 1 per cent solution of pure cyanide dissolved a given weight of gold in ten minutes, but on the addition of 1-100,000 part of sulphur (as a sulphide) to 1 per cent solution of cyanide, it required two hours to dissolve the same weight of gold. While fully admitting the deleterious qualities of alkaline sulphides, I must state that I have not found such minute quantities to be of serious moment in the practical application of the cyanide process. When the sulphur of a soluble mineral combines with the cyanogen it does not interfere with the solution of the gold, and very probably for this reason. Galena, though soluble, is usually quite amenable to cyanide treatment. Zinc blende and pyrites are practically insoluble in cyanide solutions.

In making extraction tests on ores it is important to note that an abnormal consumption of cyanide is invariably associated with a low extraction of precious metals. This consumption may be due to free acid in the ore, acid or basic salts, or ores easily soluble in the solution. The cause should at once be investigated and the evil corrected as far as possible before proceeding with the test. Cyanide of potassium, though a most active chemical, is easily broken up by acids, base metals and organic matter, forming numerous perplexing compounds while in contact with the ore changes and in passing through the precipitation boxes. It is doubtful if the complete chemistry of these changes is fully understood even by those who have made it a careful study.

Transmississippi and International Exposition, Omaha, June to November, 1898.

The principal feature of the lagoon facade is a circular dome 150 feet in circumference, rising to a height of 75 feet. The four corners of the building are marked by square plain towers surmounted by



MANUFACTURES BUILDING.

ornate, open, columned pavilions, circular in form and to serve for electric lighting. The Manufactures building is 300 feet long and 140 feet wide.

Unusual Surgical Operation.

A remarkable surgical operation has been performed upon Adrian Dehertoghe, a machinist of San Francisco. Fifteen yards of silver wire, as large around as an ordinary hypodermic needle, have been introduced into and coiled within his aorta, the arterial channel leading directly from the heart. Those 45 feet of wire have been in there for three months and, surgeons say, have saved his life. They were inserted at a time when death seemed certain—complications resulting from a severely injured aorta, the patient's trouble being an aneurism, or saculated tumor of the arterial wall. Its development to a rupture of the aorta was only a question of time, with instant death as the result. The wire was introduced into the distended or abnormal sac formed in the aorta, in order partly to fill it and form there a clot, that would in time contract and be there absorbed, thereby restoring the channel to its normal formation.

The Co-operative Plan.

An illustration of the advantages of co-operative mining is the success which has attended operations at the Unity mine, near Nevada City. The mine was partially developed under the old company and a small plant was secured, consisting of hoisting and pumping rig and a 5-stamp mill. The company did not make their operations pay, and after sinking to a depth of 300 feet work was stopped and the Gold Flat Company failed. The mine afterward came into the possession of Weissbein Bros., of Grass Valley. Nine practical miners took a three-years' lease of the mine, with the privilege to purchase for $15,000. The lease provides that a certain proportion of the receipts from the mine shall be paid to the owners, when the rock yields more than $8 per ton. The percentage is to apply upon the purchase price.

They found the mine full of water, the batteries in poor condition and the need of repairs everywhere. They set to work with a will about the 1st of June, soon had the water pumped out of the mine, sank an air-shaft 116 feet and ran a 40-foot drift to improve the ventilation of the mine. They began at once to take out ore. By gradually improving their mill, and experimenting as to proper speed for the stamps, they obtained from the ore double the results previously obtained. Their last cleanup showed the rate of $12 per ton. They crush six tons per day with the 5-stamp mill. Fifty-two ounces of amalgam were cleaned up in three days' run. The ledge from which the ore is taken is well defined and permanent in character, about 14 inches in width. There are three good ore shoots. These miners are planning to sink another 100 feet in the shaft, and will then run drifts to strike the same shoots. There is every reason to believe that the percentage which they are to pay under the lease will buy the mine long before the expiration of the term for which it is made.

We congratulate these plucky miners upon their success in this venture. It shows what practical men can do with property of any promise whatever. We believe there are numerous other mines in Nevada county which could be developed in a similar manner, provided miners with grit can be brought into contact with mine owners who will make reasonable conditions. Let the Unity be an example for other co-operative associations to follow.—Grass Valley, Cal., Tidings.

Several Others.

A local paper at Kaslo, B. C., says: "The Payne ore chute is believed to be the longest continuous ore chute in the world. One tunnel is now 756 feet in ore the entire distance, and the end not yet reached. In places the ore body is 4 feet wide." In the vein of the Smuggler-Union mine, San Miguel county, Colorado, a length of one mile has been worked along on various levels. There is one stope in that mine 800 feet in length where, in raising it, not a single point was found where the ore narrowed or grew so poor that it was left standing, while the limits of the ore chute is not yet reached. There are others.—MINING AND SCIENTIFIC PRESS.

Yes, "there are others" right here in the San Juan. The Silver Lake has leads that have ore chutes 1000 feet in length, 9 feet in width and a known depth of 800 feet. The Iowa Company, in the same basin, have ore chutes nearly as large in width and just as much in length and richness. The Virginius has an ore chute developed over 3000 feet in depth and about 1100 feet in length.—Silverton, Colo., Standard.

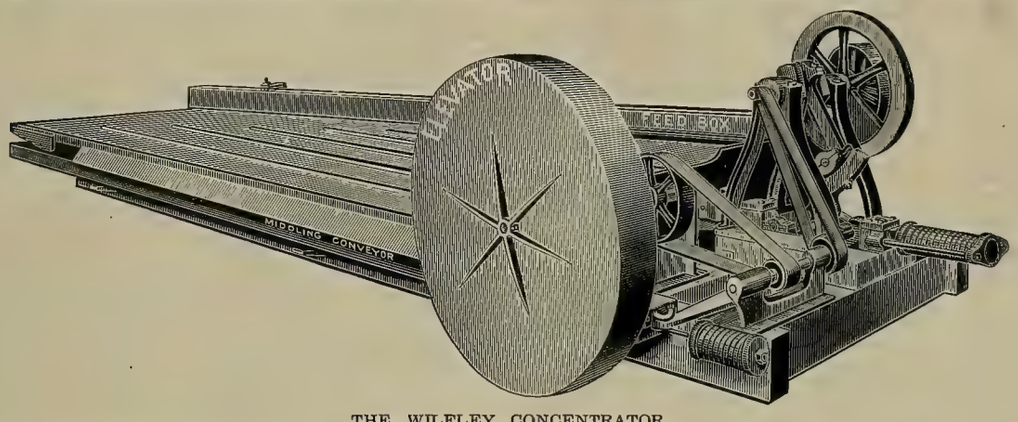
New Sulphur Mines.

The Mexican Sulphur Company have begun the extensive development of their property near the Hardy Colorado river in Lower California. J. A. Dubbs is general manager. A railroad is to be built from the mine to the river seven miles. A thousand tons of sulphur ore is now on the dump, the result of prospecting for some weeks. Manager Dubbs says the ore assays 80 per cent pure sulphur. It will be shipped in a crude state: that destined for the Pacific coast on river barges to Yuma; eastern shipments will be made on vessels loaded from barges at the head of the Gulf of California. The method of mining the ore is simple. Wagons are driven in the deep vertical cuts, the walls of which are of sulphur, and the ore is simply broken down and loaded in the wagons below by means of chutes. Very little time is required to load a two-ton wagon and another immediately takes its place. The ore is combustible and a piece of it burns readily if lighted.

Mechanical Progress.

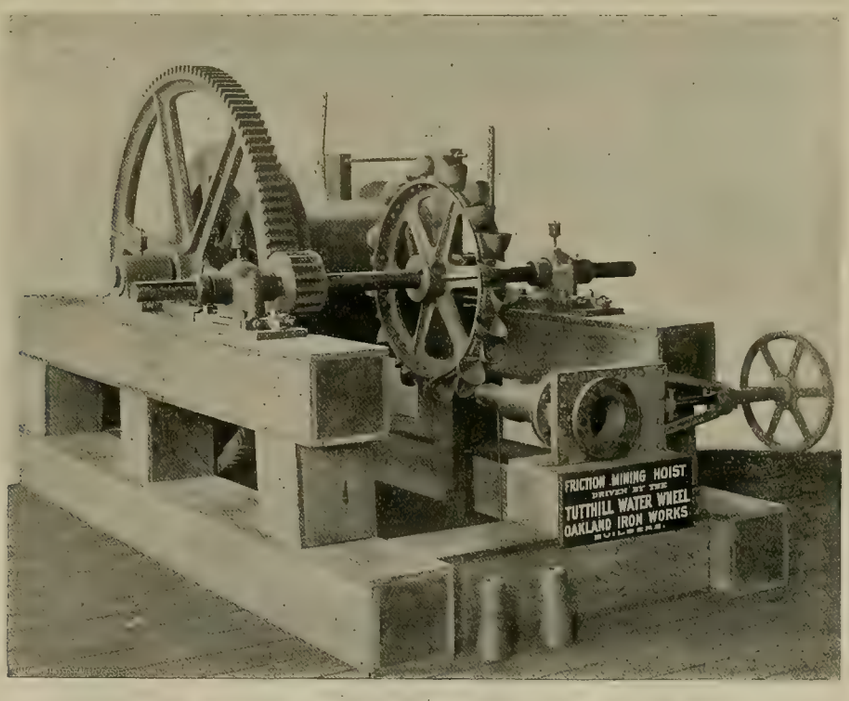
The Wilfley Concentrator.

The concentrator consists of a flat table, 7x16 feet, resting on rollers, and is operated by an eccentric, giving a jerking motion, which carries heavy material to bottom of bed, then forward to head end of table. The pulp is fed through a feed box extending from end to end. This box is divided in such a way as to feed pulp at one end and clean water at end where concentrates pass off. All the material is kept continually under water and not exposed to the air. The silica passes across the table, it being slightly inclined, and off at the side, it passing over cleats, coarse silica passing off first, the table acting as a sizer to a certain extent. The table is covered with linoleum, on which is nailed from two to seven cleats about ½-inch high at tail end of table and tapering to a feather edge toward head end. The first cleat is put on lower edge of table and runs up to within 2 feet of head end; the other cleats are shorter and shorter as they cross the table toward feed box, making the last cleat about 4 feet long. The pulp is fed onto table as near tail end as possible and the jerking motion sends concentrates to bottom, and at the same time moves them toward head end. When concentration commences, the coarse silica passes over high end of cleats, and, as ore moves forward, finer silica rises as height of cleat decreases and passes off. This, the manufacturers say, is done without materially disturbing bed of concentrates, which moves forward and around end of cleats until a sufficient quantity collects to go straight forward and off head end. The space left between end of first strip and head of table allows middlings to pass into a long trough on side and pass to wheel conveyor at extreme tail end, where it is elevated and passed over table into feed box to be retreated. The adjustment is done by turning a hand wheel connected with a rod running entire length. This rod operates wedges, which raise on lower side of table evenly from end to end. The capacity is from fifteen to twenty-five tons per day of twenty-four hours per table, and the agents, Messrs. White & Rogers, 306 Pine St., San Francisco, say with this load it will take the finest kind of material forward.



THE WILFLEY CONCENTRATOR.

THE accompanying cut illustrates a single drum-geared hoist designed to be operated by a Tutthill water wheel at the Hedrick gravel mine, Calaveras county, Cal. The hoist is of the V friction type—simple in design and strongly constructed. The brake, as will be observed, is of the post type and will be operated by a foot lever from the working platform. The friction and gate will also be operated by hand lever from the same platform, thus, the manufacturers claim, insuring instant and positive control when the hoist is in operation. The bearings are mounted on sole plates, which are provided with adjusting screws so that the gear and pinion can be held in proper mesh at all times. The Tutthill wheel shown in the cut in connection with the hoist is designed to develop 30 H. P. under a head of 150 feet, and can be furnished and connected with these hoists suitable to any requirements or heads. The hoists and water wheels are manufactured by the Oakland Iron Works, Second and Jefferson streets, Oakland, Cal., and their San Francisco office is at No. 108 First street. The shipping weight of this hoist and wheel, knocked down and boxed, without wooden frame, is 4900 pounds.



FRICTION MINING HOIST DRIVEN BY TUTTHILL WATER WHEEL.

Scientific Progress.

Water Power Possibilities.

Far-seeing men all over the world are looking for substitutes for the coal which, as the source of steam power and as a necessity in various metallurgical operations, lies at the basis of nearly all manufacturing enterprises. Coal is getting dearer everywhere, even in regions where, as in the greater part of the United States, no scarcity has yet been developed. With the rapid increase of consumption which follows an increase of population, the day can not be far off when scarcity will be felt even in what are now the most favored regions. The yoking of the winds or the sun's rays was to the chariot of industry occupies the thoughts of not a few. Ericsson taught us, before he died, that a caloric engine set in motion by the sun's rays was not an impossibility, and in the direction of power generated by thermo electricity—the sun furnishing the heat—still more definite successes seem to lie. But it is in the greater development of natural water power that the most practical men look for the readiest substitute for steam. Lord Kelvin, the eminent British scientist, said recently in a public address that he looked for such scientific and successful use of water power that the industrial conditions of all Scotland would thereby be transformed. All classes and all parts of the country, he thought, would be profoundly affected. The localities where the "scientific and successful" development of water power can be achieved at the smallest expense are those which will take the lead now held by localities most accessible to coal deposits. Such water-favored localities, where natural power has been used in a wasteful way by old-fashioned methods, are studying how best to get the full value from the natural endowments of their sites by the use of more scientific methods. California is occupying prominent place in utilizing the unyoked water power of mountain and valley, in producing electric power and light and thus creating a new industrial era.

Andree's North Pole Balloon Voyage.

In Andree's balloon the total buoyancy of the gas was 12,000 pounds. The three men would weigh 500 and the balloon probably not over 1700 pounds. Very tight balloons have been made in this country that would weigh for the same size about 900 pounds. This would give eighty days' flotation. It is probable that the computation calls for even a heavier balloon, and also for carrying the car all the way. It is customary, however, to prepare the car so that it can be used as ballast and at the last use the ring of the balloon. It is a pity that more experience was not gained in a long voyage before attempting the extremely hazardous voyage to the Pole. The fact that the balloon was beyond control at the very start is very significant. It is doubtful if any aeronaut living can release safely a balloon of 170,000 cubic feet capacity in a twenty-five-mile wind. If plans had been made to keep the balloon at 6000 feet or so the success of the voyage would have been better assured. By using a small pilot balloon it would have been easy to send the overflow into the smaller balloon, and, after the larger had leaked out enough, the gas in the smaller balloon could have been sent into the larger and the smaller used as ballast. At 6000 feet the danger of rain and sleet freezing on the balloon would have been avoided and the currents which are far steadier and more rapid would have reduced the voyage by one-half or even one-third. It is not generally known that this country holds the record for a long-distance voyage.

On July 1, 1859, La Mountain and three others sailed from St. Louis, Mo., to Henderson, N. Y., 870 miles, in nineteen hours. Such constancy and velocity of air currents is seldom thought of and could have been found only, as in this case, at a height of 6000 to 8000 feet.

The balloon route would seem the ideal method of reaching the Pole, and the French are already planning for such a voyage in 1898. Let them first bring their balloon to this country and make the Atlantic voyage in the track of the steamers, where the least untoward event will not be absolutely fatal. Also, let the balloon be placed at a height of at least 6000 feet. It is just as easy to keep a ballon there as close to the earth. At Mt. Washington (6300 feet) there have been frequent cases of west winds of 100 miles and over per hour for thirty-six hours, and this would mean less than forty hours for the trip.

Of course, the great question is as to the occurrence of storm and high-area conditions at the Pole similar to those in more southerly latitudes, and the evidence from weather maps made near the Pole seems to show a great similarity. If so, any steady wind near the Pole would give a straight course to the Pole, and the same wind would give a straight course back to civilization. It is a pity that with so much interest centered in this enterprise there should be so many fakes of carrier pigeons, etc., started. It is very rare, indeed, that a carrier has been known to fly 1000 miles, and then only after being taken over some part

of the course half a dozen times. For a carrier to go 1500 or 2000 miles is an unheard-of feat.

Only One World.

Scientific contemporaries have come to the conclusion that there is only one earth, and such being the case, it is a very desirable place of residence. An idea prevails in the common mind that our world is only one of countless similar bodies; that space is filled with solar systems not unlike our own, and that it is possible other globes are inhabited and quite as habitable, if not more so, than the one on which we dwell. *Popular Astronomy* says: "Although our solar system is only one among thousands of systems now known to exist in every part of the heavens, among all these other systems there is not yet a single one which closely resembles our own."

This is not a positive assertion that ours is the only world in which human beings live and move and have their being, but it leads up to that belief, and this is sustained by much argument dealing with astronomical technicalities which may be omitted here.

Not only is our earth unique in its favorable position in our system, but our system as far as is known is unique in the universe of systems. We rarely think on how narrow a margin we live. A little more heat or a little more cold, and we die. Our existence depends on keeping changes of temperature within a range of about 1 per cent of what we know as possible extremes. If the moon were very much larger the tidal wave would carry the entire ocean twice a day over the surface of the earth. If the earth were much smaller we would lose our atmosphere; if it were much larger we could not stand upright more than five minutes, nor would we be able to mount a hill except by painful crawling. If the year were twice as long as it is, it is doubtful if we could raise food enough in the summer to carry us through the winter, or if we could survive the accumulated cold. In every way our earth lies just at the meeting point of two kinds of death which "on this bank and shoal of time" we must fight with either hand. It makes no difference whether we have fitted ourselves to the earth through a long process of evolution, or whether it was fitted to us; as far as we know, it is the only habitable spot in the universe, and the chances are almost infinite that no other is so favorably located. Let us make the most we can of it.

THE primary cause of the low barometric pressure which marks the storm center and establishes the cyclone is expansion of the air through excess of temperature. The heated air, rising into cold upper regions, has a portion of its vapor condensed into clouds, and a new dynamic factor is added, for each particle of vapor, in condensing, gives up its modicum of latent heat. Each pound of vapor thus liberates, according to Professor Tyndall's estimate, enough heat to melt five pounds of cast iron, so the amount given out where large masses of cloud are forming must must enormously add to the convexion currents of the air, and hence to the storm-developing power of the forming cyclone. It is doubted whether a storm could attain, much less continue, the terrific force of that most dreaded of winds of temperate zones, the tornado, without the aid of those great masses of condensing vapor which always accompany it in the form of stormclouds.

A MIXTURE of 90 per cent of lime, 5 of resin and 5 of calcium carbide is claimed by an Italian, H. de Fazi, to be better and more economical than calcium carbide for producing gas. No special burner is required, and there is no fear of explosion from mixture with air.

FRENCH peasants have a belief that if a fire with much smoke is made in the stove on the approach of a storm, safety from lightning will be assured. Schuster shows that the custom is based on reason, as the smoke serves as a very good conductor for carrying away the electricity slowly and safely. In 1000 cases of damage by lightning 6.3 churches and 8.5 mills have been struck, but the number of factory chimneys was only 0.3.

Advances of Modern Science.

There are some, says W. T. Stead, who imagine that this age has been destructive of the belief in miracles. In reality it, more than any other since the world began, has brought home to the average man the stupendous miracle of the world. They call it a materialistic age, which has chained the soul of man to inert matter. But almost before the reproach is heard, science proclaims that there is no such thing as inert matter, that every atom is alive, and that our mortal bodies are vast composite conglomerations of living organisms, upon whose pitched battles in our veins depend our health or our disease. To take but one instance: Imagine all that we understand by the word microbe, and then recall the fact that the microbe was practically unknown sixty years ago. In a very special fashion, science has revealed to us a new heaven and a new earth, infinitely marvelous, testifying to an understanding so vast that the mind of man cannot by searching find it out. Behind each discovery that advances our knowledge, the infinite unknown indefinitely recedes. We weigh the stars, analyze their composition in the spectroscope; we photograph the moon and make maps of the canals in Mars. But far more stupendous are the discoveries that have been made, not in the infinitely distant abysses of space, but in the infinitesimally small molecules which are all around. Science has sent its Roentgen ray through the darkened veil and revealed the invisible and summoned all men to enjoy it as their inheritance.

THE Treasury Department will send out a special agent to make an investigation of the value and market price of calcium carbide, used in the manufacture of acetylene gas.

Electrical Progress.

Bursting of a Bubble.

The New York scheme in which were interested John Jacob Astor and Dr. W. Seward Webb has apparently collapsed. Incidentally, a system of electrical propulsion which it was thought would revolutionize marine engineering has failed to prove successful. The enterprise was the Samuels Dynamic Accumulator Company. The company manufactured a storage battery cell invented by Zak Williams. This cell was expected to solve the problem of electrical transmission both on sea and land, because it was thought that it could do twice the work of any other battery while weighing and costing only one-fourth as much. The first test of the battery was made on Mr. Astor's small yacht Progress. Sixty-eight of the cells, weighing only thirty-two pounds each, including the case, were put in. The expert's report of the efficiency of the system was so glowing that Mr. Astor at once began building a big 72-foot yacht to be equipped with the batteries and gave it a suggestive name—Utopian. Dr. Webb had buffet car No. 66 on the Chicago Limited equipped with sixty cells to supply incandescent lights for the round trip and arranged to have his car Elsmore and his locomotive Nehasene lighted by the same system. Dr. Webb hoped to build an electrical storage locomotive to haul a train to Buffalo and back without recharging the battery. The factory went ahead at its full capacity, turning out the 400 cells needed for the Utopian and the several hundred more to be used by Webb. Then came the experiments. They were not successful. The system did not prove effective on a large scale. The Utopian soon went out of commission and the batteries were not installed in Dr. Webb's private car, because they had not worked well in the buffet car. The result is that Dr. Webb and Mr. Astor have withdrawn from the company.

Firing Dynamite by Electricity.

At the Verbelia, Colorado, tunnel the dynamo used is located in the gulch 25 feet from the mouth of the tunnel; wires are run into the tunnel connecting with the electric caps, which, when the current is turned on, explodes the dynamite. This electric cap, in construction, resembles an incandescent lamp, inasmuch as it has two wires leading into it with a filament of platinum, but it differs from the incandescent lamp filament in action; the filament in the lamp is strong enough to carry the current which makes it incandescent, and therefore gives out a steady light, but the filament in the cap is not strong enough to carry the current, but burns off, causing an electric spark to ignite the fulminating powder in the bottom of the cap and explode, thus exploding the dynamite. The wire and filament in the cap are held in place by sulphur, which is poured in while it is hot, thus making the cap waterproof. The dynamo, which connects by wires with a round of holes in the tunnel, has a pull-up or push-down handle, which is connected to the armature by means of cog wheels which causes it to revolve at a high rate of speed, thus generating a large quantity of current, which is held in the dynamo by means of a short circuit until the armature has gained its highest speed, when the short circuit is automatically broken, allowing the current to flow through the caps and causing them to explode.

This is a safe way of exploding dynamite, because the miner must get out of his shaft or tunnel before the current can be turned on, and, consequently, there is no danger of any of the shots going off prematurely or of any of them hanging fire; and, to be doubly safe, the miner can keep his dynamo locked and the key in his pocket.

The English of It.

(*From the London Electrical Review.*)

LUDLOW, September 1.—The Corporation of Ludlow offers a prize of £20 to the best and most economical scheme of electric lighting for the borough. Town Clerk, Mr. John Herbert Williams. Should the Corporation employ the engineer whose scheme is awarded the prize to carry the work out, then the £20 will merge in commission.

That is to say, the Corporation of Ludlow wants all electrical engineers to draw up specifications for lighting the borough and promises to contribute $100 to some one of the lot—the Corporation, however, to have the benefit of all. And then, says *Electricity*, should the successful competitor also be chosen to carry out his plans, he will be permitted to relieve the Corporation of the necessity of paying him the $100 by taking it out of his commissions.

AS IN California, so elsewhere in this west half of America, great electrical plans are fast being put in tangible shape. A site has recently been selected for the proposed dam on the Big Hole river, Montana, at which point will be erected a $500,000 electrical generating plant to transmit current to Butte, Montana. It is expected that the plant will be completed by February, 1898. The power house will be 212 feet long, with a steel smokestack 150 feet in height. The dam on the Big Hole river, four miles from the divide, will be 60 feet high, built of masonry. The penstocks will be 10 feet in diameter. It is expected to transmit 5000-horse power to Butte, at an approximate loss of 10 per cent in transmission.

NOTHING more forcibly illustrates the resources, skill and inventive power of our people than the development of electrical industries. It is estimated that the capital invested in all of the various industries reaches $1,200,000,000. Inventions are almost in sight which will require vast quantities of money to develop. The practical application of electricity in the house and factory will be pushed to an extent now thought impossible. The rapidity with which improvements come absorbs and eats up great quantities of time, money and materials. A newer and better piece of electrical mechanism takes hold at once, the old going into the scrap heap.

F. SMITHSON has a model of the Meyer apparatus for immediately stopping the machinery from any part of the establishment by the simple pressure of an electric button. This device is in successful use in some large works and consists of a throttling valve applied to the main steam pipe, near the boiler. By a simple mechanism the valve can be instantly closed by an electro magnet, operated by a current of 10 to 12 volts. At the works where the experiment is in progress a Corliss engine, running eighty to ninety revolutions and delivering steam through a 3-inch pipe, is stopped by the device in a very few seconds. At the instant of making the electrical connection a whistle is automatically blown to attract the attention of the engineer in charge. In the larger works in France, in addition to the valve, there is an automatic brake which is set in action simultaneously and applied to the fly wheel. The possibility of stopping machinery from any part of an establishment by simply pushing an electric button will save many lives and much damage to property.

A NOVEL gang plank is being employed by the International Steamship Company at its wharf at Eastport, Me. Owing to a variation of 26 feet in the tide level and the fact that loading is accomplished by trucks, considerable trouble has always in the past been experienced in loading and unloading, and at times several men would be required to push the trucks up the steep gang plank. The present arrangement, as constructed by the Belknap Motor Company of Portland, Me., is in brief a reversed treadmill operated by an electric motor through suitable gearing. The gang plank is a frame supporting a moving floor 60 feet long and 4 feet wide, upon which the stevedores simply run their loaded trucks and stand until they are carried to the top of the incline. It is found that the conveyor is in every way a success and effects a great saving in time and money.

ONE evening last week at the Mechanics' Fair Pavilion, in this city, a band playing at Coronado Beach, 600 miles south on the California coast, was distinctly heard by long-distance telephone, and an operatic selection by the band in the Pavilion was as distinctly heard at Coronado. The long-distance telephone line connecting San Diego with Los Angeles and San Francisco is in operation. San Diego can now talk with Redding, Cal., direct over 904 miles of wire—one of the longest circuits in the United States.

THERE are now three completed electric railways in Japan, and work on four other roads has begun—one an electric railway, fifty miles long, through a number of small towns in the vicinity of Kobe. Current for the line will be generated by water power.

H. C. FAIRBANKS of Sibley College, while reconstructing a gas engine, observed a singular though probably not exceptional phenomenon which, so far as known, has not been previously described. The machine exhibited a great loss of heater efficiency, which was unaccounted for and was not affected by any changes made in the process of repair. Finally it was suspected that the conductivity of the metal of the cast iron "fire pot" had been impaired by oxidation or otherwise, and it was replaced by a new one. The engine at once started off at full power and regained its origininal efficiency.

THE Australasian Chamber of Mines in London are making arrangements for an international mining machinery and metallurgical exhibition to be held in London in 1899, in time for the exhibits to be forwarded to the Paris Exposition in 1900.

Mining Summary.

CALIFORNIA.

Amador.

At the Black Prince mine, Mount Echo district, four miles from Ione, E. N. Alexander foreman, the shaft is being deepened 50 feet.

Republican: The Oneida shaft is down over 1200 feet. Everything is running along smoothly. This is about the quickest work in shaft sinking that has been witnessed in Amador county, especially considering the excellent character of the work. It is the intention to go down at least 500 feet deeper before exploring for the ore body.

The South Eureka is reported to be paying, ore yielding a liberal margin over expenses.

Butte.

Mercury: About fifteen tons of mining machinery is at the depot, consigned to the Oregon Gold Mining Company, J. Champion superintendent, at Enterprise. A big stamp mill, steel bars, sheeting, etc., make up the lot.

Calaveras.

The Rising Star gravel mine, recently in operation under the management of J. L. Gleeson and subsequently closed down, has been bonded to San Jose men, who will resume operations.

El Dorado.

The new mill and twenty stamps at the Buena Vista mine are being constructed.

The Starlight mine, El Dorado, has shipped a carload of sulphurets to San Francisco.

The "800 nugget" found at the Shaw mine was worth $457.

New buildings and machinery are being put up at the Pocahontas mine.

The *Republican* says a move is being made to interest capitalists in the slate quarries on the American river, and adds: "It cannot be said that these mines have been tested till they are worked by good business managers with a clear working capital of $100,000 to start with. Nobody has yet tried them under conditions that would bring success in any quarries."

The *Nugget* says the company who have had the Griffith Consolidated mine near Diamond Springs bonded have paid for the property and are preparing to thoroughly develop it. Heavier machinery will be put in and the mine will be worked full-handed.

Fresno.

The Minaret mineral area, on the headwaters of the San Joaquin river, is about eight miles square; on the west and northwest sides are large deposits of high grade iron ore. On the east branch of King's creek are the Lake Superior gold, copper and silver mines, assaying high in silver and gold. One of the many advantages for mining in this district, says an *Expositor* correspondent, is the cheap water power there. On the headwaters of Minaret creek and Kings creek are sixteen large lakes, and the water capacity of any of these lakes can be increased by a small dam at the outlet. These creeks carry a large quantity of water, with many waterfalls from 25 to 1000 feet. For instance, on Kink's creek, at the lower end of the Comstock vein, the whole body of the entire stream within half a mile falls over 200 feet, and the same can be said of the Minaret creek and the three branches of King's creek, above the Comstock.

The Mammoth mines now get their heavy castings and machinery from Chicago and Columbus, Ohio. It comes by railroad to Bishop creek and Benton, and then by wagon to the Mammoth mines.

Inyo.

Considerable life is reported from Ballarat, where several prospectors have good finds. Montgomery Bros. are operating their mill.

Kern.

At Randsburg the Wedge Company is down nearly 400 feet. Assays of the ore run $50 to $107. There is a favorable change in the character of the ore, now running in sulphurets, indicating a permanency of the ore bodies.

At the Durnal quartz mine, situated between Angua Caliente and Piute, improvements are in contemplation. An 8-stamp mill is to be erected at the mouth of the tunnel and an additional mill is talked of farther down the ravine. The *Californian* says the number of men prospecting for quartz and gravel mines in that vicinity is greater than any previous year since the pioneer days.

J. Waugaman, on Greenhorn mountains, in a recent clean-up, says he got $6480 for a run of six days in a 5-stamp mill.

At Colorado camp, five miles from Garlock, the Cavil Gold Mining & Milling Company, incorporated under the laws of Arizona, has seven claims to be developed.

The Randsburg Placer Mining Company has incorporated with a capital stock of $1,000,000, of the par value of $1 per share. The incorporators are: J. M. Bracewell, J. P. Carroll, D. C. Kuffel, S. H. Reynolds and W. H. Hevren. The company will operate a group of eighteen placer claims two miles southwest of Randsburg.

Marin.

(Special Correspondence).—Marin county is so associated in men's minds with the idea of dairy pastures, milk, butter and cheese that most people will be surprised to hear of its claims to the production of minerals also. The surprise will not be of long duration, however, since in a few years it will stand without a peer as the great copper county of the State.

If anyone be inclined to doubt this assertion, let him take a horse and buggy, cross the "divide" and see for himself. Vast copper fields extend up the Pacific coast north of the bay of San Francisco, and the principal developed property in the belt may be reached by a drive of twenty miles from San Rafael. It is wonderful what a little enterprise will do towards advertising or showing up the resources of an entire section. Scarcely eighteen months ago the fact that there were precious minerals in the Coast Range at all would have been laughed at by old-timers. Now it is another tune. A few energetic men about that time, knowing "what was what," bonded some of the ranches on the coast and proceeded quietly to develop the same for copper. Their success has been phenomenal. They have opened in one place five immense parallel veins, running from 50 to 100 feet in width and carrying from 2 to 20 per cent of copper and small quantities of silver and gold. They are sinking on one particular vein, and from this they expect to reach the others by crosscuts underground. They have already some 200,000 tons in sight, and in a year they can have five times the quantity. This is little, however, compared to the prospects ahead of them. All these developments are confined to a few acres in one locality, whilst the whole property is five miles long and two wide, and copper prospects are found from one end to the other of it.

The company is putting up buildings and a concentrating plant, and will be shipping sulphides, in all probability, early the coming year. Some of the ore is rich enough to ship now without further treatment, and large quantities of this kind are expected when they strike one of the parallel veins for which they are running. The history of this property resembles that of the bean in the fairy story, which grew from the earth to the skies in a single night, for where there were only a few sheep walks or cow sheds less than two years ago are now to be found all the paraphernalia of a complete Sierra Nevada mining camp; and it all seems about as incongruous to San Francisco as the discovery of such an anomaly at Sandy Hook or Cape May would be to New York. This property, however, is only an avant courier. Now that the ice has been broken other investigations have been going on, and copper has been discovered all along the coast in quantities to distinguish this as one of the great copper localities of the world. With good harbors everywhere and boundless forests to draw on for mining timbers and charcoal, it needs no seer to predict the commercial blessings in store for Marin county and the San Francisco bay regions generally as soon as our financiers wake up to the presence of these deposits, and proceed with their usual enterprise to work them.

TAMALPAIS.

Mariposa.

Boston officials of the Merced G. M. Co. say rich rock has been found on the sixth level of the Mary Harrison, the lowest level opened in that mine.

Modoc.

A permanent mining camp will be established at Pueblo mountain, sixty miles east of Surprise valley. The Denio mine is now running a 5-stamp mill, yielding $1700 per month.

Mono.

During August the receipts of the Standard Consolidated were $34,700, disbursements $21,600, net profits $13,100.

Nevada.

(Special Correspondence).—On the Slate Ledge mine, five miles west of Grass Valley, Mrs. Perrin and sons are taking out good ore. They have a tunnel 800 feet in the hill, from which a winze is operated several hundred feet in depth. The east drift is 900 feet on a 4-foot ledge. The west drift is 200 feet. The ore averages $12. The sulphurets run 6 per cent and average $50 per ton. There is a 10-stamp mill in operation.

The new air compressor, power drills and dynamo placed last week in the Orleans mine are doing rapid work, and the Orleans will soon be among the dividend-paying properties of the district. It adjoins the faithful old Empire, which, with its forty stamps, is (since 1857) one of the financial props of this district. The Orleans is owned by only a few people, Mrs. Mills of Mills' Seminary being one of the principal holders of the stock.

At the Crown Point last week, on the 600 level, a 4-foot ledge was opened. After long years and great perseverance, the company (a French syndicate) are finally meeting with success.

At the Independence Messrs. Chevaune and Fricot are doing extensive and expensive development work. They spare no cost in doing their work thoroughly. They are sinking for the Maryland chute. Their present depth is 900 feet; it is expected to find the chute at 1100. The footwall is serpentine. The formation is the same as the Maryland. Mr. H. L. Body has charge of the work.

At the Brunswick Consolidated the east drift on the 900 is in 229 feet; the west is in 300 feet; both drifts are on the ledge, which averages 20 inches. They are placing two plunger pumps and other machinery, expecting to run twenty stamps in the near future. At present ten are in operation. C. H. Mallon is the superintendent.

Grass Valley, Sept. 15, '96.

The *Herald* says the "intermediate ledge" in the Providence mine, on the 1300 level, is 2½ feet thick.

Union: Work will be done this fall on the Old Men's mine at Dutch Harbor, on the Middle Yuba. The company own 2000 feet of the river bed and will let a contract to sink an incline under the bedrock. The claim is owned by Lademan, Bates, Liebrich, Tautphaus, Eastin and Walrath.

Union: Work on the Texas mine in Willow valley will be soon begun. A drain tunnel will be run 180 feet from the face, an upraise started which will practically give a three compartment vertical shaft 80 feet deep when finished. Hoisting works will be erected. Two plants, one for water and one for steam power, are to be built. A pipe line 3000 feet long will be run from the Snow Mountain ditch. There are eighteen different ledges on the property, ranging in width from 15 inches to 10 feet.

Placer.

Six miles northeast of Lincoln the Curtin Mining and Milling Company of San Francisco has the Old Valley mine, T. G. Durning general manager. This mine has a 30-foot vein of pyrites—50 per cent sulphur—a 6-foot quartz vein, a 9-foot vein of iron ore and a 9-foot vein of copper. The company expects to begin shipping pyrites in thirty days, and will commence milling their gold ore in sixty days.

In the Eureka Con. drift gravel mine at the head of the upraise the slate is becoming softer and very wet. Mr. Chappellet is so sanguine of reaching the gold-bearing gravel soon that he has let the contract for building the washing dump near the mouth of the tunnel and will be ready to go to washing the gravel as soon as the channel is struck.

Following is a statement of the Pioneer Mining Company for June, July and August:

	August.	*July.*	*June.*
Tons rock crushed	765	807	650
Value of gold bars.	$14,543	$13,241	$14 156
Pay roll	4,367	3,614	.....
Bills	1,723	2,968	.....
Total expenses	6,090	6,582	5,100
Net earnings	8,453	6,659	9,056
Average value rock	19.01	17.65	21.77

The mine now employs fifty-three men.

Plumas.

The Plumas *Independent* says: "Operations in the Robinson mine have been for the past few weeks suspended, but the cause of suspension having been removed, operations are to be resumed, which will set thirty men at work.

Independent: The twenty stamps in the Little Jamison mill, ten of which have been recently added, are crushing ore day and night. Forty men are employed in the mine and mill.

Riverside.

A ledge which is said to assay $2000 to the ton has been discovered by Superintendent J. M. Sigafus in the Good Hope mine, eight miles from Perris. The Good Hope has employed as high as one hundred and twenty-five men. Now thirty are at work.

San Bernardino.

Placer gold mining is being successfully prosecuted on Lytle creek and prospects are good for repeating the rich strikes of twenty years ago. Platt & Crawford are putting in hydraulic machinery. An $86 nugget was recently found in the canyon.

The application of the Pacific Borax Works for permission to cross a county bridge at Daggett with a narrow-gauge road to the Board of Supervisors has called the attention of the management of the Santa Fe to the plans of the company. A conference was held last week looking to a change of route, and instead of building from the works to Daggett, a distance of fifteen miles, to bring down the borax and avoid the heavy freighting for shipment, it is now proposed to build from the works to Newberry.

Shasta.

The force of the Mountain Copper Company, Ltd., has been increased. The sample rotary roasters are a success and more will be added. These roasters are of particular advantage in handling the crushed ore that could not be made to burn in the ordinary roasters or surface kilns because of the tendency to smother. A new locomotive, recently received, will be used for hauling ores.

The Altoona mine, at Cinnabar, is still flooded and it is estimated that it still contains 200 feet of water. After the big pump is erected it will require ten days' work to drain the mine.

Searchlight: The Mountain Copper Company, Limited, is erecting a residence for Mr. Bennie, shortly expected from the Rio Tinto mine in Spain, to be chemist for the company. Mr. Neilson, who combines this position with that of superintendent of the roasters, will devote his whole attention to the roasters. About three acres of land has been cleared for additional roasting surface, which will largely increase the daily tonnage of calcined ore. All indications point to a material increase in the capacity of mine and smelter.

Sierra.

The Downieville *Messenger* says affairs at the Gold Valley mine have been satisfactorily settled, and the workmen received their wages in full. The mine and works are now running with a good force of men.

Siskiyou.

Journal: The Scheld brothers have put in pipe from the shaft at Yreka creek, on Steele's place, to their boxes coming from Greenhorn, and started their pump, capacity 850,000 gallons in twenty-four hours.

The showing in the Schroeder mine at Deadwood has encouraged those who are thinking of taking hold of the Spencer mine, on the other side of the mountain.

A large number of placer locations in the South Fork of Scott river district have been located lately.

The most excellent results have been realized this season nearly at all the river mines on the Klamath, the majority of which are operated by Chinamen. They have had a long season to work in, and are now experiencing their first trouble with low water, which renders it hard to keep their wheels in motion.

The dredger on the Klamath has been working night and day, taking out good pay gravel.

The Hop Yick company of Chinamen, who have been working the Montezuma mine near Callahans, this season, have made that property pay handsomely. This mine comprises about 60 acres, lying along the bed of the South Fork of Scott river. The bedrock lies from 20 to 30 feet below the water level.

The Klamath Flume and Mining Co. expect to have their plant in operation in 1898. When their ditch and flume are finally completed, which will furnish them with the water for their giants, they will have one of the finest water privileges in the State. This company has a number of acres of fine placer ground along the Klamath, and from prospects that have already been made, at different points on the property, they will be rewarded for the expenditure of their capital.

Most all of the hydraulic claims on the Klamath are waiting anxiously for the fall rains, so they can begin operations on their mines, although it will be the first of the year before many of them can begin. The season has been shorter this year than usual, but the mines have paid well in nearly every instance.

Journal: The recent rich strike in the Schroeder mine on Deadwood, means much to the future prosperity of Siskiyou county, as the future of any section depends largely on the permanency of its lode mines. Heretofore the cry has been that our ledges do not carry value in depth. The fault has been in the operators, not in the mines. Comparatively low grade on top, this ledge has steadily improved with depth, and on the 1200-foot level shows an ore body 4 feet wide of quartz. The old Spencer mine is to be opened by San Francisco men. Worked to a depth of 190 feet, it yielded a large amount of $100 ore. At this depth a zone of low-grade quartz was struck, and, with very little further investigation, the pumps were pulled and the work suspended. Prospectors on Greenhorn creek, a tributary of Yreka creek, are constantly finding bunches of rich paying pockets and taking out considerable gold from the placers at bedrock.

Trinity.

Journal: Owing to the flooding of the Altoona company's mine only twelve men are working there at present. The old pumping works were found to be incapable of handling the flow and a new boiler and pumping plant are in operation now. As soon as the mines are pumped dry and it is demonstrated that the water can be kept under subjection work on a large scale will be resumed. When the mine is being actively worked seventy-five men are employed, and indirectly it supports 155 men. It requires twelve cords of wood a day to keep the furnaces going. The mine runs ten months in a year.

A large amount of iron pipe is passing through Weaverville for the Cle F'se Company at Junction City to be used in the construction of a siphon to carry water to the Keno claim, one of the properties of the company. The largest pipe is 34 inches in diameter. The line will be about 6000 feet in length. Preparations are now being made at the mine to lay the pipe under the management of E. Saladin, superintendent of the mine.

Tuolumne.

The Tarantula mine is to have new hoisting works. Drifting continues on the 100 level.

Two and one-half tons of ore shipped from the Manzanita mine to the Selby smelter footed up $145.

The Tuolumne Water Company has rejected all bids for the building of a cob-work timber dam on the river near Hale's mill. The lowest bid was $19,000, being $3000 above the engineer's estimate. The company has decided to construct the dam itself.

Banner: At the Gerrymander, J. L. Joseph supt., the main shaft is down 210 feet. The 5-stamp mill is hung up owing to a lack of water power. This handicap will be done away with, with the return of a full water supply, when a fine modern stamp mill and air compressor will be put in. There are 2000 tons of high-grade quartz on the dump.

The Marble Point is an East Belt property near the main Tuolumne river, in the Buchanan district, recently opened up by the Diamond Consolidated Gold Mining & Milling Company. The main or level tunnel has been driven in 50 feet on the vein.

At the Rawhide in the south drift of the 600 level, the face of the drift shows an 18-foot ledge, which when put through the mill gives large returns. In the 600 a fine body of ore is in evidence as is the case in the 1100.

Wm. Boyle has taken charge of the Carolyn mine. At the Modoc work is still being prosecuted on the lower tunnel. The Ready mine has been bonded to a company who contemplate building a 10-stamp mill.

Independent: The Gold Bug has been bonded by Campbell, Fitzpatrick and Burns of San Francisco. A two-compartment shaft 4 feet 6 by 8 has been sunk 50 feet. The company will erect a hoist.

It is reported on good authority that the old Soulsby mine will soon start operations again. It has been closed on account of disagreement between the shareholders.

The Yellow Jacket at Arrastraville has passed into the hands of Dutch Gold Mining Company.

Tuolumne county does not get the benefit in the records of the output of the Dead Horse. The rich sulphurets are taken to Angels Camp for treatment. The mine is producing more gold than ever from the deep 1400-foot level, and the 20-stamps are never left idle.

On the grounds of the Tarantula, Surveyor Hopper has been surveying for a hoist site. The excavation will require the removal of 20,000 cubic feet of rock.

Yuba.

The Allison & Co. mine at Smartsville, leased from the Marysville Quartz Mining & Tunnel Co., ceased operations last week, the new machinery failing to find the pay dirt.

NEVADA.

The Jackson cyanide plant near Silver City is running on about ten tons daily.

After the fire at the North Mountain mines, Egan canyon, several miners left for Utah; but when the owners uncovered the mouth of the shaft they found the fire only extended down the shaft some 50 feet, which will prob-

ably soon be repaired when the mill will be in full operation again. Meanwhile there is over 3000 tons of ore on the dump, by measurement, and the mill will keep grinding.

The De Lamar *Lode*, in its summary of the week, says: The De Lamar mill is now making a record for fast work that is hard to beat. One thousand and forty tons is the latest. The entire mill is in first-class shape now and is far surpassing all past records.

The Grande Oro placer location of 4,000 acres, at the mouth of Gold canyon, at and above Dayton has been thoroughly tested, yielding over $90,000 in the last two years, and is still turning out over $1,000 per month. A shaft 45 feet deep has been sunk at Dayton, showing gravel prospecting from two bits to a dollar to the pan, but a very strong influx of water prevents deeper sinking. A long bedrock tail race from an eligible point below on the Carson river will eventually be brought up at a heavy expense to effectually drain the whole country.

At Horseshoe Bend, on the Carson river, twenty-four miles above Carson, an extensive gravel gold deposit has been more or less prospected for the last three or four years but without paying results, it being very fine float or drift gold, difficult to save, and with but little fall for washing and drainage. A shaft has been started to test its deeper aspect and possibilities.

The *Lyon Co. Times* says Peck Bros. have arranged for the purchase of the Logan and Hully mine in Palmyra, having a ninety-day option on the mine for $70,000. They will ship a carload. Should it be demonstrated that the ore can be successfully worked by the process contemplated, the sale will probably be closed at once. A carload of material from the Douglass tailings reservoir will also be shipped. Should these objects be accomplished a $30,000 or $40,000 reduction plant for Dayton, a tramway from the mill to the mine a distance of ten miles and the employment of a large force of men will result.

The Gold Creek *News* says that the beneficial working of the new mining law is seen in the development of Island Mountain. It is now covered with 10 foot holes, dug this summer, showing up good ore, while older sections have been held for years without a stroke of work.

White Pine *News*: At the Star mine Supt. Farren has machinery on the road for the 20-stamp mill, and tests will be made to find the best process of working the ore preparatory to erecting a 200-ton capacity mill for which there is an abundance of ore in the mine.

OREGON.

Trefren & Snowgoose Bros', mine near Merlin is a bar claim in Rogue river and is mined by the wing-dam method. They have been on the pay streak channel for three weeks, taking out $40 per day, with an expense of $15 per day.

Judge W. H. Reid of Tacoma has bought the Hammersley mine on Jump-off-Joe.

WASHINGTON.

At a recent meeting of the Methow Mountain Mining Company it was decided to let a contract for development work.

BRITISH COLUMBIA.

A Nelson dispatch says at the Hall mines smelter Supt. Nichols, who assumed charge the morning of the 1st, resigned that evening. Robert Headley, formerly of the Pilot Bay smelter, has charge. A permanent superintendent is to be sent from London, it is said.

The Hall mines smelter reports the following business done during the four weeks ending August 27th: There were 5766 tons of ore smelted, which yielded 522 tons of matte, containing (approximately) 232 tons of copper, 157,360 ounces of silver and 215 ounces of gold.

J. M. Harris, president Reco Mining Company, proposes to drive a crosscut tunnel through Noble Five mountain—2 miles long, 12 feet high, wide enough for a double car track, and chambered the entire length so as to allow for drainage and natural ventilation. These workings would tap at a great depth, thousands of feet in some instances, and within a distance of two miles several rich leads, all of which parallel the main Slocan belt.

The shipments of ore from Sandon from August 1st to September 9th, inclusive, were as follows: Slocan Star, 1160 tons; Ruth, 1140; Payne, 1598; Idaho mines, 426; Noble Five, 235; Reco, 100; American Boy, 16; Slocan Boy, 15; Wonderful, 13; total, 4704 tons.

A shipment from the Athabasca mine, near Nelson, last week, consisting of twenty-nine tons, gave a smelter return of $97.70 per ton. Twenty-seven men are now employed at the mine and only a portion of the ore taken out is being shipped. The balance, which is free milling ore, is being put to one side for the mill, which will probably be erected this winter.

Shipments from the Nelson smelters last week were as follows: Hall Mines smelter, 94½ tons matte; Trail smelter, 79 tons matte; total value, $87,988.98.

At Ainsworth the Petersons of Philadelphia are erecting a plant that will handle 200 tons a day. They will handle ores for $2.75 per ton. The Pilot Bay smelter has announced free transportation of ores on Kootenay lake for treatment at its smelter, and instead of following the example of the Hendryx smelter and charging a few dollars more per ton than was charged at American smelters, to support home industry, the Pilot Bay people promise a much lower rate than the existing $21 freight and treatment charge.

THE KLONDIKE.

The following may be read with profit by those who contemplate a sojourn in the Yukon valley. The report is made by Assistant Surgeon A. E. Wills:

"Men should be sober, strong and healthy. They should be practical men, able to adapt themselves to their surroundings. Special care should be taken to see that their lungs are sound, that they are free from rheumatism and rheumatic tendency, and that their joints, especially knee joints, are strong and have never been weakened by injury, synovitis or other disease. It is also very important to consider their temperaments. Men should be of cheerful, hopeful dispositions, and willing workers. Those of sullen, morose natures, although they may be good workers, are very apt, as soon as the novelty of the country wears off, to become dissatisfied, pessimistic and melancholy.

"The climate is wet. The rainfall last summer was heavy. Although there is almost a continuous sun in summer time evaporation is very slow, owing to the thick moss which will not conduct the heat, in consequence the ground is always swampy. It is only after several years of draining that the ground will become sufficiently dry to allow the frost to go out, and then only for a few feet. During the winter months the cold is intense, with usually considerable wind.

"A heavy mist rising from open places in the river settles down in the valley in calm extreme weather. This dampness makes the cold to be felt much more and is conducive to rheumatic pains, colds, etc.

"Miners are a very mixed class of people. They represent many nationalities and come from all climates. Their lives are certainly not enviable. The regulation 'miners' cabin' is 12x14 feet, with walls 6 feet and gables 8 feet in height. The roof is heavily earthed and the cabin in generally very warm. Two, and sometimes three or four men, will occupy a house of this size. The ventilation is usually bad. Those miners who do not work their claims during the winter confine themselves in these small huts most of the time.

"Very often they become indolent and careless, only eating those things which are most easily cooked or prepared. During the busy time in summer, when they are 'shoveling in,' they work hard and for long hours, sparing little time for eating and much less for cooking.

"This manner of living is quite common among beginners, and soon leads to debility and sometimes to scurvy. Old miners have learned from experience to value health more than gold, and they therefore spare no expense in procuring the best and most varied outfit of food that can be obtained.

"In a cold climate such as this, where it is impossible to get fresh vegetables and fruits, it is most important that the best substitutes for these should be provided. Nature helps to supply these wants by growing cranberries and other wild fruits in abundance, but men in summer are usually too busy to avail themselves of these.

"The diseases met with in this country are dyspepsia, anæmia, scurvy, caused by improperly cooked food, sameness of diet, overwork, want of fresh vegetables, overheated and badly ventilated houses, rheumatism, pneumonia, bronchitis, enteritis, cystitis and other acute diseases, from exposure to wet and cold; debility and chronic diseases, due to excesses."

The steamer Farallon arrived at Seattle, Wash., on the 16th, from Skaguay and Dyea with thirty passengers, who have given up the attempt to reach the Yukon gold fields this winter. C. F. Shaw, representing an English syndicate, accompanied by a party of seven, took passage on the Farallon from Fort Wrangle and is in Seattle. He has been prospecting the divide between Cassiar and the headwaters of the Yukon emptying into Lake Teslin. He reports the existence of large quartz ledges of the same grade as the Treadwell, but they cannot be worked with profit on account of not being able to get machinery. Mr. Shaw says that these difficulties will be overcome by the construction of the Cassiar Central Railway and the Teslin Lake Railway, which is now being surveyed by the Canadian Government on Stickeen river. Shaw believes that Fort Wrangle will be the point of departure for all goods and machinery that will be sent into that part of the country. He intends sending in an outfit of twenty men via Wrangle, the Stickeen river and Teslin lake next spring with instructions to prospect the more remote districts of the headwaters of the Yukon immediately adjacent to the old Cassiar gold diggings. The placers on this divide undoubtedly have derived their quartz reefs in the immediate vicinity, as Shaw has in his possession a quantity of placer gold which is quite unworn and full of quartz.

The purser of the Farallon says there is a scarcity of boats at Lake Bennett and that they are bringing upwards of $500 each.

Sulphur creek, a branch of Dominion creek, which is a tributary of the Indian river, is the scene of the latest gold excitement in the Klondike. Gold is reported found just below the surface running $34 to the pan. A stampede followed the reports of the new finds, which reached Dawson City August 15th. In a week five hundred men had crossed the mountains between Eldorado creek and Dominion creek. They traveled day and night, and in two weeks the whole stream was staked out. J. E. Light, who left Dawson City on the steamer Bella, August 18th, owns a claim on Sulphur creek. He says: "When I first heard of the strike on Sulphur creek I went over the mountains to investigate it. I spent one day with two brothers, the McKinnon boys, of Wellington, B. C. I saw them take out $300 in one day from simply sinking two prospect holes. The formation is the same as at Eldorado creek. It bears the same relation to Dominion as does Eldorado to Bonanza. The streams empty into the Indian river. They are just across the divide from the Klondike. Of course, when the news of the new discovery reached Dawson there was a great stampede and hundreds left the Klondike for Sulphur creek. It is all staked out now."

Louis Sloss, Jr., of the Alaska Commercial Co. arrived from St. Michaels on the steamer Excelsior on the 15th. He says there is no food to be had in that country and very little can be got up the river this winter. The rush is greater than anybody up there expected, and so the trading companies were unprepared to supply the miners. His company tried to keep the people out, but to no avail. He left Dawson August 18th, but spent some time at other points on the Yukon. It's the same all along the river—a lack of food, but apparently lots of money. All the supplies that have been taken up were already ordered and paid for, so that no extra provisions are to be had. "If there is not a famine in Dawson this winter," he says, "I will be greatly surprised."

A. J. Green says: "One notable feature observed on arrival at Dawson City is that every man who has been there over winter and has made any money wants to get out, and the more money he has the more anxious he is to go. Nearly every one who has a mine wants to sell and come out in the spring, and those who can't sell look forward to next spring's cleanup, when they are sure to come. There is not much building in Dawson City, for town lots and building logs have been so high that the luxury of a house could not be afforded. The people are nearly all living in tents, and I do not know what they will do this winter. Wood was $14 per cord when I left, and everybody predicted that it would be $30 a cord this winter. Wages are $10 to $15 per day, but when one considers that the laborer has to pay such exorbitant prices for everything, he don't come out much ahead."

UTAH.

Park City *Record*: The Ontario Company is still working the mine with a small force and extracting ore, and the Marsac mill has commenced its test run on the Ontario tailings. The ditch for the new Silver King pipe line is about completed and ready for the 6-inch steel mains that will hereafter supply the mine and reduction works with water. The camp has steadied down to a normal condition now, and the fright is over. Many people have gone away, but a great many—between 4500 and 5000—still remain, and business goes on as usual.

Tintic *Miner*: During the past week the Bullion-Beck Company has commenced prospecting in a new direction with the intent of putting that mine into line as a gold producer. While it is generally overlooked, it is a fact that several years ago the Beck sent out a considerable quantity of high-grade gold ore. This ore was discovered between the 600 and 700 foot levels, about 1000 feet south of the shaft, and was followed through to the 850 level, where the vein was lost. Several tons of the ore was marketed, which showed values in the neighborhood of $400 to the ton. A winze was sunk 100 feet below the 900-foot level, but was abandoned on account of not finding the gold vein. During the past week an 8 H. P. engine has been put at the top of the winze on the 900 level and drifting south in search of this lost vein has commenced. Supt. Kirby is confident of being able to find the gold. The great silver-lead stope north of the shaft is holding out in good shape and at the 1150 level is as strong as ever. About eighty tons of this ore is being hoisted daily.

IDAHO.

At Osburn, owing to the low price of silver, the Nellie and Mineral Point, each of which has been making occasional shipments for months past, have closed down. Their ores are gray copper.

The Elmore mine and mill at Rocky Bar, Mr. Church manager, has renewed development work. It will take four weeks to dry the mine.

At Murray the Anaconda Gold Reduction and Revivification Company will crush its ores by rolls, driven by steam. No other machinery of consequence will be used.

Supt. E. H. Dewey of the Florida Mountain Mining Company has instructions from the Eastern office of the company to discontinue all work upon the property, due to the dull outlook for silver.

W. H. Watt is appointed receiver of the Red Elephant mine at Hailey, owned by the G. V. M. Mining Company, in foreclosure proceedings by the First National Bank of Hailey on a mortgage for $6500. The Red Elephant has been one of the best silver properties on Wood river.

J. D. Gibbons of San Francisco is on the Snake river, where he has a new machine for saving fine gold. The machine is operated by electricity furnished from a dynamo which charges a powerful magnet. This magnet will lift a body of iron weighing 250 pounds if placed within 18 inches of it. By the use of this machine its inventor claims that all the gold will be saved, as well as the iron sands in which the gold is found on the Snake river. He claims that this iron sand makes the finest of razor steel, and the gold is not only separated from this and saved, but the sand is melted by electricity into pig iron. He claims the iron alone will pay all operating expenses of the machine, leaving the gold as clear profit. The machine costs about $600 besides the engine and dynamo, and has a capacity of forty tons of sand per day. Two men besides the shovelers will be required to operate the machine. The first test will be made at Lewiston.

The Wallace *Tribune* says that never before was there such activity in the Cœur d'Alene country as at present. Between 1200 and 1300 men are working for wages in mines that are producing ore, besides 200 or 300 more who are doing assessment or development work, some for wages and others on their own account. Over 15,000 tons of concentrates are turned out every month.

Hailey *Times*: The Red Elephant mill was started up the 2nd inst. with a sufficient ore supply to keep it going between two and three months. From 35 to 40 tons of ore, making 2½ to 4 tons of concentrates, are run through per twenty-four hours.

MONTANA.

At Basin the Katie people will soon commence building a 500-ton concentrator and a smelter. C. M. Allen of Butte will superintend the work.

The first car of concentrates from the Keystone mine was shipped from Leonia September 1. There are now several cars on hand at the Keystone mill at Sylvanite, which is being shipped to the United Smelting Company at Great Falls.

Dredging having been so successful at Bannack it is being tried with profit elsewhere. Another dredge is being successfully operated twelves miles from Avon. It differs from the first dredge put in, in that it runs on a truck. The Helena *Independent* says the dredge for Prickly Pear creek will apply a still different principle to the process of raising the gravel. It will be by means of a large suction pump that will take the gravel clear down to bedrock and convey it to the sluice boxes, where the treatment will be much the same as in other dredges. The Avon dredge is saving the gold and making money for its owners.

MISSOURI.

Joplin correspondence *Journal of Commerce*: Lead ore advanced again during the past week $1 per 1000 pounds and was in great demand, but zinc ore declined 50 cents a ton. The weather was favorable for mining, but the output was considerably reduced on account of many mines being shut down several days to allow the miners to attend the various attractions occurring in the mining vicinity.

The top price paid for zinc ore in all portions of the district except Springfield was $22.50 per ton. One carload of Springfield ore brought $23 per ton, the top price of the preceding week. Most of the zinc ore brought from $20 to $22 per ton. The average price paid for zinc ore was 50 cents per ton less than the preceding week, there being a general decline in all grades. Considerable of the Joplin ore, all of the Stotts City, Alba and Oronogo product brought $22.50 per ton.

Lead ore started in at $23.75 per 1000 pounds, delivered, and on Friday advanced to $24.75. The week closed firm at those figures, with indications of still further advances this week. The demand for lead ore was very strong, and since many of the low-grade silver mines, which reduced a great deal of galena, have shut down, there is considerable outside demand for Missouri lead ore.

The shipments of zinc ore were twenty-six carloads less than the preceding week, but were thirty two carloads more than the corresponding week of last year. There was an increase of 3,980 pounds in the week's sales of lead over the sales of the preceding week and an increase of five carloads over the sales of the corresponding week last year. The price paid for lead ore last week was $10.25 per thousand pounds more than during the corresponding week last year.

Following are the district sales of zinc and lead ores for the week ending September 4, and the sales of the year up to date:

Mines—	*Zinc.*	*Lead.*	*Value.*
Joplin	849,790	327,310	$ 17,963
Carterville	1,161,430	170,820	15,954
Webb City	683,700	44,110	7,928
Galena	2,820,000	306,000	33,120
Aurora	672,000	30,000	6,191
Stott City	118,310	41,840	2,348
Oronogo	140,470	4,950	1,635
Springfield	98,750	25,000	1,711
Belleville	10,440	16,840	531
District total for last week	6,564,890	967,170	87,381
District total for 36 weeks	230,062,370	38,540,560	$2,839,158

COLORADO.

The Pueblo smelter handles more Slocan, B. C., ore than any other. The August shipments to Pueblo were 5,124,595 pounds out of a total of 7,784,995.

The Colorado Springs *Telegraph* says the output for the Last Dollar for the past month was 54 carloads of ore—18 high grade and 36 cyanide ore. Work was started again on shaft B, which will be sunk 200 additional feet.

The output from the Legal Tender for August was 1500 tons—100 tons of high-grade ore worth $100 or more to the ton, 300 tons of smelting ore at $60 to the ton and 1100 tons of cyanide ore which will give a valuation of $30 to the ton.

The Telluride *Journal* says there is now a prospect for greater activity in the mining business in this county during the coming winter than ever before in the history of the camp. The larger properties are increasing facilities for enlarged production of the precious metal, and smaller properties are endeavoring to reach substantial and paying operations by adding to working capacity. New properties are coming into notice, some of which bid fair to become, with systematical development, the richest producers of the district. Several mines will continue working throughout the winter, which heretofore have shut down, more mills work and at greater capacity, and altogether the prospect is very brilliant.

A power scheme is organized by the Leadville Power and Electric Company for the transmission of electric power for mining operations. The electricity is to be generated by water power, brought from a point on Lake Creek about five miles northwest of Leadville.

The new roasters of the Colorado-Philadelphia chlorination plant at Colorado City were blown in on the 15th, increasing the capacity of the plant from 170 tons to 240 tons daily.

Says the Cripple Creek *Citizen*: Placer mining in connection with lode claims may seem somewhat of an anomaly, but nevertheless placer mining methods are being carried to a successful issue by Malins & Co. in their treatment of the Vindicator dump, which they are working under lease. The idea is novel and has proved so much of a success that the plan has already been adopted by other dump lessees. The system in question is simply the washing of all dump ore too coarse to go through the screens. The sediment thus obtained has been found to be extremely rich in gold values and runs as high

as $300 to the ton. After the dump rock has been run over a screen, or if it should be too wet to screen the rock is dumped into a large trough about half filled with water and fitted up with a false bottom of perforated iron. It is then stirred and sifted with a fork, the talc on the rock is washed off and as a matter of course filters its way through the perforations of the false bottom, from whence it is taken after the water has been drained off, and a cleanup is made. The sediment is then spread out on canvas for the moisture to evaporate and then sacked. This method is a simple and inexpensive one, and should be practically applicable for the treatment of dumps of mines in which high grade talc leads are found and which it is next to impossible to clean from the waste rock.

NEW MEXICO.

Notice has been posted at the Blossburg coal mines, operated by the Raton Coal and Coke Company, of a reduction of 10 per cent in wages, to take effect immediately. The present price is 65c., with scant employment.

At Trinidad the Chicago & Trinidad Gold Smelting Company, formed for the purchase and operation of the Copper King smelter, hope to have the plant in active operation this winter.

A special to the *Republican* from Santa Fe says: The Chaffee estate of Denver, L. M. Lawson of New York, Senator S. B. Elkins of West Virginia and R. C. Kerens of St. Louis, owners of the Ortiz mine grant in South Santa Fe county, have sold the property to a New York and London mining syndicate for $1,500,000. The property consists of 69,000 acres, which includes much of the gold-producing territory in New Mexico, and is in the hands of the New Mexico Mining Company, of which the above are the principal stockholders. L. S. Burns, an English mining expert, has spent six months investigating the mineral resources thereon, and his report has recently been verified by Mr. Fleming.

The Jumbo group of fifteen full mining claims in the La Belle district has been sold to an Ohio company.

Seventy men are employed on the Confidence mine, in the Mogollon district, and are taking out plenty of ore to keep the mill supplied.

Forty men are now employed on the old Hanover mine, in Grant county, and the mine is shipping almost 120 tons of ore per week to the Copper Flat reduction works.

The south drift on the 300-foot level in the Texas, Central district of Grant county, has been driven 85 feet from the shaft, and 12 inches of high-grade argentite disclosed.

The following from the Las Vegas *Optic* is a good sample of a newspaper account of "a big strike:" "W. S. Williams is superintendent for the Monte Cristo placer mining company of Kansas City. Recently he entered into a contract with M. Harrold, the Pennsylvania well expert, to sink a tubular well for the purpose of supplying water to wash the rich placer deposits owned by this company in "Old Timer" gulch, near Golden. They sought higher ground, and leased from the above named Las Vegans the privilege of locating the well on their property. At the depth of 350 feet it was noticed that the drill was bringing up pure white quartz carrying free gold. The stuff was panned and grains of the yellow stuff as large as an average grain of wheat were revealed. The miners of the camp went wild. The well was being sunk in virgin ground; no mining shaft in the vicinity had ever attained one-fifth of that depth, and it was recognized that a great find had been made. Yet nobody, not even the most enthusiastic, was prepared for what came after. As the well tools pounded away the white quartz ledge was shown to be thicker and thicker, and now after reaching a depth of 500 feet it has been demonstrated that underlying the surface ground owned by these Las Vegans there is a free gold deposit of at least 50 feet, the whole of which prospects $1000 to the ton and upward. Within this extraordinary deposit has been encountered a flowing underground river—its roar is akin to a small Niagara—which is good for the placer miners, but tough on the lode miners, who must sink a shaft, or several of them, to get at these newly found riches. It will probably cost, considering the quantity of water in sight, $20,000 to sink a shaft 400 feet there, but nobody questions the ability of Manzanares et al. to go after the great riches which have thus been shown to exist beneath the surface of their south Santa Fe county mining claims."

ARIZONA.

The wages of the miners employed by the Commonwealth Mining Company at Pearce are to be cut to $2.50 per day. Pearce has been a $3 camp.

At Saginaw camp, nine miles from Tucson, three carloads of machinery are being hauled to the mine, the crushing capacity being increased to 100 tons per day. The company have forty-eight men employed.

Crittenden reports that a twenty-eight-day run of the Empire smelter resulted in 250 tons of bullion of lead, silver and gold of the value of about $200 per ton.

At Rosemont the company has shipped 150 tons of copper bullion carrying a good percentage of gold and copper. About forty men are employed.

The work of rebuilding the Kasser Gold Mining Company's mill (ten stamps) in Lost Gulch is finished. The structure has been erected to accommodate ten stamps more, which may be added next year. It is expected that the stamps will drop about Oct. 1st. The Globe paper says it is the intention of M. W. Gibbons, general manager for the company, to sink 500 feet.

LOWER CALIFORNIA.

The schooner Anita is at San Diego from Santo Domingo with two gold bars, one valued at $5967 from the Ibarra mines at Calmalli, and the other worth $2933, from the Viznaga mine at Mexican Gulch. The first bar represents two months' work on the tailings, which are being worked over by the cyanide process,

PERU.

F. J. McKenna of Denver, Colo., has gone to Arequa, Chile, where he will manage the Choquelempie mine and mill for the owners, Deves & Co. of Tacna, Chile. The property is one of the oldest working mines in the world, having a record running back into the fourteenth century. From the Spanish records running to the early part of the sixteenth century, soon after the Spanish conquest, it is shown that the mine had been worked by the natives not less than one hundred and fifty years prior to the advent of the Spaniards, and it has been operated more or less continuously ever since. It is a silver mine and has produced an enormous amount during the five hundred years or more. It is located sixty miles from the coast, Arequa being the seaport of Tacna, at an elevation of 14,000 feet. The ore is rich and carries a high percentage of lead. It is sent to Germany for treatment, the freight charges being $8 per ton. From the mine to Arequa it is packed on llamas and mules. There is a large body of low-grade ore which will be concentrated, the owners having recently purchased machinery for concentration. Coal is $25 per ton; the fuel is wood.

The Beam Process.

A Colorado correspondent furnishes the following description of the Beam roasting and converting process, as is demonstrated by the experimental plant erected in Denver by Steele, Bristol & Co.:

The furnace is constructed of red brick, fire brick, tiling, fire clay and cement, forming a series of airtight muffles, 6x6 feet each, which in this plant are capable of roasting 500 pounds of ore at a charge. The roasting is done with a low degree of heat, and thus sulphides are converted into sulphates, leaving the gold in free condition. The roast is made for the first twenty-five or thirty minutes without air, during which time, it is claimed, the conversion takes place. Then a blast of hot air is introduced through pipes and valves arranged for that purpose. They further claim that before the hot air is introduced the product is in a condition which absolutely precludes the possibility of a loss by volatilization, and that for this reason their roasted product usually shows values in excess of that indicated by assays of the raw material. It is necessary to crush the ore to a 40-mesh before roasting, and after the roast the product is reground to an 80-mesh. In this condition, it is asserted, the ore is ready for any method of amalgamation desired.

Personal.

T. A. RICKARD of Colorado is now at Kalgoorlie, Australia.

JNO. W. MACKEY arrived in San Francisco from New York City last Wednesday.

L. L. ARCHER succeeds J. F. Parsons as general manager of the Dexter M. Co., Tuscarora, Nevada.

W. H. STORMS, superintendent Junction mine, Tuolumne county, Cal., is in the city purchasing supplies.

A. S. MILLER of San Francisco has been appointed to the Chair of Mining and Metallurgy in the University of Idaho, Moscow, Idaho.

HULET MERRITT, Jno. D. Rockefeller's private secretary, is en route to California with a view to mining investments herein.

GEORGE W. MAYNARD of New York is in Esmeralda county, Nev., where he has taken charge of the mining property at Silver Peak.

A. P. SCHNEIDER, the new manager, has started up the Red River, N. M., smelter after an enforced idleness of several months.

E. M. DOUGLASS, who has charge of all U. S. geodetic survey work west of the Mississippi, with R. M. Goode, is in Salt Lake City, Utah.

COL. W. S. KEYES, the California member of the Committee on Revision of Federal Mining Law, leaves for Denver to-morrow to attend the meeting there next week.

L. N. MCQUESTEN, who has been in Alaska for 26 years and has two stores, at Circle City and Forty Mile, arrived on the Excelsior last Wednesday. Like all the rest, the pioneer says nothing but the improbable arrival of thousands of tons of provisions at Dawson City will prevent a famine there next winter. McQuesten went to Alaska as an employe of the Hudson Bay Company, but from trading went to prospecting. He has grub-staked many a miner and is known all through the region for his numerous acts of generosity. He is the founder of the Alaska Pioneers' Society, members of which must have lived for seven consecutive years in the territory.

Coast Industrial Notes.

—The Sierra Wood & Lumber Co. will build a box factory, to cost $12,500, at Truckee, Cal.

—The National Government will now go ahead with the construction of a breakwater at San Pedro, Cal., and will push the work.

—The California State tax rate for 1897 has been fixed at 51 cents on each $100 worth of assessable property as against 42.9 last year.

—The Puente Oil Co. is daily producing 800 barrels of oil at Chino, Cal., and is trying to stand up against a local onslaught of the Standard Oil Co.

—W. A. Platt has made preliminary survey for a railway from Takua to Lake Teslin, Alaska, via the Trahaua river, 140 miles, and says the route is feasible.

—In Lakeview, Or., this week Reynolds & Edson are buying beef, says the *New Era*. They are paying 5 cents for three-year-old steers and 4 cents for cows.

—C. B. Jones is en route for Peru to begin construction of a railway from the present terminus of the Peruvian road, Paieasmayo, toward the head of navigation on the Amazon, the present scheme being to tap the Hualgagoe mining region in the Andean Cordilleras.

—The Randsburg, Cal., Railway Company has contracted with the Union Construction Company for the construction of its railway from Kramer to Johannesburg, to be completed and in operation by Dec. 10, '97. The road will be owned and operated as an independent line.

—From Yokohama comes the doubtful report that "a syndicate has been formed there for the purpose of telegraphically connecting Yokohama direct with San Francisco via Hawaii. The cable will cost $11,000,000, and the Japanese Government has promised to defray $500,000 of that sum."

—A. M. Allen of Oakland, Cal., who for some time past has had an option on the Carmelo coal mine, near Point Lobos, ten miles from Monterey, will commence the preparatory work necessary to get the coal out. The Carmelo mine has been shut down for four years. Formerly bituminous coal was shipped to San Francisco.

—The problem of how to obtain help enough to harvest this year's crop has become a serious one to the fruit growers of California. One employment agency has places open for 3000 men in Fresno and Tulare counties alone, while Napa, Sonoma, Yolo, Santa Clara and Yuba counties are not far behind. Last year for this class of work men were paid $20 a month and board; now $1 a day and board is the regular thing, and with this rise as an inducement the demand for men is greatly in excess of the supply.

—Poor's Manual for 1897 shows that of the railways of Washington, Oregon, California, Nevada, Arizona, Utah and Idaho in 1884 their gross earnings aggregated $33,530,716; in 1896, $56,575,922; in 1884 the percentage of expenses to earnings was 59.21; in 1896 it was 68.45; in 1885 it was 55.71, so that the increase from 1885 to 1896 was 12.74 per cent. In 1884 the railroads of this group paid 4.52 per cent interest on their bonded debt and 1.75 per cent dividends on their capital stock—a total of 6.27 per cent. In 1896 they paid 6.21 per cent on their bonded debt and one-hundredth of one per cent on their capital stock. At the close of 1896 the Pacific States had a railway mileage of 14,141 miles, divided as follows: California, 4948; Oregon, 1525; Washington, 2811; Nevada, 915; Arizona, 1412; Utah, 1441; Idaho, 1087. In 1860 they had but 23 miles of railway—all in this State. In 1870 Oregon had 159 miles of railway, but Washington and Idaho had none. In 1880 Washington had 289 miles; Idaho, 206.

—It is stated that the negotiations between the Vanderbilt railroad system and the Los Angeles Terminal railroad for an extension of the former's road from Utah to San Pedro harbor, Cal., have been settled and the route selected in a southwesterly direction from Milford, through the southern portion of the State of Nevada, passing through Las Vegas valley, across the Mojave desert, crossing the Atlantic and Pacific railroad a few miles from Ludlow station, thence in a direct line to the Morengo pass, then heading for the San Gorgonio pass to Redlands and Riverside, to Chino, north to Anaheim, to Los Angeles and San Pedro bay.

—The shingle mills of Washington State are operating on large advance orders, and an average from 60 to 75 carloads are being daily shipped out of the State to Eastern markets. It is thought that this year's output will be 2,500,000,000 pieces, valued at $3,000,000—an increase of 40 per cent in shipments and 50 per cent in value, arising from advanced prices. The lumber cut of the State, which was last year approximately 500,000,000 feet, valued at $4,000,000, will bring in about $5,000,000 during 1897 according to present indications, giving a total income from Washington forests of $8,000,000—an increase of about $1,500,000 over '96.

—The greatest run of salmon ever known in the Pacific Northwest has just ended. It is estimated that 1,500,000 Sockeye salmon were captured in the Fraser river during the past season, which was at its height from July 21 to August 5. The prices for the season average 22 and sometimes 35 cents for each salmon. The oversupply this year has been so great that the fishermen were glad to get 3 cents apiece for their fish. As a consequence, the market prices of canned salmon this year will be the lowest ever known on the coast. Upward of 5000 men were employed during the season, two-thirds of whom were Japanese. A conspicuous feature in connection with the big catch is that humpback salmon by the hundreds of thousands were thrown out of the traps to die on the mudflats.

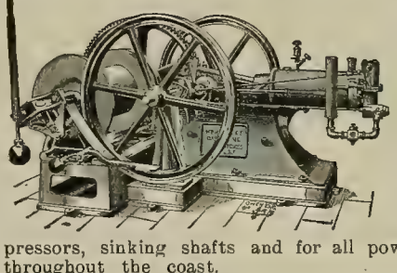
Hercules Hoisting Engines



Solve the difficulty of fuel, and make mining profitable where steam power is too expensive. Over 3000 Hercules Gas and Gasoline Engines are in use giving entire satisfaction. Fully guaranteed. Requires no engineer. No smoke, no dirt. No danger.

We build engines from 2 to 200 h. p. for pumping, hoisting, running air compressors, sinking shafts and for all power purposes. Used in mines throughout the coast.

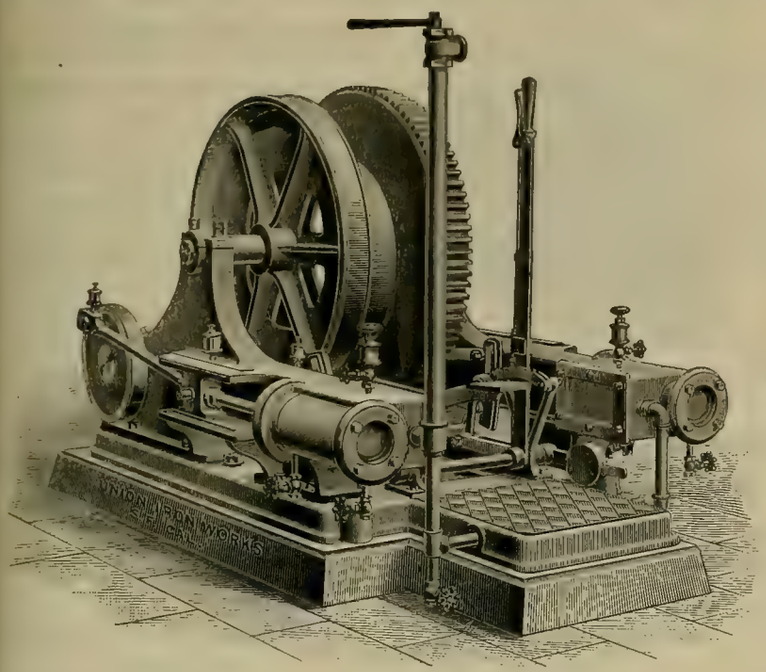
UNION IRON WORKS,

222 Market Street, San Francisco, Cal.

MAKE THIS SMALL

DOUBLE CYLINDER SINGLE DRUM HOIST



HOIST FOR PROSPECTING.

For Prospecting Purposes or Underground Work,

USING COMPRESSED AIR.

The entire hoist is self-contained, being mounted on an iron sole plate or bed which carries all the operating levers and provides a footboard for the operator. The engines are provided with reversible link motion and the drum with a broad strap brake, insuring safe and rapid work.

The general lines upon which this hoist is designed are neat, strong and substantial and all the operating parts are conveniently arranged.

The size herewith illustrated is the 4 in. x 10 in., rated at 15 horse power. The larger sizes, 8 in. x 12 in. and upwards are provided with post brakes.

Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,

330 Market Street.....San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.

Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.

Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Prospector's Field Book and Guide.

By H. S. Osborn.....$1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.

Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

Modern Copper Smelting.

By Edward Dyer Peters, Jr. Seventh edition. Rewritten and enlarged. Profusely illustrated....$5 00

Practical Treatise on Hydraulic Mining.

By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc Price, postpaid.....$5 00

Practical Hydraulics.

A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Explorer's and Assayers' Companion.

A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$5 00

The Metallurgy of Gold.

By M. Eissler. Profusely illustrated.....$5 00

Notes on the Treatment of Gold Ores.

By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

Cyanide Processes for Gold and Silver Ores.

By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Quartz Operator's Handbook.

By P. M. Randall.....$2 00

Skeleton Mining Report.

Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid....50 cts.

Stamp Milling of Gold Ores.

By T. A. Rickards, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid.....$2 50

Miners' Pocketbook.

A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. Warnford Lock. 472 pages, illustrated, flexible leather.....$5 00

Assaying Gold

.....AND.....

Silver Ores.

By C. H. AARON.

THIRD EDITION JUST OUT.

A Standard Work.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Perface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price **$1.00** postpaid. Sold by the **Mining and Scientific Press,** 330 Market St., San Francisco.

WILFLEY CONCENTRATOR.

SEND FOR CIRCULARS.

IDLEWILD GOLD MINING COMPANY—SUPERINTENDENT'S OFFICE.
TAYLOR MINE, CALIFORNIA, September 6th, 1897.

White & Rogers, San Francisco, Cal.—GENTLEMEN: Answering yours of the 27th ult., *in re* Wilfley Concentrating Table in use at the above mine, I beg to state that we have run the pulp from fifteen of our 1000-lb. stamps, making ninety-eight 5-in. drops per minute and crushing to pass through a No. 1 perforated tin screen, over one Wilfley Table for the thirty-one days ended August 31st. While the machine has been handicapped by a load far in excess of its rated capacity, said load amounting to about fifty-one tons daily, we are pleased to note that it has given us a sulphuret worth .344 per cent more than the joint product of five other machines of different types, operating under practically the same conditions. The concentrates from the Wilfley are entirely free from silica, while those from the other concentrators have carried an average of .082 per cent. We feel that further comment as to the merits of the Wilfley Table is quite unnecessary. Yours very truly,
E. W. CHAPMAN, Supt.; per Kendall.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

ENDLESS BELT ORE CONCENTRATOR.—Amos C. Springer, San Francisco, Cal. No. 589,627. Dated Sept. 7, 1897. This invention relates to that class of ore concentrators in which the pulp and water are supplied to the surface of an endless traveling belt which is mounted at an incline so as to have an up-hill travel whereby the heavier particles clinging to the surface of the belt are carried up over its higher end and are washed off below while the lighter and worthless particles pass off down the belt over the foot, the class being called "Endless Belt Concentrators." It consists essentially in the combination with the bed frame and shaking belt frame of supporting standards having convex end castings fitting corresponding concaved recesses so that the movable frame can be shaken upon these supporting standards. A means is provided for vertically adjusting one pair to vary the inclination of the shaking belt frame. A worm engaging the gear on the driving drum and a series of pulleys of different diameters on the worm shaft serve to vary the rate of travel, and with them is employed a means for tightening the belt and holding it in the proper position. The belt has independent side strips with side flanges vulcanized to the strips, the side strips being removably secured by lines of stitching. A centrally located hopper having oppositely extending inclined chutes with longitudinal partitions of varying lengths dividing the chutes into parallel longitudinal runs of different lengths form a pulp distributer, and gates are adapted to control the communication between the hopper and the runs. An underlying box or casing is provided with parallel cross runs adapted to receive the material from the openings in the chutes and discharge holes from each deliver the material upon the belt.

CARBURETOR.—Daniel Best, San Leandro, Cal. No. 589,634. Dated Sept. 7, 1897. This invention relates to an apparatus which is especially designed to produce an explosive mixture of gas from crude or other hydrocarbons for use in engines and for other purposes. It consists essentially of a means for distributing a hydrocarbon liquid over surface in thin sheets, means for admitting air which passes through the steam chambers and mingles with the vapor of the hydrocarbon, means for directing the hot exhaust products of the engine around this chamber in such a manner as the regulate the heat to which the vaporizing chamber and the incoming air is exposed. The air is drawn through this apparatus and being mixed with the vapor a gas is produced which passes directly to the engine where it is exposed at the proper times to produce the impulse which drives the engine piston.

CAN LABELING MACHINE.—John P. Simmons, San Francisco, Cal., assignor to L. C. Parke, same place. No. 589,673. Dated Sept. 7, 1897. This invention relates to an apparatus for automatically applying labels to cans while the latter are rolled by gravitation successively over the labels. This object is to improve the mechanism of the gravity can-labeling machine, and make it more accurate. It consists of an inclined runway over which the cans are adapted to move by gravitation, a label support or table interposed in the length of the runway, with means for raising it to keep the surface of the labels at a constant level, means for applying the paste, and means for rolling the labels upon the can as they pass. The table upon which the labels are placed is spring-actuated so as to keep the surface of the labels at a constant level, guides are arranged which true the edges of the labels so that they are always placed at the proper point to be accurately pasted upon the cans. A means is also provided for pressing upon the labels and holding the rear edges until they are removed by the passing of the can. The paste is delivered from a suitable receptacle into a horizontal tubular chamber, and a compartment shaft is rotatable therein so as to carry forward a small portion of the paste in each of its compartments, a spring-actuated rod pressing against the front edge of the shaft so as to wipe off the paste and deposit it upon the rear edge of the labels ready to be applied to the approaching can. The shaft is rotated by a suitable arrangement of ratchet wheels and reciprocating bars which act periodically upon it.

DINNER PAIL HEATER.—W. W. Montague and Wm. G. Dougall, San Francisco, Cal. No. 589,667. Dated Sept. 7, 1897. This invention relates to a device which is especially useful for laborers and workmen who are obliged to carry lunches or dinners. The object is to provide a cylindrical or outer casing into which the bottom of the pail may be telescoped and entirely closed, said casing having handles extending up alongside the pail latching into the cover so that the device can be carried thereby. This casing is provided with draft openings around the lower edge, an opening at one side by which access is obtained to the interior and spring latches fixed upon opposite sides and adapted to hold the pail in an elevated position so that the heat of the lamp may be applied to warm the contents. The lamp is secured centrally in the bottom of the casing, and there is a means for easily removing it when desired. By releasing the holding latches the pail is allowed to descend and its bottom serves as an extinguisher for the lamp and also forms a cap to prevent evaporation of the alcohol with which the lamp is charged.

SIGNAL BOXES.—A. C. Robbins, San Francisco, Cal., assignor to E. C. Hughes, of same place. No. 589,617. Dated Sept. 7, 1897. This invention relates to automatic signal boxes, such as are commonly used for the transmission of signals, as in fire, police and messenger service. It consists essentially of a device for automatically cutting the mechanism of a box out of the main circuit when not in use. In this class of boxes, it sometimes happens from continued disuse or other causes that the spring or brush through which the current is conveyed or the clock-work bearings become non-conductive, the result of which would be the disabling of the entire circuit. The object of this invention is to remove the liability of such interruption and this is effected by mechanism which transmits the electric current through the plate and brush independently of the operating mechanism when said mechanism is in a normal state of rest and the current is shunted through the mechanism and the latter is placed in operative condition.

ELECTRIC SWITCH AND CUT OUT FOR TELEPHONE BOXES.—A. C. Robbins, San Francisco, Cal., assignor to E. C. Hughes, of same place. No. 589,618. Dated Sept. 7, 1897. This invention relates to an electric switch and cut out mechanism for telephone boxes, and it applies principally to telephonic apparatus which is inclosed in boxes or closets such as are used in police and fire alarm systems and usually placed upon posts in the street. It consists of mechanism so arranged that the opening and closing of the door actuates it for cutting the telephonic apparatus in or out of the main circuit, at the same time placing the local telephone battery in or out of the circuit.

TELEPHONE TRANSMITTER FOR SIGNAL BOXES. A. C. Robbins, San Francisco, Cal., assignor to E. C. Hughes, of same place. No. 589,619. Dated Sept. 7, 1897. This invention relates to the use of telephones in boxes, such as are commonly used for police, fire alarm, street railway on other purposes where a narrow compact space is required for the telephone. The object of the invention is to provide means for closing or folding the long arms which the more recent improvements in carbon dust transmitters renders more convenient and perfect. The box has an outwardly opening door and the telephone transmitter arm hinged or pivoted within the box rests against the door when the latter is closed, and falls into position for use by gravitation or otherwise whenever the door is opened. An attachment is connected with the door by which the act of closing operates to raise the transmitter and enclose it within the box.

HO! FOR ALASKA'S GOLD FIELDS!

Greatest gold fields on earth. We have just published a complete guide to Alaska fully describing all her rich gold fields, telling how to get there, cost of trip, routes, etc., also mining laws. Fully illustrated; only reliable book. Facts and views secured by special correspondents right on the ground. Post yourself by securing "inside" information ahead of the crowd. For the present we will send a book free to anyone sending us 25c postage for a 3 month's trial to our big illustrated weekly family paper. Clubs of 5 and 6 books, $1. Agents send 25c for sample. Mention THE PRESS. *Weekly Sentinel*, Denver, Colo.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. VULCAN ROPEWAY

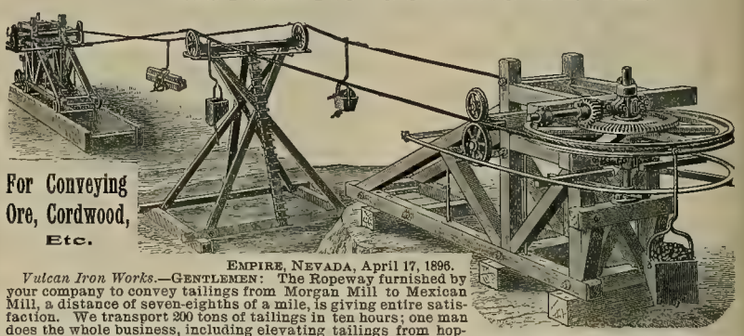
—WITH—

AUTOMATIC ORE LOADER AND AUTOMATIC DUMPING DEVICE.



For Conveying Ore, Cordwood, Etc.

EMPIRE, NEVADA, April 17, 1896.

Vulcan Iron Works.—GENTLEMEN: The Ropeway furnished by your company to convey tailings from Morgan Mill to Mexican Mill, a distance of seven-eighths of a mile, is giving entire satisfaction. We transport 200 tons of tailings in ten hours; one man does the whole business, including elevating tailings from hopper in the ground, operating Vulcan self-loader, and attending to the Ropeway generally. The self dumper requires no attention whatever. The Vulcan loader I consider the best feature in the whole Ropeway, making it possible for one man to load 200 tons in ten hours.

Yours very truly, J. P. WOODBURY, Supt.

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 16, 1897.

Business has been exceptionally good and, as prices for goods continue to strengthen, jobbers are more hopeful than for several years. The outlook is of a very promising character, bidding fair for 1898 to excel in prosperity any one year for over five years. The only cloud in the clear sky of coming prosperity is the fear that too many producers will be blinded to their own interest and not sell their grain and other produce while prices are up. The highly-colored, exaggerated reports of a shortage in the world's supply are calculated to make them hold while moneyed speculators sell out, after which will come bear reports and breaking prices. As farmers prosper, so do all industries. The inquiry for gold mining properties does not show signs of abating, but rather everything points to an increasing demand. There are more mining men looking around in the interest of Eastern and European buyers. The general tenor of advices indicates that next spring there will be a very large rush to the Yukon river and its tributaries. It looks as if it will equal the stampede to the Fraser river over thirty-five years ago. Large incorporated companies have been organized at the East and abroad for an active campaign in 1898.

The money market continues to work on easy lines, with the tendency to still greater ease, notwithstanding the free requirements for crop moving purposes. Banks report large increased deposits, which is an encouraging feature to the general situation. Conservative estimates of this season's farm products place the returns at over $60,000,000 for California alone. When is added to this large sum the receipts of our manufactures, mining and other industries, it will be readily seen that there is good foundation for asserting that 1898 will witness a still lower range of interest. The East reports active money markets, with a free call for funds for crop moving purposes.

The steamer Aztec sailed from this port on the 11th for Hongkong with the following specie: Silver bars, $150,000; Mexican dollars, $631,400; gold coin, $365. Total, $781,765.

New York Silver Prices.

NEW YORK, Sept. 16.—Following are the closing prices for the week:

Refined Silver, per oz., 1000 fine	54¾
Mexican Dollars	44½@45

SILVER.—The market made quite an advance the past week, but towards the close it is easier. On Sept. 3 sales were recorded at 51⅞ cents per ounce fine, against sales Jan. 3 of this year at 65@65½ cents. The reasons assigned for the decline have been given in previous issues, but what has made the advance we are not prepared to say, unless it is based on a demand brought about by reports that the Bank of England will use silver up to one-fifth of its reserve. Our advices from Europe state that there is a scarcity of silver money in the outlying districts of Austria-Hungary, especially in the western provinces. In Galicia and the Bukowina very serious inconvenience is being experienced owing to the scarcity of florins. The New York *Journal of Commerce* says: "It appears that not only is there a scarcity of small silver change in several of the States of the Latin Union, and in Switzerland especially, but that Switzerland is also finding her supply of five-franc pieces inadequate. It is stated that the Federal Department of Finance intends to apply to the Federal Assembly for the necessary credits for the coinage of a quantity of these pieces. The preliminary negotiations with the other States of the Latin Union have been already undertaken.

MEXICAN DOLLARS—There is a good, steady demand, which keeps the market fairly firm at quotations.

QUICKSILVER—The market is quiet but steady.

Our market is quoted at $38 for domestic consumption.

COPPER—The market has held firm at home and abroad. A New York private circular reports: Foreign consumption of copper during the first seven months of this year is on even a larger scale than during the same period last year. The increase in Germany is especially marked, and indicates rapid development in the copper trade of that country. Statistics of European copper consumption make the consumption of copper in England and France for the first seven months of this year 174,074,880 pounds. Add to this the German consumption for the same period, at the monthly average returned for the first six months of this year, and the total combined copper consumption of England, Germany and France, from January 1 to July 31 this year, is estimated at 250,962,880 pounds. According to the above figures, the copper consumption of the three above mentioned countries was only 26,785,920 pounds less than the total United States production for the first seven months of 1897. England alone is now estimated to be consuming at the rate of about 209,000,000 pounds of copper per annum. Since the year 1892 it is calculated that English consumption has increased about 93 per cent. In the same period consumption in this country has greatly decreased. Should consumption in this country recover its normal rate within the next twelve months, and no diminution take place in the foreign demand meanwhile, it is pertinent to inquire where the supply of copper would be found sufficient to meet such an increased demand.

The New York *Journal of Commerce and Commercial Bulletin* in its issue Monday, Sept. 13, says: Parties in a position to know confirm the reports of recent heavy sales of copper for export to France. It appears that representatives of the French Government and other foreigh consumers lately asked the Calumet & Hecla for prices on 20,000 tons. The Calumet concern named 11¾ cents as their lowest figure. Thereupon the Frenchmen bid 11¼ cents, which offer was promptly refused. After waiting a few days, the Calumet's terms were finally accepted. This sale is said to mean 11½ cents for ingot copper right away.

Our market is quoted as follows:

Ingot casting, jobbing	13 @—
Ingot " wholesale	12⅛@—
Sheet copper	— @16¼
Bolt	¼ and 5-16, 20c; ⅜ and larger, 16¼

LEAD.—The market has held to firm prices, although the East is reported easier; but this, it is thought, is only temporary.

Our market is quoted in jobbing lots as follows per 100 pounds:

Pig	5 00 @ 5 25
Sheet	6 25 @ 6 50
Pipe	5 50 @ 6 00

TIN.—The market is quiet but steady.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " " light, "	4 00@—

SHOT.—The market is firm.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs	$1 40
Drop, B and larger sizes, " "	1 65
Buck, Balls and Chilled, do, " "	1 65

POWDER.—The market is firm and very active.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17½c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

COAL.—The consumption is steadily increasing. Unless charters advance the shipments from Australia will fall away.

We quote as follows:

SPOT FROM YARD—PER TON.

Wellington	$8 00@— —
Greta	6 00@ 6 50
Nanaimo	6 50@ 7 00
Gilman	5 50@ 6 00

West Hartley	6 50

COKE.—The market is quoted as follows:

Gas Companies'	— — — —
English, to load	9 50 @ — —
" spot, in bulk	10 00 @ — —
" in sacks	11 00 @ 12 00
Cumberland	— — @ — —

IRON.—The market is steady to firm. The consumption is exceptionally large, with the outlook for 1898 promising quite an increase over 1897. At the East the markets are fairly steady with a veay heavy consumtion reported.

AMERICAN.

	To Arrive.	Spot.
Sloss	$20 00	$22 00
Thomas	21 00	22 00
Salisbury	29 00	31 50

ENGLISH.

Barrow	$21 00	$23 00
Gartsherrie	21 50	23 00

ANTIMONY.—The market is steady.

Our market is quoted at 8¼c in a jobbing way. New York mail advices quote 7¾c for Cookson's, 7¼c for Hallett's and 7c for Japanese.

NAILS.—The market is higher and strong.

Wire, carloads, basis per keg	
" jobbing, " "	$2 45
Cut, carloads, " "	
" jobbing, " "	2 35

BORAX.—The market is steady.

The market is quoted as follows:

Refined, in carload lots, in barrels	5
Refined, in carload lots in sacks	4¾
Powdered, in car lots	5
Concentrated, "	4½

PLATINUM.—The market is steady.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

ZINC.—The market is firm.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

Chemicals.

The general tone appears to be to firmer figures owing to a steady demand depleting stocks in second and third hands, which will cause them to come in before long as buyers. When this takes place they will, on nearly all lines, have to pay an advance owing to the increased duties.

SULPHURIC ACID.—The demand is fair. We quote in a jobbing way at 1½c per lb for 66%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported firm from store at 6½@7c per pound in carboys.

BLUE VITRIOL.—Our market is firmer.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is firm.

Our market is quoted in a jobbing way at $1.40 a pound.

BONEASH.—The demand is fair.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3¾c; No. 2, 2½c.

PHOSPHORUS.—The market is firm.

We quote in a jobbing way at 70 to 75 cents per pound.

SODA ASH, 58% (LeBlanc process).—The market is firm at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steady at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—There is a fair demand at 2½c a pound from stores.

NITRATE OF SODA.—The market is steady.

Our market is quoted from store at 4c for 95%.

Mining Share Market.

SAN FRANCISCO, Sept. 16, 1897.

The market has been fairly active throughout the week under review. The fluctuations were downward up to Monday, when a slightly steadier tone was noted in the afternoon, although not sufficiently pronounced to prevent margin selling and frightened holders from letting go Tuesday morning. After these had been cared for, the market began to appreciate, with Occidental, Sierra Nevada and Caledonia showing considerable strength, which brought about a strong closing for the entire line. The opening Wednesday was weak for all except Caledonia and Occidental. Towards noon the former sold at higher figures, which steadied the entire line. At the 2:30 session the market was steady, but after call everything sold off, except Caledonia, which sold up to 79 cents. The strength shown by Caledonia is no doubt due to the inside having secured about all the shares, and who, consequently, can commence work to show up the body of rich gold-bearing ore developed a few years ago. Assessments and keeping the shares down and inactive no doubt disgusted outside holders into selling. In three other other mines, whose shares are selling low, it is stated that good-sized bodies of ore can be shown up when the inside moneyed pool desire, although brokers', paid cappers' or tools' stock in trade is: "If only a body of ore can be struck." This has been the cry preceding every former deal, and will continue to be so long as Comstock shares are a gamble. The action of the market looks well, for keeping the heretofore leading shares down and advancing the low-priced is mystifying to the street, and causes a feeling of deeper disgust. This also admits of better concentration, particularly with a long line of assessments to collect and more to follow.

News from the Comstock mines through private sources considered reliable is hard to get, and the little reported is more or less conflicting, so that the main dependence is on official letters, which are always unsatisfactory, until the powers that be are ready to sell when the advices become too satisfactory, which cause outsiders to buy for the ore reported and insiders to sell at a good round profit.

From Con. Virginia they are working on the 1550-foot, 1650-foot and 1750-foot levels. On the latter level they report a streak of fair grade ore. No ore is being extracted. On the 1000-foot level of Ophir slow progress is being made in the west crossdrift. On the central tunnel level they are still drifting south. At last advices the quartz formation assayed $1 to $2 a ton. On the 1000-foot level the work is of a blocking-out character. It helps to kill time and also "kill off" outside shareholders. They continue to do dead work in Union on the 900-foot level. They are running the west crossdrift in Utah. Nothing new is reported from it. The news from Sierra Nevada is of a favorable character, yet it is not calculated to cause much enthusiasm. The work in this mine that is being closely watched by outsiders is on the Layton tunnel level. Bunches of fair to high grade ore are found. In Andes they are drifting north on the 175-foot level. The joint work by Best & Belcher and Gould & Curry is about the same as reported last week. From Savage nothing new comes to hand. The work is unchanged. Repairs are under way in Chollar in the west crossdrift, 450-foot level, and also in the station and main incline on the 1100-foot level. When shares are well concentrated then it is quite likely that important work will be inaugurated. From Potosi nothing new comes to hand from the levels heretofore reported. They are still "blocking out" in Alpha. From Con. Imperial, Confidence and Challenge nothing new comes to hand. They are still working ahead in the joint west crossdrift. From Yellow Jacket, Crown Point, Kentuck, Belcher and Seg. Belcher the news is about the same as heretofore reported by us. From Overman there is no change reported, while nothing comes to hand from Caledonia. In the Alta group the work is about the same as reported last week.

Brunswick lode advices speak rather encouragingly of the prospect on the 650-foot level of Occidental. The ore is wider and higher grade than on the 550-foot level. In Chollar they will soon make connection between the 500-foot and 600-foot levels, when the latter level will be opened up. There is a falling off in the number of tons of ore extracted from the upper levels. Active joint work by Best & Belcher and Gould & Curry is about the same as reported last week. From Savage nothing new comes to hand. The work is unchanged. Repairs are under way in Chollar in the west crossdrift, 450-foot level, and also in the station and main incline on the 1100-foot level. When shares are well concentrated then it is quite likely that important work will be inaugurated. From Potosi nothing new comes to hand from the levels heretofore reported. They are still "blocking out" in Alpha. From Con. Imperial, Confidence and Challenge nothing new comes to hand. They are still working ahead in the joint west crossdrift. From Yellow Jacket, Crown Point, Kentuck, Belcher and Seg. Belcher the news is about the same as heretofore reported by us. From Overman there is no change reported, while nothing comes to hand from Caledonia. In the Alta group the work is about the same as reported last week.

Brunswick lode advices speak rather encouragingly of the prospect on the 650-foot level of Occidental. The ore is wider and higher grade than on the 550-foot level. In Chollar they will soon make connection between the 500-foot and 600-foot levels, when the latter level will be opened up. There is a falling off in the number of tons of ore ex-

WE are exclusive handlers of Automatic Acetylene Gas Generators for Northern and Central California. We are desirous of establishing responsible agencies for our territory. Correspondence solicited. WESTERN ACETYLENE GAS CO., Room 75, 916 Market Street, San Francisco.

Working Capital for Mines.
PACIFIC EXPLORATION COMPANY
Will form companies and find capital to develop mines on shares or commission. Miners who have a good prospect should write the manager of this company for particulars. Address W. E. HOLBROOK, Manager, 29-30 Chronicle Building, S. F.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from N. B. Willits, et als., in the Willow Placer Extension, near Howard's Station, Sierra Co., to deposit tailings in Little Deer creek; from G. A. Rosenthal, et als., in the California Mine, near Sierra City, Sierra Co., to deposit tailings in east fork of North Fork of Yuba river; from Jacob Yager, in the Schneider Diggings, near Spanish Ranch, Plumas Co., to deposit tailings in Spanish creek; and from Henry A. Halisted, in the Halisted placer mine, near Spanish Ranch, Plumas Co., to deposit tailings in a ravine, gives notice that a meeting will be held at room 59, Flood building, San Francisco, Cal., on September 27, 1897, at 1:30 P. M.

Commercial Paragraphs.

GEO. E. TRUAX of Denver, Colo., has made arrangements with Geo. Woodbury of San Francisco for the local manufacture of his patent ore car.

THE Colorado Iron Works Company report the following shipments: One carload mining machinery to Kilton Ore Purchasing Co., Goldfield, Colo.; one 5-stamp mill, complete, to L. A. Martinez, Guaymas, Mexico; two special mining cars to Creston-Colorado Co., Torres, Mexico; one large elliptical bowl slag truck to Puget Sound Reduction Co., Everett, Wash.

THE General Gold Extraction Company of Denver, Colo., is building four reduction plants, which are expected to be in operation by October 1, 1897. They are located as follows: Poorman mill, Silver City, Idaho; Salmon River mill, near Salmon City, Idaho, and two near Breckenridge, Colo. They all adopt the treatment of the Pelatan-Clerici process.

THE Westinghouse Electric and Manufacturing Company has received from its European company notice of the award to it by the Metropolitan Electrical Supply Company of the contract for a large electric lighting plant to be installed in London. The apparatus will be of the multiphase type, involving the use of the Tesla patents. It is understood that the contract amounts to between $3,500,000 and $4,000,000. All of the electrical apparatus will be made at the works of the company in East Pittsburg, Pa.

THE Albany Lubricating Compound and Cup Company, 313 West street, New York, have many testimonials from users of their "Albany Grease." The following from Fraser & Chalmers, Chicago, is similar to many others. They say: "We beg to state that we have used both your compound and cups for many years, and have had a large account with you. We have never received a complaint from our friends scattered throughout the world, but when we have supplied our trade with your cups and compound once they always ask us for the same cups and compound when increasing their works or building a new plant. We hope you will meet with great success in the further introduction of your goods, and you may depend upon our patronage at all times." Tatum & Bowen, 34-36 Fremont street, are the San Francisco agents.

HEALD'S

BUSINESS COLLEGE.

24 Post Street, - - - San Francisco.

Has opened a Department of Civil and Mining Engineering, Chemistry, Metallurgy, Navigation, Mill Construction, Assaying, Blow-Pipe Analysis, Geology, Trigonometry, Geometry, etc., under the direction of Prof. O. H. Packer, an engineer of national reputation. Full information furnished on application.

The College has now Departments for Bookkeeping and Business Practice, Shorthand and Typing, Penmanship, Modern Languages, English Branches, Telegraphy, and Electrical Engineering.

Students can enter at any time. Pupils receive individual instruction. Twenty teachers. Moderate charges. Write for Catalogue and Journal.

Books Received.

"The Money Question." H. V. Poor, 44 Broad St., New York City; pp., 202; 8vo.; paper; price 50 cents. What Is Money? Function of Governments in the Matter of Metallic Money; Metallic Money of the United States; Symbolic Money—Banks of Issue; Savings Banks; Money by Law; Bank of the United States; Overthrow of the Bank and the Inflation of the Currency; Change of Standards—Acts of 1834 and 1837; Debasement of the Silver Currency—Act of 1853; Consequences Resulting from the Abandonment by the Government of Oversight of the Currency; United States Notes; United States Safety Fund Banking System; Gold Certificates; Demonetization of the Silver Dollar—Act of 1873; Remonetization of Silver; Act of 1890; Position of the Late Administration; The Sound Money Wing of the Democracy; The Free Coinage Democracy; Position of Present Administration; Bimetallism; The Remedy, etc., constitute the contents.

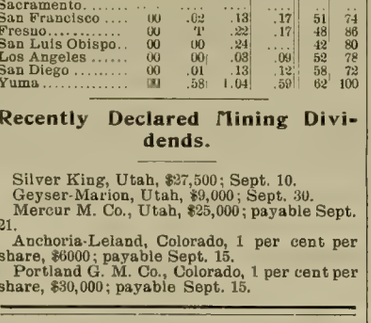
PATENTS



DEWEY, STRONG & CO'S

PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

Assessment Notices.

RED CAP MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Red Cap Creek Humboldt County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 25th day of August, 1897, an assessment (No. 1) of Nine Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, No. 125 Beale street, City and County of San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of October, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 23d day of October, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. deK. TOWNSEND, Secretary.

Office—125 Beale street, City and County of San Francisco, California.

SAVAGE MINING COMPANY. LOCATION OF principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees, held on the 2nd day of September, 1897, an assessment (No. 33), of 20 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, No. 309 Montgomery street, Room 50, Nevada Block, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of October, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of October, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

E. B. HOLMES, Secretary.

Office—No. 309 Montgomery street, Room 50, Nevada Block, San Francisco, California.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia City, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of September, 1897, an assessment (No. 44) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, rooms 20-22 Nevada block, 309 Montgomery street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 4th day of October, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of October, 1897, at 1 o'clock P. M., to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Rooms 20-22, Nevada block, 309 Montgomery street, San Francisco, California.

FAIRFAX VILLA COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fairfax, Marin County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 10th day of September, 1897, an assessment (No. 7) of Fifty Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 56, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of October, 1897, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the 8th day of November, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD, JR., Secretary.

Office—Room 56, No. 309 Montgomery street, San Francisco, California.

ALTA SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 3d day of September, 1897, an assessment (No. 57) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to Secretary, at the office of the company, room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of October, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 27th day of October, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. E. JACOBUS, Secretary.

Office—Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

ROPP STRAIGHT LINE FURNACE

FOR ROASTING, CHLORINATING AND DESULPHURIZING ORES.

Extracts from Letters Received from Mr. Philip Argall, Manager the Metallic Extraction Co., Cyanide, Colorado:

January 2, 1897.

"The roasting is invariably good. We can do 80 tons per day to 0.13% sulphur, when everything runs smooth. Our month record which, of course, includes all delays, is 1700 tons, from 1.94% sulphur to 0.16%."

February 19, 1897.

"Our furnace is now running very nicely indeed, averaging 90 tons per day to 0.10% sulphur, and doing excellent work; in fact, it has improved right along and we are highly pleased with it.

"For 24 hours ending 7 A. M. to-day 102 tons were roasted."

The ROPP FURNACE is now in successful operation at the following reduction works: The Hanauer Smelting Works, Salt Lake City, Utah (one furnace); The Metallic Extraction Co., Cyanide, Colo. (one furnace); The Colorado-Philadelphia Reduction Co., Colorado City, Colo. (three furnaces); The Selby Smelting & Lead Co., Selby, Cal; (one furnace); The Mount Morgan Gold Mining Co., Rockhampton, Queensland (one furnace); and Broken Hill Proprietary Co., Broken Hill, New South Wales (two furnaces).

MINING AND SCIENTIFIC PRESS.

AND PACIFIC ELECTRICAL REVIEW.

No. 1942.—VOLUME LXXV. Number 13. SAN FRANCISCO, SATURDAY, SEPTEMBER 25, 1897. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

PERHAPS no element of human progress exhibits more striking results than the one that is so familiarized by daily use as to be taken as an ordinary, matter-of-course affair, viz: the telegraph. Puck's "girdle round the earth in forty minutes" is daily duplicated. During the month the dailies here have had considerable telegraphic report of the outbreak among the mountain tribes in India, sent from Simla. At Simla a correspondent of the Reuters agency puts on the wire news of the fight between the tribes and British soldiers. From Simla it goes by land wire direct to Bombay on the Indian ocean; from Bombay it goes by cable to Aden at the entrance of the Red sea; at Aden it is relayed on another cable running the length of the Red sea, through to Port Said, at the mouth of the Suez canal; at Port Said there is another cable running to Alexandria, Egypt, and from Alexandria it can take one of several routes, either going across the Mediterranean sea to Athens, Greece, and then up through Italy, Switzerland and France to Havre and across the channel to London, or it could go the length of the Mediterranean sea from Alexandria, stopping at the island of Malta, then on to Gibraltar, then into Lisbon, Portugal, and from there under the ocean to Penzance, England, and by land wire from there to London. At London it is turned over to the Associated Press agent, who files it either with the Commercial Cable Company, or with the Western Union Cable Company, to New York. From New York it is put on the Associated Press leased wire for Cincinnati or Chicago, according to conditions, and from either one of these points it is relayed to Kansas City. From Kansas City another operator sends it to Denver, from which place it is sent through to San Francisco.

IN the issue of March 13, '97, appeared herein a copy of Assembly Bill No. 454, as passed by the Legislature, amending the act of April 23, 1880, for the further protection of stockholders in mining companies, the opening sentence of which was as follows: "It shall not be lawful for the directors of any mining corporation to sell, lease, mortgage, or otherwise dispose of the whole or any part of the mining ground owned or held by such corporation, nor to purchase or obtain in any way (except by location) any additional mining ground, unless such act be ratified by the holders of at least a majority stock of such corporation then outstanding." As recorded, and published in code form, in place of "a majority stock" appear the words two-thirds of the stock, a distinction hereby noted and corrected.

THE statement in last week's issue that "Where a mining claim is located in this State after November 2nd of this year, it will be possible to do the $50 worth of work required by the California statute and make it a part of the $100 assessment work specified in the Federal statutes," was an exact statement of fact. The new mining law of this State, which as yet has not been declared unconstitutional, says that $50 worth of work shall be done on a claim within sixty days after location. The Federal statute requires an annual amount of work or improvements to the extent of $100, the time for which such work begins being the 1st of January next after the date of location. Then, as stated, where a claim is located November 2nd, the locator has until the 31st of December, 1898, to comply with the requirements of the Federal statute; and as he has until January 1, 1898, to do the $50 worth of work required by the State statute, he can have such $50 in work or improvements apply on the $100 required by the national law.

AT the recent meeting of the Scientific Associatiation Lord Kelvin prophesied that in two generations Niagara Falls will have disappeared, the whole of the water being used for power purposes, which assumption is unlikely. He is not hopeful of long electrical power transmission, and is more in favor of bringing the manufactory to the source of power than taking the power to the manufactory. The success of the California long-distance transmission enterprises somewhat detracts from unqualified acceptance of Lord Kelvin's views on this point also.

Proper Placer Locations.

TO THE EDITOR:—Knowing that your paper is authority on all mining questions, will you kindly answer the following questions through your columns: A locates a placer claim on U. S. surveyed land in 1890, marks his location, and, regardless of the legal subdivisions of said land, marks out his claim where he thinks the channel runs. In doing so, he cuts through the quarter sections in a haphazard way, running hither and thither, marking a certain number of claims in a certain direction, a certain number in another direction—all regardless of legal subdivisions—and finally arrives at a point preceding his closing of the limits of his claim or location, leaving 2000 feet, more or less, undescribed in his location notice as carrying his location to the place of beginning. He performs the assessment work every year and records same as the law requires, pays the taxes on the claim, etc. He has not entered the claim for patent.

B comes in 1896, locates a placer claim adjoining A and includes in his location a portion of the territory included in A's location, claiming A's location to be null and void because of it not having been made to conform to legal subdivisions as nearly as practicable. B has his location surveyed and marked to conform to the legal subdivisions of the U. S. survey, records his claim, performs the location work, and in every way complies with the requirements of the Revised Statutes and the rules and regulations of the mining district wherein the claim is situated, and the State laws.

Which is the valid location, A's or B's? A prompt reply through the columns of your paper will be valuable information to many in this locality.

Fourth Crossing, Cal., Sept. 18th, '97.

In California the discoverer or locator of a placer claim must, among other things, post in a conspicuous place at the point of discovery a description of the claim by reference to legal subdivisions of sections, if the location is made in accordance with the public surveys; otherwise a description with reference to some natural object or permanent monument as will identify the claim.

It is not the province of this paper to authoritatively determine such questions, but from consideration of the matter as stated in our correspondent's letter it is apparent that in the strict construction of the Federal statutes A's claim is invalid. It is to be said, in connection with this, that the policy and purpose of the Land Department is to favor, as much as possible, the prior locator, and not to exact with technical rigidity all requirements. It may also be suggested that there are cases, where meandering beds of unnavigable streams ensue, that needless or impossible subdivisions are admissably disregarded. Probably were A to apply for patent, and there be no adverse argument, his application would be favorably acted upon by the Land Department. Of course, were there any opposition to such application, the matter would immediately become a question for determination by the courts; though, ordinarily, mutual concession and arbitration is in such cases preferable.

Recent State Legislation.

TO THE EDITOR:—Has the so-called Powers' Act of the last Legislature been tested in the courts? In one San Francisco paper I saw a statement to the effect that the Powers' Act had been before Judge Virdan's court, in Mono county, and that he had decided against the Act, declaring it unconstitutional. I have watched the papers closely since then, but have been unable to see another word about the matter; it seems strange that no other paper mentions the case. This law, abolishing mining districts and mining recorders, is a useless, uncalled for law; it entails a great deal of unnecessary trouble upon the miner. For instance, here we are, twenty-four miles from the county seat, and we must take all our location notices and proof of labor notices there, or send them for record, which, anyone can see, is costly and inconvenient; and if we want to see if a certain piece of ground is vacant, we must trot off to Placerville to ascertain.

Now, if this law has been declared unconstitutional, I want to know if we cannot go ahead and elect our mining recorders, just as though nothing had occurred? In conclusion, I will say that if this law should stand a test in the courts, it should be repealed by the next Legislature, as no miner wants it. I have never yet seen one who favors it.

Josephine, El Dorado Co., Cal., Sept. 17th, '97.

A great deal of space has been devoted by this paper to the subject referred to by our correspondent. In the issue of August 28th, 1897, the decision by Judge Virden of Mono county, Cal., was published. The subject is interesting and important to the mining industry in general. It may be said that some time before the last Legislature met, at the suggestion of a great many miners in different parts of the State, several bills were prepared by the MINING AND SCIENTIFIC PRESS, meant to apply to the actual present requirements of the mining industry, which, in the main, were endorsed at the November, 1896, convention of the Miners' Association. The gentlemen, however, who originated and championed the mining bills passed in the last Legislature, saw fit—which was doubtless their prerogative—to change a good many proposed forms of legislation; among others this one. While introduced by Mr. Powers, it cannot be said to be "Powers' bill," the honor of its formation being largely due to Mr. Soward of Plumas county.

The law that our correspondent refers to, while not satisfactory to miners, must for the present stand. It has few friends and is almost universally condemned. It may be said that in this, as in other regards, these matters are largely experimental and need revision at the hands of the next Legislature. This bill in particular has been the recipient of almost universal hostile criticism. Section 3 of the same bill (which provides that within sixty days from the date of the discovery of the vein or lode, or of the location of a placer claim, the locator must perform $50 worth of work in developing the property) has been also the subject of a great deal of adverse comment, some of our Sierra, Siskiyou and Shasta correspondents, pointing out that in some altitudes storms would prevent compliance with this law, and in general it is believed that an extension of time would be in the line of better protection all round.

As to the possibility of overturning the law in the courts, this paper is doubtful regarding the feasibility of such a proposition. Without assuming to be at all dictatorial in the matter, or speaking ex cathedra, it may be said that while local district rules govern and are binding, they are abrogated and set aside when State law takes charge, as in this instance. The only way, as it appears to us, that the new law could be upset would be by showing that it was not in consonance with the Federal mining law.

The law in question went into effect on May 26th, 1897. No records made on or after that date in any District Recorder's office in this State are valid. No District Recorder, under the law, could legally refuse to turn over his books to the County Recorder on or before June 26th, 1897. The County Recorder is the only lawful custodian of such books of record. Probably it would have been better had a little more attention been paid on the part of the miners themselves to what was going on in Sacramento last winter. The deficiencies of some of the laws which were passed were pointed out by this journal and urgent appeal was made to the miners to write and influence their representatives; that whatever legislation was effected would be to their interests. That such appeals were disregarded and such efforts not made appears in many quarters now to be a general subject of regret.

This is doubtless one of the questions that will come up before the convention, on the 18th of next month, of the California State Miners' Association. The last Legislature showed only a desire to pass any laws that the miners would agree upon for their own benefit, and whatever hardship is worked by the present law should be remedied by supplementary legislation at the next session; but, as we take it, the only thing that can be done at present is to comply with the law.

The communication above referred to is simply one of several similarly received. In answer to another set of communications regarding the same law and objecting to the provisions of Section 2, it is to be noted that in that section the provisions of the Federal law are omitted; and that, though omitted, they are of course not superseded by any State law and are just as binding as ever. Reference is made to the following:

SECTION 2324. All records of mining claims hereafter made shall contain the name or names of the locators, the date of location and such description of the claim or claims located by reference to some natural object or permanent monument as will identify the claim.

As to the right of the State to make such legislation as that in question, which abolishes the office of District Recorder, such right is absolute. It is believed that if there is any part of the law under discussion that may be held to be in conflict with the Federal law, it is that clause requiring that $50 worth of work must be done within sixty days after date of discovery. Regarding Judge Virden's decision, it is believed that, however just it may be, under the law, were it appealed, it would be reversed.

An Upward Move.

The announcement that the Bank of England is to keep one-fifth of its banking reserve in silver is authenticated, and is of some importance in connection with the future price of that metal. That proportion of the Bank of England's reserve amounts to $36,000,000, representing about 62,000,000 ounces at the present bullion value.

It would seem that a mistaken notion prevails as to the cause of this action, it being the generally accepted idea that the Bank of England has done this to relieve its need for gold as a reserve to the extent mentioned, and in many quarters opposed to silver this is used as a text upon which to argue the absurdity of such a movement. In this regard it is to be noted that the word "silver" means the British silver coin. Such coin is only available for redeeming Bank of England notes to the extent of ten dollars; but for general trade purposes a pound sterling in silver is as good as a pound sterling in gold.

It is believed that the real reason for such action as noted is a desire to arrest the downward movement of silver, so far as government silver and British colonial silver is concerned. The United States and France keep their silver dollars at par with gold by making them a full legal tender. The action of the Bank of England means just the same thing, and is caused by the present situation in India. Simultaneous with such action is noted an advance in the price of silver, not because of it, but in concert with it.

THE recent roster of California mines, their location, present condition, post office address of superintendent, etc., published by this paper, is of lessened present value, and its sale has been withdrawn. Such a list is necessarily transitory. While correct when compiled, the lapse of a year destroys much of its value, by reason of the migratory nature of many miners. About the first thing a miner does when he moves to a new base of operations, or the last thing just before moving is to write ordering a change of address of his MINING AND SCIENTIFIC PRESS. This paper goes to him in all his journeyings, but a State directory, however carefully prepared, ceases to be reliable after a short time for reason mentioned.

Concentrates.

LOS ANGELES men will put in a 50-ton cyanide plant at Mojave, Cal.

IN 1876 California quicksilver mines produced 72,716 flasks of 76½ pounds each.

AT Bisbee, Arizona, the Copper Queen Company pays 1150 employes $85,000 per month.

CALIFORNIA'S petroleum production in 1876 was 12,000 barrels; in 1895, 1,208,482 barrels.

THE Denver *Republican* is doing good work for the gold camps of the Centennial State.

REPORT is made of large deposits of mercury discovered on Noggriga creek, New South Wales.

THE Lyon county, Nevada, *Times* says there were 175 men at work on the Comstock last month.

A RECENT assay in San Francisco demonstrates the fact that some Ainsworth, B. C., ore carries gold.

SUPT. ENZENSPERGER will next March put a 20-stamp mill on the Norwegian mine, Tuolumne Co., Cal.

THE Northwest Mining Association will hold its third annual session at Spokane, Wash., Oct. 7, 8, 9.

NEWSPAPERS all over the country announce preparations everywhere for expeditions to the Klondike next spring.

EUREKA, WASH., is a busy mining town of 500 people, with neither a regularly established postoffice nor an officer of the law.

THE electrical power transmission plant at Portland, Or., was described at length and profusely illustrated in the issue of Nov. 16, '95.

NEVADA levies a tax on the "net output" of its mines. In Lincoln county the De Lamar mine thus pays nearly $50,000 tax per annum.

THE latest obtainable Pittsburg lead quotations are: Carload lots, 4.40c; smaller quantities, 4.55@4.65c; lead pipe, 6c; sheet lead, 6¼c.

THE force of the Austin, Nevada, mine is to be increased from 120 to 130 men. The mine is looking well and the new mill working satisfactorily.

GARLOCK, CAL., reports many prospecting outfits passing through daily, for Goler, El Paso, Black Mountain, Slate Range and Panamint districts.

THE act passed by Congress permitting the entry as placer ground of land valuable for petroleum or other mineral oils, went into effect February 11, 1897.

THE Evans-Van Heet Co., a Chicago corporation, is putting in a 10-stamp gold mill at Clifton, Arizona. A pumping plant is to be put in and fifty men employed.

DR. BECKER has come to the conclusion that the gold of the Rand, South Africa, has a marine placer origin, and is not the result of precipitation or of impregnation.

THE rise in silver from 51¼ to 56¾ has stopped most of the talk of shutting down the few silver-lead properties that are able to keep above water at the latter figure.

PLACER washings at Platina, in New South Wales, continues to carry platinum with the gold. The quantity saved during 1896 was 2900 ounces, valued at $19,575.

AS COMPARED with '94, the report of the U. S. Geological Survey shows an increase of gold production in California of 65,703 ounces during the following calendar year.

NO FIELD WORK is at present being done by the Cal. State Mining Bureau. Mr. Preston is assisting in the delineation of sundry maps in present process of preparation.

THE next convention of the California State Miners' Association will be held in Odd Fellows Hall, 7th and Market streets, San Francisco, beginning Monday, Oct. 18, '97.

ALEXANDER DEL MAR now comes forward with the statement that "The Mother Lode" is "an almost continuous line of hills filled with low-grade ore, stretching from Alaska to Patagonia."

IT was Commissioner of the General Land Office Lamoureaux who about a year ago decided that marble was not a mineral, omitting, however, to state whether it was an animal or a vegetable.

AN aperture 12 inches high by 12¾ inches wide, through a 1½-inch plank, with a head of 6 inches above the top of the opening, will discharge 200 miners' inches, each equal to 1.4994 cubic feet per minute.

LIBBY, MONTANA, which was called a lead camp a short time since, may soon be called a gold camp as well; several of the mines that were silver-lead properties near the surface are developing gold values.

THE *Republican* directs the attention of Arizona miners to the legal necessity of recording district clerks' bonds in the office of the territorial secretary, also of filing articles of incorporation with that official.

THE greatest distance at which long-distance telephone service is operated in this country is believed to be between Boston and St. Louis—1400 miles. The line just opened in this State is 904 miles in length.

INTERIOR California papers are still publishing advertisements of a San Francisco transportation company advising departure for "Coolgardie gold fields," where 300-ounce nuggets, "nearly all pure gold," are found.

ABOUT 2000 men have got over the Chilkoot pass and gone on to Dawson and the Klondike. The jam at Skaguay has been broken and it is thought that before Lake Bennett freezes 2000 prospectors with full outfits will have broken through the trail and started down the river.

AT the Cerro Colorado mill, Sonora, Mexico, the Mexican Gold and Silver Recovery Co. is treating 1000 tons monthly from the Cerro Colorado and El Tiro mines by direct cyaniding. The Colorado-Ures mill dry crushes 700 tons of ore per month, which are also treated by the cyanide process.

ABOUT this time of year a good many holders of mining locations are called upon to decide whether it is best to try to hold on to several locations or develop one at least to the extent of meriting a possible purchaser. Those who adopt the latter course will come out ahead in the long run—or the short run.

ALTHOUGH 733 more men were employed in gold mining in New South Wales in 1896, says the *Financial Times*, than in the previous year, the output showed a decrease of nearly a quarter of a million pounds in value, yielding about £51 13s 3d per man employed, which is much below what is considered a living wage.

THE production and export of copper for August, as compiled by John Stanton, shows: Produced by United States reporting mines, 16,309 tons; produced by outside sources (estimated), 1100 tons; produced by foreign reporting mines, 6963; making total production of 24,372 tons; experts were 10,971 tons.

IN Shoshone Co., Idaho, no matter what a patented mineral claim is worth, for the purposes of taxation it is valued at $5 per acre. Owners of mineral fractions say that the assessor assesses each patented claim at $100, telling the owners that if they have not a full claim of twenty acres it is their misfortune.

P. J. MCGUIRE, employed about the converters in the Anaconda, Montana, Company's smelter, tried to light a torch from an electric light. He was standing on an iron plate in wet shoes. Accidentally he touched the carbon and 6000 volts of electricity passed through him. He fell backward and in a few minutes expired.

THE Trail Creek, B. C., recorder's office shows that since Jan. 1st, '97, assessment work has been done on 1420 claims in the district. It is expected before the year is ended that the total number of claims on which assessment work will be done will reach 1600, representing an expenditure of $160,000—about 400 more than in '96.

THE lead handled in the Colorado smelters during 1896 was as follows: Arkansas Valley smelter, 23,999,702 pounds; Omaha and Grant, 11,276,898; Globe, 18,260,006; Philadelphia, 25,519,502; Pueblo, about 10,000,000; Colorado, 12,690,300; Union, about 2,000,000; Zinc-Lead, 1,228,300; Argentine, 60,138; total, 102,034,846 pounds.

THE Calumet & Hecla Mining Company's 104th dividend, of $10 per share, payable October 1, will make $40 thus far in the calendar year 1897, and carries the total payments of that company across the $50,000,000 mark, $50,850,000 being the total amount thus disbursed, it now being exceeded in this regard only by the Comstock, Nevada.

THE Banner mine, Nevada Co., Cal., is being reopened. It was located the same month in 1860 that this paper was started, and turned out hundreds of thousands. It is a noticeable fact that most of the biggest gold producers of California to-day are "old mines" that have been reopened. It is hoped that the Banner will prove no exception.

IT is thought that in '98 the Seven Devils district of Idaho will be a great copper camp. The Peacock, White Monument and two adjoining claims are leased and bonded to the New York Smelting and Refining Company for three years, the company paying a royalty of 20 per cent on all the ore extracted from the mines, with a purchasing privilege of $2,000,000.

THE Bannack, Montana, gold dredge cleaned up 150 ounces Aug. 25 and 50 ounces Aug. 26. Mr. Rollins writes: "If we ever arrive at that point of perfection where we can keep the boat going steadily without any breaks or interruptions, my candid opinion is that we can make it average $1000 a day during the season which it can run. The other or new boat cleaned up $2500 in July."

IN Inyo county, on the southeastern border of California, are the highest and lowest lands in the United States, and within fifty miles of each other—Mt. Whitney, 15,000 feet above sea level, and Death Valley, 480 feet below sea level. Whitney is the culmination of the southern Sierras; Death Valley, between the Panamint and Amaragosa ranges, the arid bed of an ancient lake.

THE report of the Colorado State Inspector of Mines gives the tonnage of ore extracted from the mines for the first six months of this year as almost double that for the same time in 1896, while in value he gives 26 per cent above that for the same time in 1896. This is accounted for by the larger amount of low-grade ore handled profitably. His report also shows that there are 5124 more men employed in the mines and that the wages remain practically the same per day per man.

THE Golden Cross mines at Hedges, San Diego Co., Cal., could escape paying taxes this year on personal property valued at about $100,000. The assessment was made to the trustees of the Golden Cross Mining and Milling Company and not to W. W. Stewart, at that time receiver. The statute requires that assessment of property shall be made to the receiver of a property when it is in his custody. The trustees, however, have notified the assessor that the taxes will be paid.

GOLD and silver are always to be weighed in Troy—12 ounces to the pound, 480 grains to the ounce. Gold is $20.671824 per ounce and $0.0430663 per grain. One grain gold button from an assay ton of ore, 437½ grains, one ounce avoirdupois, is $1.38712 for the ton of ore, 32,000 ounces and 32,000 grains of gold. One one-hundredth of one grain gold button from same assay ton is $13.7812 for the ton. One-tenth of one one-hundredth of one grain gold button from same assay is $1.37812 for the ton.

THE list of California mines, the name, character and location of mines, name and postoffice address of superintendent, etc., was published in this paper in the issues from April 25 to Sept. 12, '96, inclusive, and afterwards issued in pamphlet form. There were about 3600 names. The list was approximately correct at the time, but the addresses of superintendents, owners, etc., have changed some since the list was compiled. It was the first considerable effort of the kind in the history of the State.

THE mineral galena is a composition of lead and sulphur. The formula is PbS, lead and sulphur combined according to their atomic weights. The atomic weight of lead is 206.4; that of sulphur is 32. The following is the process to ascertain the percentage of each element: The atomic weight of lead is multiplied by 100 and the sum divided by 238.4, the total atomic weight of the two elements is the mineral. This will give the percentage of lead. The percentage of sulphur is obtained in the same way.

IN the Supreme Court of California this week in the case of Hamilton vs. Delhi Mining Company, on appeal, laborers' lien against mining property, the decision of the lower court was affirmed. The court held that where several claims or locations are owned and operated as one mine, as against the parties so uniting them, they may, for the purposes of the lien law, be regarded and treated as a single claim and declared on as such. Machinery and tools not erected upon nor used in the working or the development of a mine cannot be deemed affixed to the mine. They are in their nature "materials" furnished for use in the mine, for the value of which no lien attaches in favor of the material man, unless actually used in the mine or structure.

IN England there is apparently no seigniorage, but this appearance is deceptive. The mint will receive no deposits of bullion under £10,000. This drives all depositors to the bank. The latter sends the depositor to assayers and refiners, who, as a matter of fact, levy a very stiff but variable seigniorage on deposits of bullion, to which the bank adds ¼ of 1 per cent. The seigniorage at the British mints in India used to be 3 per cent on gold and 4 per cent on silver, then 2 per cent on each plus refining charge, then lowered to 1 per cent on gold and in 1893 abolished.

SO SATISFACTORY were the results of recent experimental tests of low grade ore for account of the Con. Cal. & Va. Co., Virginia City, Nevada, with the Kinkead mill, that the Gould & Curry are arranging for a test run of 1000 tons of the same grade. The test referred to is said to have produced a net profit of $2 per ton. As there is practically an unlimited supply there of such ore, the aggregate on a large scale would practically make all the difference between assessments and dividends all along the entire line.

NOTING a statement in the *Lumberman* that "the largest flume in the world is claimed for San Diego, Cal., and that its construction required 250,000 feet of lumber," E. Goughnour of Livingston, Montana, writes that journal: "I sawed lumber for a flume in the Black Hills of South Dakota that required over 4,000,000 feet in its construction. It was built for placer mining purposes and was 18 miles long, 42x48 inches in size, with 6x6 stringers under each side the entire length, sides and bottoms 1½-inch plank, side stays 5x5 inches, bottom same and top ties 3x4 inches."

THE *Cornish Post* says a new world's record in vertical shaft sinking by hand labor has been made at the Clement shaft of the Simmer and Jack, Limited, mine, Elansfontein. The shaft was sunk from 1390 feet to 1546 feet and 130 feet of timber and nine set of bearers put in during the month of July, thus beating the previous record (142 feet 6 inches) by 13 feet 6 inches for the same size shaft and same time (31 working days). The shaft is a five-compartment one, 15x8 feet outside and 25x6 feet inside the timbers. It gives credit to the manager, R. Robertson of California.

STATISTICS of the world's gold production of '96 are almost impossible to procure, three several sets having so far been issued, widely apart. As to California's gold product, the secretary of the Mint has discarded the regularly accepted official report and seems to depend upon carrier pigeons. From the best obtainable sources it is believed that the world's gold output for '96 aggregated $320,000,000; of this the United States contributed $53,000,000; Australia, $44,000,000; South Africa, $42,000,000; Russia, $32,000,000; Mexico, $6,000,000; British India, $6,000,000; China, $5,000,000.

THE Klondike excitement seems to have extended all over Europe as well as this country. Albion W. Tourgee, the well-known writer, who is now visiting at staid old Bordeaux, on the Garonne, writes: "The people in the middle walks of life are much interested in the Klondike gold fields. The impression seems to prevail that these fields are destined to be even more marvelous in their richness than those of California, Australia and South Africa. Men are looking for opportunities to invest in reliable companies, and I am deluged with inquiries in regard to a thousand things of which I know little, and a thousand more of which nobody knows anything."

NEXT year's Klondike travel will be large. The Canadian Pacific Railway Company has already undertaken surveys from Fort Wrangel, the mouth of the Stickeen river, 600 miles from Vancouver; thence by steamer up the Stickeen to Telegraph creek 175 miles; then by railroad to Lake Teslin 150 miles; by Lake Teslin, the Hootalinqua and the Yukon rivers to Dawson City by steamer 600 miles. An expedition is being made up in Chicago which will use the path traversed by the Hudson Bay Company for nearly a century; from Edmonton, N. W. T., by stage coach to Athabasca landing, thence via dog and cayuse along Mackenzie river to Fort McPherson, on the Peel river.

T. HUNTINGTON and F. Heberlein of Pertusola, Italy, have patented the following process: Lead sulphide ores are mixed with calcium oxide in proportion to the amount of sulphur present and heated to about 700° C. The mass, on being allowed to cool to about 500° C., decomposes, giving off oxygen, which attacks the lead, forming a mixture of oxide and sulphur, much heat being developed. If air is then blown into the mass, the reaction becomes continuous, and the heat is maintained sufficiently to ensure the reaction between sulphides and sulphates. At this stage sulphur dioxide is given off, and may be collected. The resulting mass of lead oxide and gangue is treated in the usual way.

REGARDING the entry of land for gravel pits and reservoir purposes, and granting right of way for pipe lines, a bill passed both houses of Congress in December, 1894, authorizing such entry and granting such right of way. Under this law any citizen of the United States, or ditch company, or water company, may buy lands for reservoir purposes not to exceed 160 acres of unoccupied land, at a price not less than $2 per acre. When the purchased lands are in a mining district they are not to be considered mineral lands, but the patents do not authorize the purchasers to extract mineral therefrom, reserving that right to the Government. Non-use of the land so purchased for two years constitutes forfeiture.

THE United States Circuit Court of Appeals has, in the case of the Tyler Mining Company vs. Sweeney, reported in 79 Federal Reporter, page 277, decided that when a vein of mineral-bearing rock, in its course lengthwise, after passing under the surface limits of one location, on which it crops, crosses nearly at right angles the side lines of another, prior location, on which it also outcrops, the side lines of such prior location becoming, by reason of the course of the vein, its end lines, the right to follow the lode in its downward course, between the vertical planes drawn through such end lines, belongs to such prior location, and the extra lateral rights of the other location cease when the vertical plane so drawn between the two locations is reached. The same court, in the case of the Republican Mining Company vs. the Tyler Mining Company, reported on page 733 of the same volume of the Federal Reporter, also finds that when a lode enters an end line of a regularly located mining claim, and runs its course lengthwise, nearly parallel with the side lines of the claim for the greater part of the length of the claim, the owners of the claim are not deprived of their extra lateral rights because the lode crosses a side line before reaching the other end line, but such rights will extend from the end at which the lode enters to the point at which it crosses the side line, whether a new end line is regarded as being drawn at that point or not.

Clear Creek County, Colorado.

Idaho Springs is situated in Clear Creek canyon, thirty-six miles west of Denver, and is on one of the numerous branches of the U. P., Denver & Gulf Railroad, which tap the mining sections of Colorado. This particular branch extends on up the canyon to Georgetown and Silver Plume, the three towns mentioned constituting the mining centers of Clear Creek county. From a point a few miles below Idaho Springs up to Silver Plume and Graymont, on the base of Gray's Peak, is a mining region which gives this county prominence among the mineral producers of the State. From the main canyon there diverges a score or more lesser gulches and canyons within the distance from Idaho Springs to Graymont. Thus, the erosions of nature have exposed the veins and fissures of this interesting region. In such side canyons as Gilson gulch, Virginia canyon, Chicago gulch, Spring gulch and Fall River canyon there are mines and mills which operate with varying results common to all mining camps. Clear creek and its numerous affluents make this a well-watered district. The most important branch is Fall river. In this we have the anomaly of a river running into a creek. But that should disturb no one, for a mining camp without misnomers and anomalies would be out of fashion. Clear creek flows from the perpetual snows and effervescent springs of Gray's Peak; Fall river drains the rocky defiles and pine-clad summits of Yankee hill. The constant washing of these little mountain streams over exposed ledges of ore accounts for the millions which have been taken from the sands of Clear creek, within the last thirty years, by hydraulic methods.

In the vicinities of Georgetown and Silver Plume the mine products are chiefly silver, and at present prices of that metal the mines of those places, while many of them are operating, are not specially prosperous as a whole. Around Idaho Springs, and within the district usually attributed to her, there is a more favorable proposition. Here the ores are generally a sulphide of iron and sulphide of copper, in whose values the gold predominates. Besides gold, the product contains, in many cases, considerable of copper and lead and varying percentages of silver. While a great deal of ore can be, and is being selected from the various mines of the district which may be classed as free milling, the district, as a general proposition, produces a smelting and concentrating ore. The mills here classed as stamp amalgamating mills all run concentrating tables in connection, and save from 30 to 60 per cent of the values in the concentrates.

Of the sixteen mills now operating in the district, at least twelve are purely concentrating or combination mills.

The Idaho Springs district proper is shipping about 2000 tons per month to the smelters, according to the figures furnished by the samplers. And, according to estimates furnished by the mill men, the mills are handling about 10,000 tons per month. A resume of the camp's output is as follows:

SMELTING ORE.

	Tons.
State Ore Sampling Co., per month	500
Dewey Bros.' sampler, per month	400 to 600
Chamberlain & Co. sampler, per month	900

MILL CAPACITY.

	Tons.
Silver Age mill, per month	900
Christianson & Wilkie, per month	700
Roberts-Jackson, per month	900
Anderson, per month	600
Mixsell, per month	900
Allen, per month	600
Stanley, per month	1,200
Lincoln, per month	900
Donaldson, per month	750
Standard, per month	1,500
Kinkaid, per month	450
Humboldt, per month	300
Mayflower, per month	1,200
Osborne, per month	300

The above is the capacity of the mills named when they are running full force; but several of them have thus far this year been operating only about one-half time. But it is safe to estimate that they aggregate about 10,000 tons per month. It is reasonable to estimate that the output will increase from now on.

The Stanley group ores are in sulphide form, but contain several varieties, including crystals of galena, copper pyrites and rubescite. The workings in the Stanley are very extensive and the mine and mill are well equipped with machinery.

The Lamartine, about nine miles above Idaho Springs, at the head of Trail creek, is one of the big producers of the district. It is developed by a tunnel 4600 feet long, which cuts the tenth level at a depth of 900 feet. This property is said to have produced over $3,000,000 in values. Its ores are a refractory, pyritic material, much of them running very high grade in gold, silver and lead.

The Standard group, on Fall river, five miles above Idaho Springs, is an old property, which was recently purchased by Messrs. Fredd, Bickford and others, who have built a concentrating mill at a cost of $30,000, and set the mine and mill to work at the rate of fifty tons per day. A tunnel is in 765 feet, with four drifts therefrom to the extent of 400 to 500 feet each, with numerous minor workings. Their high-grade ore is shipped to the smelters, the last shipment yielding $106 per ton. The mill dirt is said to run from $16 to $30 per ton. Thus the Stanley, Lamartine and Standard are mentioned as representative mines in their respective sections.

I now turn to the mines in Virginia canyon and those along the crest of the mountain which separates Clear Creek from Gilpin county. Among such are the Silver Age, Sun and Moon, Gardner, Gem and Gem Extension, Crown Point and Virginia, Hot Pot, Golden Cloud and Blue Bell.

The Blue Bell, belonging to Philip Mixsell, is in Virginia canyon, produces a milling and concentrating ore of an iron and copper sulphide nature, with rich streaks of lead in places. The chief values are in gold. From running 1000 tons of this ore a clean-up of $14,000 resulted.

The Gardner, at the head of Gibson gulch, on Seaton mountain, recently started up. The shaft to a depth of 350 feet is in sulphide ore, some of which has run as high as $100 per ton.

The Sun and Moon, in the same locality, is being developed from two shafts, which are 400 and 500 feet in depth. The values in this ore are saved in concentrates mainly and are principally gold, silver and lead, with the first named predominating.

The Crown Point and Virginia, well known as having been a large producer, is now working under a receivership. The work is progressing from an incline shaft 700 feet deep, from which ten levels have been run. The ore bodies are large, though rather low grade. The mine has produced as high as 480 tons per month, and is said to have produced $150,000 within the last three years. The ore is the same iron and copper sulphide as characterizes the ores from other mines in the vicinity and carries values in gold, silver and lead.

The Hot Pot is a concentrating proposition in the main, though some ores have been produced of a quartzite nature which were free milling.

The Golden Cloud, at the head of Virginia canyon, produces a characteristic ore, which yields gold and silver values in about the ratio of four to one. This is under lease and bond to the Imperial Mining and Leasing Company.

As a whole, the camp is producing enough lead to make a considerable item in the aggregate.

The Mayflower mine and mill have been sold, it is stated, to New York parties, but both remain under the management of W. R. Renshaw.

A pioneer mill man of the district states that he believes any well-regulated mill of the district is saving from 75 per cent to as high as 90 per cent of the assay values in the ores, which are about as refractory as those found in any district of the State.

M. E. Smith has moved his concentrating mill from Golden to Idaho Springs, and will soon have it operating at the latter place.

The accompanying illustration (see page 285) gives an excellent view of Idaho Springs, Colo., which is one of the neatest mining towns in the State.

Idaho Springs, Colo., Sept. 4, '97. WASCOTT.

Accidents in Mines.

Before a recent Australian Government Mine Commission, Alexander Stewart, general manager of the Broken Hill Proprietary mine, said:

"Of the accidents that have occurred, 60 per cent were due to the men or their mates, the result either of carelessness or of incompetence; 30 per cent were caused by circumstances over which the men only had control; and the remaining 10 per cent were of the non-preventive class. For the twelve months ending June 30, 1896, 24 men were discharged for drunkenness, and for the twelve months ending June 30, 1897, 34; for smoking underground the figures were 39 and 27; for lighting fires, 2 and *nil;* for leaving a charged hole in the face, 0 and 8; for leaving shoots or shaft uncovered, 0 and 4; for sleeping, 2 and 9; for quarreling, 2 and 2. This gave totals of 69 men discharged for the twelve months ending June 30, 1896, and 84 for the last twelve months for offenses that might have led to serious accidents. For incompetency in the same years 210 and 461 men had been discharged, and movements of the men were 2104 and 3138. These latter figures were not for individuals, however, as some men might have passed through the books several times. The amount of open-cut ore removed was 100,000 tons per annum; underground ore, 300,000 tons; open-cut waste, 400,000; filling in material, 150,000 tons; coke, 3500 tons per month; coal, 3000 tons per month; timber, 800 tons; flux, 7500 tons; bullion, 2200 tons; and slag, 22,000 tons. Taking those figures into account, the mine had no reason to be ashamed of the number of accidents that had occurred. The mine was paying £30,000 a month in wages, £4500 a month for stores, £3500 for timber, £11,000 for coke and £4500 for coal. Every month about five tons of high or nitro-glycerine explosives and nearly seven tons of low powders were handled—an average of between ten and twelve tons per month—and the accidents due to explosives were very low; in fact, lower than in any other part of the world, which was very creditable to the intelligence of the men of the Barrier. The number of men employed underground was 1000, in open cuts 350 and on the surface 1050. The figures related to the operations of the company on the hill only. The rate of fatal accidents in mines was 2 in 1000, which is considered very good, as a very favorable rate would be 3 in 1000."

The Broken Hill Proprietary Company handles practically 5000 tons of material per day, of which 4000 tons is dealt with at the mine.

Smelting in the Malay Tin Industry.

By far the greater portion of the smelting is performed in the immediate vicinity of the mines, where quite a number of very small smelting houses are erected. The Chinese smelter judges the ore by panning a small sample in a cocoanut shell, and purchases it accordingly, and, in spite of his aversion to modern ideas, takes care to obtain the latest quotations for the metal, which are telegraphed to nearly all the tin centers every day. The smelting is very simple in practice. Small cylindrical-shaped clay furnaces are used, bound together on the outside with hoop iron or cane. They vary from 3 to 6 feet in height, 2 to 3 feet in diameter; the smaller and more common ones are supported on a tripod, while the larger ones are sometimes enclosed in brickwork. The space inside the furnace is from 10 to 18 inches in diameter, open at the top, and narrowed down at the bottom to a tap-hole with the opening on one side, leaving a good thick bottom to the furnace. Diametrically opposite to the tap-hole, and some 6 or 8 inches above it, is another opening communicating with the exterior of the furnace, which serves to admit the tuyere. Below the tap-hole a cavity is scooped out of the ground, and serves as a "flote," into which the metal and slag constantly drip, and from which, when enough metal has collected, the tin is ladeled out into sand molds. The blast is obtained by means of a wooden air pump, the cylinder being made out of the trunk of a tree, and is set horizontally, the piston being moved backwards and forwards by a coolie. The smelting is started by throwing burning charcoal into the furnace, and, when fairly hot, adding alternate layers of damped ore and charcoal. As the tin and slag are produced, they gradually trickle through the tap-hole, and the charge is made up to its original level by the addition of fresh layers of ore and charcoal. The furnace is usually allowed to run twelve hours, and—according to the size of furnace and quality of the ore and charcoal—from half a ton to two tons of metal are obtained. The slag obtained is but little (in bulk), and usually collects around the tap-hole and flote. According to Prof. Louis, about 60 per cent of the tin is obtained from ore containing 68 per cent of the metal in this operation, and the charcoal consumed may vary from 30 to 100 per cent of the ore smelted. The slag contains from 5 to 7 per cent of tin in the form of prills, and from 8 to 10 per cent of silicate. When enough of it has collected, it is crushed by an arrangement resembling a prospector's dolly stamp, and panned. The prills are either run together in a kettle or added to the bulk of metal in the flote. The remaining slag is re-treated repeatedly, like ore in the same or similar furnaces, until it is considered sufficiently poor to throw away. Beyond skimming the ingots as they are poured, very little refining is done, and the metal is generally of sufficiently good quality to be put on the market direct. At Penang and Singapore, however, some of the merchants who export the metal have refining works, where the ingots are melted down again and re-cast.—American Manufacturer.

An Important Paragraph.

Section 22 of the new Dingley tariff law is a brief and harmless looking paragraph, but nothing in the whole bill has stirred up such a discussion in the United States since the passage of the act. It is as follows:

"SEC. 22. That a discriminating duty of 10 per cent ad valorem, in addition to the duties imposed by law, shall be levied, collected and paid on all goods, wares or merchandise which shall be imported in vessels not of the United States, or which being the production of or manufacture of any foreign country not contiguous to the United States, shall come into the United States from such contiguous country; but this discriminating duty shall not apply to goods, wares or merchandise which shall be imported in vessels not of the United States, entitled at the time of such importation by treaty or convention to be entered into the ports of the United States on payment of the same duties as shall then be payable on goods, wares and merchandise imported in vessels of the United States, nor to such foreign products or manufactures as shall be imported from such contiguous countries in the usual course of strictly retail trade."

It is a matter of considerable interest to the Pacific coast.

Reduction of Zinc Gold Slimes.

In the issue of August 7th appeared some notes on the reduction of zinc-gold slimes by E. H. Johnson. Herewith is appended a discussion of Mr. Johnson's article before a recent meeting of the Chemical and Metallurgical Society of South Africa:

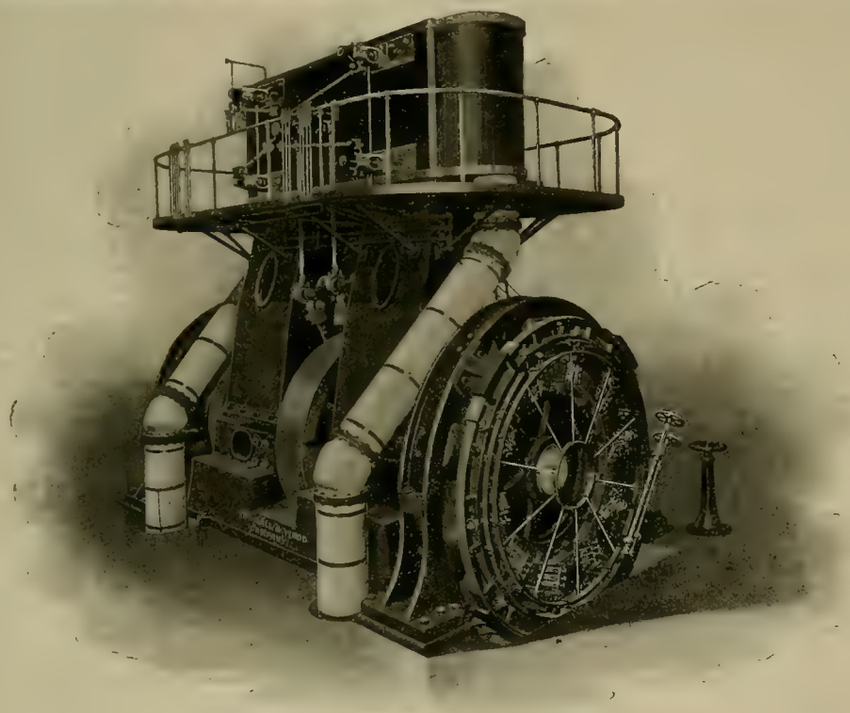
"I heard with very great interest Mr. Johnson's paper, and it seems to me a very important paper to have brought forward. The acid treatment of gold slimes is gradually replacing the niter method, because it gives finer bullion with less chance of loss from fumes. There is one thing which I saw mentioned some time ago: I think it was in the proceedings of the Institute of Mining and Metallurgy. Instead of sulphuric acid, acid sulphate of soda or potash ($NaHSO_4$ or $KHSO_4$) was used. It is cheaper, more easily transported and handled, and it performs its work most efficiently. I have experimented myself with this method, and I have obtained very satisfactory results on a working scale."

Mr. McBride said: It is with great pleasure I have read Mr. Johnson's paper on "The Reduction of Zinc Gold Slimes." Such a subject is one most useful to many members of this Society, and to Mr. Johnson is due our thanks for the interesting details he has given us of his work at the Princess. I agree with him when he says the methods of clean-up and reduction are varied on the Rand. This is due, I think, to the fact that the economical working of the process has never really been watched and advanced by the originators, and consequently the improvement of this department of the work has been left to the individual managers of cyanide plants. I touched on the importance of this work some months ago in the discussion on Mr. Yates' paper on "Zinc versus Electricity," and I am very pleased Mr. Johnson has brought the subject before us in this practical manner. It is of such importance in my estimation that I beg to be excused in reiterating and emphasizing his statements of the advantages to be derived in the sulphuric acid method of reduction and in giving a few details of his work at the Glencairn Gold Mining Company. By having proper appliances the risk of loss is reduced to zero. With regard to time, I am able to say that I have done an ordinary fortnightly clean-up from tailings from a 100-stamp mill and had the ingots in the safe at mid-day on the day after starting the clean-up. I differ from Mr. Johnson in his remark that "the cost of acid renders this method a little more expensive." Taking the clean-up costs of which Mr. Johnson has given us, I reckon that the additional fluxes, coke, crucibles and labor would bring the total cost of reducing and smelting the 504 pounds of dry slimes without acid treatment to over £25 sterling, instead of £19 9s 9d by the acid treatment; and in addition to this we have to consider the loss in selling a large bulk of slags and in the price obtained for low-grade bullion. With regard to the quantity of acid used, I have found three-quarters of a pound of acid enough for one pound of moist zinc-gold chips. This proportion usually leaves sufficient excess of acid to dissolve the zinc in the fine gold slimes, but I always examine it to make certain that the zinc has been reduced.

The quantity of zinc-gold chips and slimes naturally varies according to the strength of cyanide solution used, and consequently a greater or less amount of sulphuric acid is consumed. Some time since, when using 0.12 per cent KCy as my strongest solution, I got very good precipitation in the zinc boxes, but the gold did not go into slimes. It remained coated on the zinc. I washed the zinc over a screen with ¼-inch mesh; and, after treating the resultant chips, I got 10½ per cent of their weight in bullion of over 800 fine. The consumption of zinc at this time was only 0.16 pound per ton of tailings treated. When sufficient time is allowed for treatment, I advocate the use of weak cyanide solutions, as the little extra cost for acid is more than recouped by the saving in zinc alone, not to speak of the greater saving in cyanide. In arranging the different apparatus for the clean-up and subsequent reduction of slimes at the Glencairn, I have aimed at saving time both at the clean-up and reduction process, also at avoiding handling of the slimes as much as possible, and at minimizing any risk of loss in any department of the work. All the floors are cemented and graded towards gutters which lead to collecting wells. A 2-inch Cameron pump with suction hose delivers the supernatant solution from the extractor boxes to a settling vat placed above the level of the boxes. This solution is, after settling, returned to the extractors through a series of valves placed down the side of the vat. The compartments of the extractor boxes are connected by holes in the baffle boards or partitions. Plugs are withdrawn, and the slimes, being stirred with the remaining solution, gravitates to the bottom compartment, whence it is pumped to the filter-press vat. For this purpose I have fixed a 1½-inch hose to the suction pipe of the small filter-press pump, and I have provided a special delivery to the vat, where the slimes pass through a 900-mesh screen. In turn, the discolored solution only is pumped through the press, as I prefer to treat the zinc-gold slimes together with the chips with acid before putting it into the filter press. The corroded zinc is washed, and the chips collected in a small vat of similar dimensions to the press suction vat, viz., 5 feet 6 inches in diameter by 2 feet 6 inches in depth. The acid treatment vat is 6 feet 6 inches in diameter by 5 feet 6 inches in depth, and is provided with a revolving agitator, lid, fumes funnel and feed-box, very similar to Mr. Johnson's arrangement. It has also water and steam service led into it, and the waste solutions are decanted through a series of holes down the side of the vat into another vat of 10 feet diameter directly underneath it. This latter vat rests on a cement floor 2 feet 9 inches below the main floor of the extractor house; and the solutions, after prolonged settling, escape through an aperture in the foundation wall. I find this vat of great use in accelerating the final treatment, for it is not necessary that the gold should completely settle after each wash in the upper vat before starting to decant the water. I only put on two washes, or three if found necessary, before transferring the precipitate to the 900-mesh tray suspended in the filter-press vat. As the acid vat is above the level of this, the gold slimes gravitate through a pipe fixed to the bottom. A wooden plug, of course, protects this pipe from the acid during treatment. I have given a few details of my system of clean-up, as it is so intimately connected with the acid treatment as to be almost inseparable in a description of this kind. It will be observed that there is no handling of the slimes until they are taken from the filter press in hard cakes. These, again, do not require to be disturbed in the calcining furnace, and, as Mr. Johnson pointed out, loss in smelting is avoided owing to the absence of zinc. All gold-bearing solutions are allowed to stand sufficiently long to settle the precious metal before they are returned to the extractor boxes and thence to the storage sumps. I deprecate the system still adopted in some plants of bailing the solution from one compartment to another, as it is certain to dislodge some fine gold slime and deposit it in the storage sumps. With regard to the filter press, I am a very strong advocate of it, and I had great pleasure in visiting Mr. Johnson's plant some time since. Mr. Starr of the Consolidated Investment Company says he was thinking of patenting a press which he was adopting at the Buffelsdoorn. They put the slimes into a canvas bag and screw the neck of it, and thus you can get a very good filter out of a common bag. One of the great benefits of a filter press, I find, is that you can get through a large quantity of solution carrying a very small quantity of gold. What we call black solution at the clean-up, it puts through very rapidly, and it enables you to clean up with great speed.

Mr. Crosse: I quite agree with the former speaker as regards the very great importance of treating zinc precipitates in a thorough manner. I am very sorry Mr. Johnson in his very interesting paper did not give a few analyses of the various products. It would have been of very great interest and also of great value. I would have been most happy to have made the analyses for him, and I will do so at any time. I am not myself engaged in the process of treating gold slimes, but I have a great deal to do with cyanide gold. I believe as much passes through my hands as through any one's in Johannesburg. I notice in some cases bars are much more difficult to melt and obtain satisfactory assays than others, and this does not always depend on the fineness of the bars. Sometimes the bars go as high as 820 or 825 fine, and they are very unsatisfactory to melt and to assay. The only possible method to arrive at any conclusion of what is in these bars is by a careful analysis. The other day I made some rough tests. I found nickel and cobalt; sometimes there is iron and very often lead. Nickel, cobalt and lead are not removed by sulphuric acid. The nickel and other oxidizable metals are inclined to stick to the pot and should be eliminated in some way. We have made a very great improvement in the treatment of gold slimes, and I do not see why we should not go still further and turn out as good gold from zinc precipitates as from the battery process. Unfortunately, we do lose some gold; it is not always a case of driving gold up the chimney, but gold is lost; and, as Mr. Butters so ably pointed out, every grain of gold in zinc precipitates ought to be considered.

President Chas. Butters: I think Mr. McBride's criticism is almost a paper in itself, for which we have to thank him. There is one thing I might say in addition to Mr. Caldecott's remarks about the use of acid sulphate of potash in the cleaning up of zinc boxes. We have used, experimentally, something approximating twenty tons of this material, which is a by-product of the dynamite factory, for cleaning up and for making sulphate of iron, and we find it most effectual. I feel almost certain that sulphuric acid will be displaced and that this acid sulphate (containing 38 per cent of H_2SO_4) will be largely used here. It is a matter of information to the Society that such an article exists in the country.



450 H. P. VERTICAL ENGINE, COMPOUND CONDENSING, WITH TWO 100 K. W. DIRECT CONNECTED INCANDESCENT DYNAMOS—SPEED 180 R. P. M.

The Turkish Mining Industry.

Mining in Turkey is regulated by a law of August 26, 1887, which is administered by the ministry of agriculture, forestry and mining. To obtain a mining grant, application has to be made first to the governor of the respective province, stating what mineral it is intended to mine, on what scale and in what manner. The applicant must furnish a bond and proof that he is able to make good all damages that may be caused by his operations; the permit is then issued free of charge, that is for one year. Before its expiration, however, report must be made to the department of mining in Constantinople regarding results, accompanied by samples of the minerals found and an application for the prolongation of the concession. The application is announced in the official organ of the government, and, no protest being raised, the application is granted by a firman bearing the Sultan's signature. Now, an annual tax of about $1000 has to be paid. Concessions for mining chrome ore, emery, borate of lime, and meerschaum are issued for sixty years; for all other minerals, for ninety-nine years. Beside the license of $1000 there has to be paid a ground tax of 32 cents per hectar (2.47 acres) and a royalty of 5 per cent of the value of the mineral raised, the latter tax amounting to 10 per cent in the case of the minerals mentioned above.

From 1892 to 1896 concessions were granted as

follows: Five for mining argentiferous lead ore; one for silver, lead and antimony; one for antimony alone; four for chrome ore; one for emery; four for manganese ore; one for lignite, and two for borate of lime. The Anyhana copper mines, located at the headwaters of the Tigris river in Asia Minor, are operated by the State, but yield no revenue. The Turkish government also operates the silver-lead mines at Bulgarclagh, which yield 1500 kilograms of fine silver annually. The litharge, which is still highly argentiferous, is sold to foreign parties. The only coal mines of importance are found in the basin of the Heraclea, on the coast of the Black sea. The annual production aggregates about 150,000 tons, and is almost exclusively consumed by the Turkish navy. All other coal is imported from England, the imports in 1895 aggregating about 461,100 tons, of which 9500 tons were consumed by Constantinople. The best meerschaum diggings, too, namely those at Eskishehir, a station on the Angora railway, are owned by the government. These mines produced formerly about 8000 boxes (sixty-five pounds each) per year, but the production has declined to about one-half since the best pits have been flooded. The present production of asphaltum is insignificant, and hardly worth mentioning.

Of the mines operated by private parties, the most important ones are the lead-silver mines of Hodshah Gurnish, near Edremid, owned by a French company—the Societe des Mines de Balia-Kara-Aidin—producing about 4000 tons of ore annually, and the British Asia Minor Mining Company, whose mines at Lidshesi produce 3000 tons.

Turkey possesses a great wealth of chrome ore, enough to cover the requirements of the whole world. The annual production amounts to about 20,000 tons, the ore containing from 48 to 50 per cent of chrome. The entire export trade in this mineral is in the hands of a firm at Smyrna. The emery export is also controlled by a Smyrna house. There are still about 7000 tons of emery exported from Smyrna, but the trade is gradually declining, as the Smyrna emery is not able to compete with the emery from Naxos, which, although a monopoly of the Greek government, and of better quality, can be produced much cheaper than its Turkish rival. Borate of lime with from 40 to 60 per cent boric acid is produced by several companies, whose pits are located near Panderma. The annual production amounts to about 5000 to 7000 tons.

The production of salt is a State monopoly, and aggregates 231,000 tons, of which some 15,000 tons are exported. Drilling for petroleum, which was carried on at Alexandrette in Syria and other places, was unsuccessful.

Telluride in "Mustard Gold."

The following is from a paper read by Arthur G. Holroyd before the members of the Australian Institute Mining Engineers. Speaking of the recent finding of telluride of gold in Kalgoorlie, he says regarding "mustard gold:"

"This peculiar form of gold, resembling clay, was first brought under my notice in 1894, while acting as manager of the Austral Otis Metallurgical Works in South Melbourne. It came from the Hannans Star G. M. Co., and I was told it occurred in a vein varying in width from a pencil line to half an inch. Upon examining this clay-like gold under the microscope I found it consisted of the minutest particles, rounded globules, and filigreed, conglomerated together, resembling a sponge filling up similar shaped cavities and veins to those occupied by the telluride of gold in the sulphide ores. If this sponge gold is pressed with the blade of a knife (being exceedingly soft and malleable) its metallic luster is at once apparent. This mustard or clay-like gold can be artificially obtained in the laboratory by dissolving a piece of telluride of gold with sulphuric acid very slowly. The tellurium is leached out, and leaves the gold in an exactly similar form to that which is found in nature here upon this field. This, among other reasons, led me to conclude that the mustard gold in a mine here is an indication of the presence of telluride of gold at a depth. The greater quantity of the gold ores on the Kalgoorlie field carry mustard gold, and in most cases telluride of gold has already been found, in many cases very rich and in solid, hard country. I mention those mines in which I have already proved the presence of tellurium and those in which my experiments have proved to me that it will occur, and from the names mentioned it shows that telluride of gold is generally distributed throughout the field, and will be the eventual mainstay of the field.

"Another class of gold, 'sponge gold,' resembling mustard gold, but more spongy in appearance, having also a beautiful metallic luster, occurs upon this field. It resembles the most beautiful filigree work. This gold was found in large quantities in stoping from the 200 foot level to the 150 foot in the Great Boulder, and as much as seventy pounds of pure gold was obtained in one bunch of ore. This gold is also due to the oxidation of the tellurium, and at a depth large quantities of telluride of gold should be found. Under the microscope this gold presents the appearance of a mass of gold crystals (octohedron and dodecahedron), with brilliant faces and gold in filiform and arborescent shapes. There are evidently several other forms of tellurium besides calverite—sylvanite, krennerite and native tellurium are among the number."

Metallurgy of South Dakota Gold Fields.

At the Lake Superior July, '97, meeting of the American Institute of Mining Engineers, F. C. Smith, of Rapid City, S. D., read a paper on "The Potsdam Gold Ores of the Black Hills of South Dakota," in which he says:

"In describing a certain class of ores, of ever-increasing importance in the Black Hills, they are variously called 'refractory,' 'siliceous,' or 'Potsdam;' the first name serving to distinguish them from the other important class—the free milling ores; the second name being obviously applied on account of their mineral character, and the third name being taken from their more frequent geological habitat—the Potsdam series of the Cambrian. For various reasons I have used the latter name in heading this article, and have further classed these ores as gold ores, when, to speak strictly, it might be unadvisable to adopt a classification based upon either geological habitat or economic character; as a matter of fact, neither qualifying adjective is strictly correct in universal application to the ores in question, since they are, in certain cases, found in rocks later than the Potsdam, and in a few notable cases, are ores of silver. However, the above designation may be allowed to pass, since it will serve as a *quasi* distinction from the more general refractory and quartzose ores, and since these ores have been most largely mined in the Potsdam series, the further designation, as gold ores, may be allowable since, in the light of present knowledge, such are largely in the majority.

* * * * * * *

"From the first disastrous attempts at the treatment of the Potsdam ores, until more skillful experiment had firmly established the Deadwood and Delaware, and the Golden Reward plants, although considerable amounts of ore were shipped outside of the Black Hills for treatment, the fact that ores of less value than about $30 per ton could not be mined and shipped with any profit, together with a superstitious feeling that there was something 'uncanny' about these ores, and that they could not be treated successfully, prevented an active development of the Potsdam ore bodies. Only within the last three years have the old conditions been changed; and miners can now generally obtain a profit from ores carrying $15 per ton.

"Mining is not expensive; a large amount of it being carried on by means of tunnels, and the shafts being of relatively small depth. Little timbering is necessary, but water, in some cases, causes some annoyance; the ores are usually very hard and tough; and the eccentricity of the ore chutes, with local faulting, add to the expense of dead-work.

"Although many years ago the fire-assay of the Potsdam ores showed that they contained gold and silver in notable quantities, it seems to be the fact that until very lately no sufficient comprehensive chemical analyses were ever made to determine in what condition the precious metals existed. As already remarked, pyrite occurs plentiful in some of the blue ores; and doubtless that mineral was supposed to render them refractory; or, from the fact that only in very rare cases, and by the closest examination can any free gold be detected, it may have been supposed that the gold existed in particles too minute to be saved by ordinary processes. Screen analyses show that the precious metals are distributed throughout the ores with great uniformity, and chemical analyses of a large number of samples show that they are associated with tellurium. In addition to the early lack of metallurgical knowledge it would seem that too profuse litigation as well as the clashing of personal interests finally terminated the history of some of the early metallurgical plants, even after they had operated profitably, and greatly retarded the mining and metallurgical development of the Black Hills. Naming them in the order of their initiation, chlorination, matte smelting and cyanide lixiviation have (operating almost exclusively upon Potsdam ores) developed into remarkable industries in the Black Hills, particularly the first two. Chlorination, as exemplified at the Golden Reward and Kildonan mills, is carried on in the following manner: The ore is first put through the rock breakers, from which it passes to a drier; from the drier it passes into fine crushers, and thence to a series of crushing rolls, where it is crushed to eight or twelve mesh. It is next roasted in Howell-White continuous-discharge cylinders in the case of red ores, or in Bruckner cylinders in the case of blue ores. After roasting, the product is spread on cooling floors, from which it is elevated to bins to be discharged by hoppers into the chlorination barrels. The barrels are of iron, lead-lined, and have a capacity of about five tons. About four tons of ore are charged, along with about twelve pounds of bleaching powder, and from eighteen to twenty pounds of sulphuric acid per ton; the barrels are slowly revolved for about one and one-half hours, water being admitted under pressure after chlorination is complete, and leaching the chlorinated ore through a filter contained in the barrel. The gold-bearing solution is treated with hydro-sulphuric acid gas, and in some cases, after a preliminary treatment, with sulphurous acid to reduce chlorine. In this treatment, gold, along with various amounts of other metals, is precipitated; the solution is filtered through filter presses; the collected sulphides are dried, roasted in muffles, and smelted to bullion. Any silver contained in the ore chlorinated is, of course, lost, and a discrimination is usually made with reference to the ores treated by this process, whereby all ores carrying over three ounces of silver per ton are resereved for other treatment. At the Golden Reward mill a cyanide plant has been added for the treatment of this class of ores, making use of similar revolving barrels to those used in clorination. At the same mill additional roasting capacity has been secured by the erection of a Brown Horseshoe roasting furnace, which is said to give great satisfaction. The Golden Reward mill has a maximum capacity of about 150 tons per day of red ores, or about 100 tons per day of blue ores. The blue ores are roasted in Bruckner cylinders, while the red ores are in part treated in the Brown roaster, which has a capacity of sixty-five tons in twenty-four hours. The Kildonan mill has a capacity of about 100 tons per day, crushing to about eight mesh. Neither mill treats any custom ores, but each operates exclusively upon the product of its own mines.

"While the efficiency of these mills is satistory to their owners, their saving in precious metals is not so good as might be desired or as will be obtained in the future. Finer crushing would undoubtedly insure a better extraction, but would also add to the expense as well as interfere with filtration. It is to be supposed that those operating these mills have experimented along various possible lines with a view to secure the most economic method for the treatment of these ores, both with respect to a better saving of gold and the saving at least a part of the silver; it is also to be supposed that, with the present arrangement of the respective plants, they are producing relatively good results. The Golden Reward has trebled in its initial capacity, while that of the Kildonan has been nearly doubled during its existence of about one year.

"From various points of view the Deadwood and Delaware Smelting works constitute the most important metallurgical industry in the Black Hills, and its existence is of special value from the fact that it furnishes the only local market for Potsdam ores. Commencing in a comparatively small way, in its life of about seven years it has developed a daily capacity of about 400 tons, of which about 180 tons are Potsdam ores. The process, as developed by Dr. Carpenter, is one of matte concentration, wherein the blast furnaces are charged with the following burden:

	Tons.
Siliceous ore	180
Copper ore	60
Pyrite	100
Limestone	180

"This mixture is smelted with from 10 to 12 per cent by weight of Eastern coke or about 16 per cent of Newcastle coke. Slags carrying ten to twenty cents per ton in gold, 0.2 to 0.4 ounces of silver per ton and traces only of copper, are separated in the fore-hearth, and a matte is formed carrying all of the gold and 90 per cent of the silver, as calculated from the assays of the ores charged, and constituting about 5 per cent by weight of the original charge. The magnesian limestone is obtained from the Carboniferous outcrop, but a short distance from the smelter, at a cost of fifty cents per ton; the pyrite is obtained in the form of concentrates from the Homestake mine; copper ores are brought from Montana and are added according to the supply, the charge containing from 2 to 10 per cent of copper, with a probable average of about 5 per cent.

"Matte smelting, under the special form used in the plant just mentioned, indicates a great advance in metallurgical progress; as compared with the other processes mentioned, the saving of the precious matals by this process is much better. Compared with lead smelting, for which either lead or copper must be brought in from beyond the hills, its efficiency is much greater, owing to the highly siliceous charges possible. In lead smelting slags are calculated having an extreme upper limit in silica of about 37 per cent, while at the Deadwood and Delaware works the ordinary slag carries about 52 per cent of silica. The charge for treatment of Potsdam ores at these works is $10 per ton, allowing 95 per cent of the gold and paying for 90 per cent of the siver over one ounce per ton.

"The figures given above, indicating a daily treatment of 520 tons of material, represent the capacity of three blast furnaces. The plant consists of five, of which three are continuously in blast. There are also two reverberatory furnaces for the preliminary treatment or slag roasting of fine ores and concentrates.

"The cyanide process is represented in the Black Hills by the plant of the Black Hills Gold and Extraction Company at Deadwood, which has a capacity of

about thirty tons per day, but which has not been constantly in operation. In this plant, which seems to be rather badly arranged, only red or oxidized Potsdam ores are treated, being fed to the crushers along with sufficient lime to counteract the acidity; thence the ore goes to the drier, then through another crusher and three sets of rolls, with the intention of crushing to thirty mesh. The crushed ore is leached in tanks in the ordinary manner, the tailings being removed by hand and reserved for future treatment. The gold is precipitated from the solution by zinc shavings, and the handling of the precipitate does not differ from the usual practice.

"The tonnage of Potsdam ores treated is being constantly increased, and the area in which these ores are mined is ever extending. The recent discovery of pay ore at Ragged Top has caused a typical mining "boom," and will result in the development of a section of country in which, heretofore, little has been done in the way of mining. The smelter, with a view both to the treatment of the product of its own mines, and to increased custom work, is continually enlarging its capacity; and this is also true, to a lesser degree, of the chlorination mills. The following may be considered a conservative estimate of the tonnage of Potsdam ores treated during the year 1896:

	Tons.
D. & D. Smelting Co.	65,700
Golden Reward Co. (Chlorination)	39,000
Kildonan Milling Co. (Chlorination)	36,000
Black Hills G. & E. Co. (Cyanide)	6,500
Shipped outside, about	4,800
Total	152,000

"In consideration of the northern connected district but little mention has been made of the more or less disconnected areas of Potsdam ores in the neighborhood of Lead City and Deadwood, yet there are many valuable producing mines among them, and large tracts are yet undeveloped; the ores are similar to those already described."

Economical Paint.

The methods adopted by painters to reduce the cost to them of materials are many, but the most simple one, and one used on almost any job, is the adulteration of their paint with soft soap. Any color, from the yellow ocher to carmine, may be augmented by mixing with it common soft soap. For common work they mix the paint as ordinarily; that is, with oil, turpentine, and japan; then to a quart of the paint add one pint of the soft soap, and stirring it thoroughly the paint spreads under the brush; and as it is difficult to immediately discover any defect, the apparent expense of painting such work is reduced to nearly one-half. The soap assimilates with the oils of the paint, and is sometimes added by the contractor or boss without the knowledge of the workman.

Another means of cheaping paint is in the use of kerosene oil. Often a common job is painted with paint mixed with japan or furniture varnish as a binding material, and thinned to a working consistency with common kerosene oil. It seems to answer as well as turpentine in the working of the paint, and dries equally as well, the only bad feature being its smell. However, the difference between sixty cents a gallon for turpentine, and twelve cents a gallon for kerosene will give relief for the deficiency. Benzine was once used almost exclusively for a paint vehicle, owing to the scarcity of the turpentine, but as quickly as turpentine became a marketable product the benzine was thrown out, principally owing to its odor, yet it is used to some extent on house work. Crude petroleum is frequently employed for mixing paint for barns and common outbuildings, and for roofs it answers a very good purpose. The roofs of most buildings in California, where the long dry season from May to October occurs, are painted, and generally with Venetian red mixed with petroleum. This, too, is often adulterated with soap.

To paint a building cheaply take whiting, for three cents a pound, mix it with kerosene or crude petroleum to a paintlike consistency, then add Venetian red to form a light red or pink, the whiting having very little coloring power, but making bulk, or add yellow ocher to form a yellowish clay color, the ocher being fully as inexpensive as the Venetian red; then put into the mixture some cheap furniture varnish say, a pint to a gallon of mixed paint, the varnish costing about $1 per gallon. This gives the binding or adhesive property. Other cheap pigments may be used where other colors are desired, using the whiting to form the bulk of the paint. Lampblack in a very small quantity will make a lead or slate color. Burnt sienna added to the whiting mixture will form a salmon color, and thus a variety of tints or colors may be made. For fences and like work there is a still cheaper paint, and of more value as a preservative of the wood than lime whitewash. Take the common road dust, pass it through a sieve to remove stones and coarse particles. Mix it with petroleum or kerosene, as before mentioned; then add some cheap pigment to color it, the road dust forming the bulk of the paint. This paint may have a goodly share of soft soap mixed with it without detriment, and it will be found to spread much easier under the brush. If a more durable piece of work is desired than those above mentioned, white lead and linseed oil are given the place of whiting, road dust and petroleum, but what has been said above is for those who wish to improve the appearance of their belongings at a very small cost, and at the same time make a fairly durable job.

A Negative Opinion.

The Klondike placers are believed by many to indicate an even larger probability of gold wealth in quartz ledges. Upon the existence of such probable quartz mines largely depends the permanence of that region as a gold producer.

On this subject Ross E. Browne, of San Francisco, holds a different opinion from several arguments recently advanced, and, in the *Chronicle*, says:

"It is a well established fact that our placer gold is derived from quartz veins by the natural processess of erosion, disintegration, transportation and assortment by running water. The transportation of the rock fragments may be either by glaciers or by running water, but the assortment and concentration of the gold is necessarily due to running water only, and concentration is always essential to make a valuable placer. It sometimes happens that the transportation is mainly by glaciers forming lateral and terminal moraines of unassorted materials. These are subsequently washed by running water which rounds and assorts the bowlders and pebbles, concentrates the coarse gold and ultimately forms the placers. The gold particles occurring in the quartz veins, though most commonly minute, are often coarse enough to be conspicuous to the naked eye, and sometimes large enough to weigh several ounces. It is this coarse gold which accumulates in the placers by natural concentration. The minute particles are scattered in the main masses of gravel and sand and are carried off by the current.

"The quartz veins, therefore, to produce valuable placers, must contain coarse gold. So-called pocket veins and seam deposits are especially favorable. These need not contain gold enough to pay the great expense of quartz mining in order to produce rich placers. The product of a single placer claim often represents the natural concentration from millions of tons of material derived from quartz veins and seam deposits. The whole mass of original material might not average more than a small fraction of a dollar a ton, and yet produce a valuable result in placer concentration. Our notably productivequartz mining districts are characterized by veins containing large continuous shoots of ore with the gold finely disseminated, associated with sulphurets, et The product from these is mainly in gold particles too small to collect and become available in the placer concentrations. Take, for example, the Nevada City and Grass Valley district, and the mother lode districts of Amador, Calaveras and neighboring counties. These are our most productive quartz-mining sections, but have not been the feeders to our most important placers. There are isolated cases in these districts where rich placers of limited extent have resulted from the disintegration of paying quartz veins, but in this statement the matter is regarded in too general a way to take note of detail.

"In California's great placer districts their value has not been derived from correspondingly valuable quartz veins. The most important of them appear to be derived from veins hopelessly poor from a quartz-mining standpoint. Take, for example, the gravel deposits of Placer county draining into the forks of the American river, which have produced about $100,000,000. Important discoveries in the quartz veins of that section are notably scarce, though the county is seamed with veins. The important placer sections of Nevada county are not connected with the more permanently valuable quartz-mining sections. The same might be said, in a general way, of Sierra county, though perhaps with less force. The great Plumas county gravel district, with its large yield, has disclosed no corresponding values in its quartz mines. The same may be said of the Butte county placer district. The Cariboo placers of British Columbia have yielded $60,000,000 or $70,000,000, and, so far as explored during thirty odd years, no valuable quartz mines have ever been found. It may be said, further, that in our Central California placers the coarse gold, once liberated from the quartz, has not, as a rule, been transported very far. We often hear vague theories about the distant sources of our gold nuggets. As a rule such theories are based upon a misconception. Coarse gold may be carried long distances by glaciers, but not by running water on ordinary slopes.

"It may be said in a general way that while it is well known that many of California's important quartz veins were originally discovered by following up small gulch placers tailing out from them the attempts to discover valuable quartz veins by following up our most important placers has generally proved futile. Quartz mines should always be looked for, however, and in the case of a rich find as the Klondike it might well be that the placers are partly derived from profitable pocket veins and seam deposits. They should generally be looked for near at hand, unless there is very special evidence of the gravel having been derived by glacial transportation from distant sources. It should, however, be borne in mind that the concentrations in such placers are the aggregate results of the degradation and disintegration by natural processes and without expense to the miner of millions and millions of tons of material. The placer product obtained in a few years could not have been obtained by mining the veins from which it was derived for a whole century. The gold product of the world has been mainly from placers. California's placer product during the first four or five years of activity exceeded its total quartz mining product in forty-five years, and of the total gold product of our State probably four-fifths were taken from the placers. The South African Reefs, to be sure, are yielding a great product right along, but it is by no means certain that these are veins. In fact, it is now asserted and by excellent authority, that these reefs are nothing more than ancient shallow placers interstratified with the sandstone and quartzite sheets, and tilted into positions that give them a vein-like appearance.

"It is of course possible that this rich Klondike find may lead to the discovery of quartz veins carrying greater percentages of coarse gold than we are accustomed to encounter, but so far the prediction of a correspondingly great discovery in quartz veins does not seem to be warranted by the histories of similar finds in the past."

Anaconda Copper Mining Company.

The profit and loss account of the Anaconda Copper Mining Company for the year ended June 30, 1897, shows:

Receipts by Sales.	*1897.*	*1896.*
Copper	$13,003,955	$8,578,177
Silver	3,081,552	3,055,184
Gold	382,259	296,542
Total	$17,267,766	$11,929,903
Royalties, etc.	151,595	127,774
Copper, silver and gold on hand	5,521,032	4,888,020
Total receipts	$22,940,393	$16,945,697
Deductions—		
Value of matter on hand	$4,888,320	$748,294
Mining—all expenses	5,726,009	5,071,677
Reduction works	5,812,518	5,616,517
Total	$16,426,538	$11,436,488
Operation subsidiary departments	556,505	829,485
Balance	$15,879,033	$10,607,003
Freights	681,692	586,922
Refining charges	1,058,825	1,248,214
Interest on advances	116,116	135,974
General expenses at New York & Anaconda	$17,804,345	$12,687,182
Profit	$5,136,048	$4,258 515
Dividends	3,000,000	750,000
Surplus	$2,136,048	$3,508,515

President J. B. Haggin in the report says:

During the year 132,364,198 pounds of fine copper were shipped from Anaconda in the form of electrolytic cathodes and converter bars; the shipments of silver, either in bullion or converter bars, amounted to about 6,200,000 fine ounces and of gold 20,380 fine ounces. The sales in same period amounted to 120,864,097 pounds of fine copper, 6,057,067 ounces of fine silver, and 18,511 ounces of the fine gold. The stocks of copper, silver and gold on hand June 30, 1897, have been valued at $5,521,031. The copper at Anaconda has been taken at cost of production, while that shipped was valued at current prices of June 30, 1897, the present quotations being about the same. The silver on hand has been valued at 52 cents per fine ounce, except that since sold. The shipments from Anaconda during the month of June were much above the average product, which accounts for the increase of stocks on hand June 30, 1897, compared with those of June 30, 1896.

The costs at the mines and reduction works amounted to $11,538,517, less profits of $556,505 from the subsidiary departments, leaving a net expenditure of $10,982,012 in Montana. The expenditure for entirely new plant, all of which has been charged to operation, amounted to $606,843, and, as the property throughout has been kept in the highest state of efficiency, the trustees are of the opinion that no charge for depreciation of plant should be made in the accounts.

The profit and loss account of the year shows a credit balance of $5,136,048. Of this, $166,639 was absorbed in fresh capital charges, leaving a liquid gain of $4,969,408. On June 30, 1897, the indebtedness of the company for advances, less cash resources on hand, was about $700,000, showing a decrease of about $1,500,000 compared with June 30, 1896; dividends of $3,000,000 were paid during the year; these two sums, together with large stocks of metals on hand on June 30, 1897, practically account for the profit for the year.

Should the operations of the present year, 1897–8, result in profits approaching those of 1896–7, the company will before long have ample working capital in hand, and the trustees would then be in a position to deal with the surplus remaining after the payment of the regular dividend.

The price of silver has in the past few months fallen greatly, thus reducing considerably the profits of the past year, and promising to still further reduce the profits of the present year, 1897–8. Against this, the costs of refining will be considerably smaller for 1897–8, and the superintendent is hopeful that costs in other respects will also be diminished.

The output of the Anaconda in 1895 was: Copper, 99,775,294 pounds fine; silver, 5,470,860 ounces; gold, 20,229 ounces. The output in 1896 was as follows: Copper, 125,350,693 pounds fine; silver, 5,433,876 ounces; gold, 17,411 ounces.

Scientific Progress.

Newspaper Science.

The *Literary Digest* deals "Newspaper Science" a sharp rap in the statement that, while Tesla has made some remarkable discoveries, and in his proposed wireless telegraphy has entered a realm of wonder, the manner in which his claims have been presented by many newspapers with sensational fancyings and exaggerated statements of what such achievement means, has made Tesla appear ridiculous and his scheme absurd.

As the *Record-Union* says, there can be no doubt of that. The trouble is that the sensational press is not content with recording the cold facts of discovery and the exact claims of scientists, but invariably attempts to adorn a tale and garnish an achievement with the ornaments of fancy, born of the speculation of writers who hold to the doctrine that nothing is worth printing that will not stand sensational headlines and padding by the imaginings of men who are not scientists, and who are paid only for that which in print reads sensationally.

The *Electrical World* has its shaft aimed at this same order of journalism and wittily says: "These papers have indulged in spasms of large type and staring headlines concerning the remarkable labors of an inventor who, some may begin to think, prefers such mediums for his communications to the scientific world." It is stated upon the authority of the New York *Herald*, under a caption 10 inches high, that Nikola Tesla is about to discharge upon the suffering world an electrical disturbance which, in the language of our esteemed contemporary, "travels on the alternating currents with which the earth and air are charged, at the rate of several million miles a second." It is also stated that "the disturbance from the machine is felt instantly all over the globe."

While we are not told whether the feeling accompanying the disturbance is pleasant or otherwise, it is to be inferred from the lurid language in which these remarkable results are made public that the cataclysmic forces of nature are to be unchained and go careering through the realms of the air at the will of the inventor. The solid earth is to be shaken to its foundations, and the very atoms of its rocky frame are to be jolted and jarred by the tremendous vibrations emanating from his laboratory. There should be some limit set to this sort of thing. A new danger lurks in the electrical charge of the earth. From time immemorial the old planet has gone along carrying its charge of electricity undisturbed, except by such minor manifestations as thunder storms and the like, but now all this is to be changed. The placid quiescence of the earth's charge is not pleasing to Mr. Tesla. He wants to shake it. He proposes to send his vibrations careering through the very frame of the globe. The long repose of its electrical charge is to be rudely disturbed.

This does not seem right. A solemn warning should be givin to all experimenters who propose to do those revolutionary things. If any disturbance is to be created which will be instantly felt over the globe, it seems at least reasonable to enjoin the disturber until proper assurances are given that the nature of the feelings to which we are to be subjected is pleasant. * * * Lest some one should make the mistake of taking this too seriously, it seems necessary to say that Mr. Tesla is probably more amused by the newspaper accounts of his work than any one else.

There is a great deal of this sort of thing in the flash journals of the day, papers claiming to be leaders among the public. We can name three that come to our desk daily that at least once a week indulge in the most ridiculous and outrageous illustrations of alleged discoveries, scientific achievements, or astounding revelations in natural history. Sometimes these pictures are absolutely startling in their character, and the text accompanying is monstrously exaggerated and ridiculous.

There would not be so much to concern oneself about in this, but for the unhappy fact that they do infinite injury, since, unfortunately a great body of readers take these fairy tales and lurid accounts to be truth. They form, therefore, wholly incorrect ideas and entertain harmful notions concerning progress, discovery and scientific research.

If the newspaper press wishes to serve its clientage well and to its benefit, it will perform the office best by setting forth the claims of scientific workers, experimentalists and students of natural history precisely as made, and without attempts to embellish, or indulgence in any speculation as to possible results. Such a policy will prevent misconception, invite to honest inquiry and cultivate love and respect for scientific truth. The plan now pursued, however, by the lurid press is opposed to all reason, stocks the reader's mind with harmful notions of what is to be expected, and unfits it for the reception of the truth in practice.

Boring for Steam.

The deepest well in the world will soon be completed near Pittsburg, Pa. It is now more than one mile deep, and when it is finished it is expected to reach two miles down into the earth. It is being bored in the interest of science. The object in penetrating so deeply is to determine just what the interior of the human footstool is like. From a commercial point of view the well was a success long ago. A comparatively few feet below the surface both gas and oil were struck in paying quantities, but the company owning the plant determined to dedicate it to science, and invited Prof. William Hallock of Columbia College to carry on a series of temperature investigations as the hole is carried deeper and deeper into the earth. The result of these investigations is interesting, and it is the opinion of several scientists that the ultimate result of the boring will prove to be of economic as well as of scientific value. It is the intention of the company to continue the boring process until something entirely new and original is developed. This may seem a crude way of putting the statement, but it has long been a theory among well men that if it is possible to go deep enough some new geologic condition or economic feature would be found to exist. At the very lead they claim natural steam would be encountered, or the well walls would finally become so hot that water could be pumped down cold and pumped up in the form of steam, and thus the natural power of the future be obtained. There is material for much speculation, and the interest becomes greater in increased ratio as the drill descends. One remarkable feature of the well is that the gas found near the surface is now used to operate the engines which do the drilling. Thus the natural power already issuing from the well is utilized for the purpose of deepening it.

Professor Hallock estimates that at 10,000 feet—the proposed depth of the well—the temperature will be 228 degrees. As at a temperature of 212 degrees water is converted into vapor, he expects that his well will afford an ample supply of natural steam that will prove to be the cheapest power available to man.

It is generally believed by scientific men that the temperature of the earth increases one degree for every 60 feet of depth; and it is upon this basis that Professor Hallock has made his estimate. But, like all general rules, it is subject to exceptions, and in this case to very material ones, because the increase of temperature is not uniform.

Comparatively little has been ascertained regarding the interior of the earth, and the conditions that prevail there; yet it is known that the crust of the earth is exposed to quite as various conditions as its surface. Granite, for instance—especially if it carries much feldspar—gives off more heat than slate or other rock containing a high percentage of hornblende Lime gives off still more heat, at any time and in almost any condition, but especially when "slacked" or decomposed by sudden contact with air or water, or both.

These varying conditions cause widely diverging effects, yet Professor Hallock claims a temperature at 10,000 feet depth of 228 degrees; he is correct according to theoretical knowledge. If the increase of temperature were uniform, it could be depended upon that at 600 feet the heat would, the surface temperature being neutralized, be about 10 degrees. At 6000 feet it would be 100 degrees; at 10,000 feet about 166⅔ degrees.

Practice, however, has demonstrated that the increase in temperature is governed by conditions such as mentioned above, and instances of exceptionally high temperatures at comparatively shallow depths are not wanting.

On the Comstock, in Nevada, when the Savage and Gould & Curry mine workings were connected at their 2600 level, about twenty years ago, the temperature of the connecting drifts—that from the north in the Gould & Curry and that from the south in the Savage—was, respectively, 145 degrees in the former and 137 degrees in the latter. The temperature in the Gould & Curry mine would have indicated an increase of one degree for about every 18 feet of depth. Other workings in the Comstock lode, technically referred to as "hot ends," and at shallower depths were still hotter.

Instances of the effects of local conditions upon temperature might be multiplied; but these will suffice to demonstrate the soundness of the allegation that the temperature varies greatly with depth. This will not, however, detract from the value of the work Professor Hallock is doing. If he obtains vapor or "steam" in commercial quantities by his hole in the ground he will render a benefit to the world that will be of inestimable value.

Music Heard 860 Miles away.

A novel test of the long-distance telephone line conecting San Diego with San Francisco was made one night last week when the San Diego City Guard band played to an audience of several hundred persons in the Mechanics' Pavilion, San Francisco, and Bennett's band, stationed in the Pavilion furnished music to over 200 persons in that city, 860 miles distant from San Francisco, as the wire runs. The *Union* says the music was distinctly heard at both ends of the long line.

The arrangements at the San Diego end of the line consisted of a transmitter stationed on the bandstand on the plaza, a wire leading to the Schaefer building directly opposite, where connection was made through the local office of the Sunset Company with the long-distance line. The City Guard band rendered three selections over the wire, all were heard distinctly in San Francisco, where six instruments on the bandstand in the Mechanics' Pavilion afforded as many persons an opportunity to hear the music at the same time. Those in charge of the San Francisco end said that the music in San Diego was plainly heard and evidently much enjoyed by the listeners.

In San Diego six instruments had been arranged where a crowd surged about while the concert was in progress. While the music at the Mechanics' Pavilion was at times heard with great distinctness, the breaking in of listeners at small towns along the line frequently had bad effect.

The Age of Gold.

Mr. MacArthur, one of the inventors of the cyanide process for the extraction of gold, has been giving his views with respect to the future supply of that metal. He points out that true mining for gold only commenced about the year 1860, and that up to that time we had only been gathering up the detritus, as it were, alluvial deposits being merely what had crumbled down from the reefs. Now we are going to the sources and attacking the auriferous rock, of the extent of which we know very little, while of the depth to which they may descend beneath the earth's surface we know still less. They have been traced for 3000 feet downward, and geology confesses its ignorance of what may lie below. "There seems no limit," observes Mr. MacArthur, "to possible discoveries. Some years ago the proportion of the precious metal obtained from alluvial workings was as four to one compared with what was won from its rocky matrix. Now these figures are reversed. In Russia, including Siberia, the West Coast of Africa, British, Dutch, and French Guiana, some of the South American States and Borneo, the alluvial output is overwhelmingly greater than that from reefs, which is only a thing of yesterday. How great an increase in the yield may be expected to take place, therefore, in all these countries when the steam engine and machinery for crushing are brought to bear upon the reefs, of which the alluvial gold is the mere debris? "Gold mining," concludes Mr. MacArthur, "is just beginning to take the place that copper or lead mining has occupied for centuries. One has no more reason to doubt the continuance of gold reefs than one has to doubt the continuance of other metalliferous mines. No one can say what quantities of gold may be concealed in the more central parts of the earth, nor what improved means science may find for extracting it from great depths."

Mechanical Progress.

A Revision of the Patent Laws.

Several months ago, at a meeting of the National Association of Manufacturers, a committee was appointed to consider the desirability of changing the patent laws of the country in various particulars. The committee sent out a set of questions to a large number of inventors, manufacturers and other persons who might be supposed to have valuable opinions on the subject. The *Engineering News* recently discussed this topic at considerable length.

Regarding the suggestion that an international patent system might be arranged our contemporary says that the thing is desirable, perhaps, but not practicable. To reach a common standard, each country would need to make concessions; and the United States might be compelled to give up more than it would gain in the trade.

There are some Governments, that of Great Britain, for instance, which impose an annual tax or annuity on patents; and Americans taking out patents abroad must submit to these exactions. Retaliation, in the shape of a tax in this country on patents taken out by foreigners only, has been proposed. Great Britain would not change her policy because of such legislation.

The committee referred to asks for advice on having patent litigation conducted before a separate and special court, in order to facilitate the disposition of cases. Our contemporary is in sympathy with the suggestion, but believes that the reform most needed in this connection is a prohibition of the appeal and second trial, which so often delay a final decision of patent suits for years. The opinion is expressed that the first tribunal is usually quite as competent to get at the merits of these cases as the subsequent one. It frequently happens when one inventor applies for a patent that he finds some other patent covering a part of his idea already on record. The earlier patent may be four or five years old, and may not be doing the patentee any good. And it blocks the way for other inventors. If a tax, or annuity, were assessed on all patents the holders would pay it gladly if any business was being done in consequence of such grant of exclusive rights; but if no sale was effected nine men out of ten would probably surrender their patents altogether rather than pay the tax. An assessment intended to invalidate all sleeping patents in this manner and to leave the way clear for other inventors is one of the schemes

lately brought forward for consideration.

Another obstacle which is often encountered by the applicant for a patent is the discovery that there was an old-time patent which not only has expired, but has never been turned to account at all. The later inventor finds a better way to carry the idea into practice, and perhaps enlists capital in support of it, but a new patent is denied under our present laws. There are many improved processes and devices which would be brought into use to the vast benefit of the public if the patent system were so amended that expired patents on inventions which have never been put into commercial use should be made no bar to the granting of a new application for the same thing under proper restrictions.

The World to Be "Revolutionized."

The following New York dispatch of the 22nd inst. is a good example of newspaper statements regarding those matters:

"D. O. Mills, Vice-President Hobart, Pierrepont Morgan, ex-Governor Flower and other great financiers have organized a company to use the inventions of Nikola Tesla, and it is understood that the world will soon be revolutionized by the creations of his genius. Tesla shops and laboratories will be located in Brooklyn, where extensive property has been purchased. There has been talk of war between Edison and Tesla, but as to this Tesla says:

"'I must correct any erroneous impressions which may have been created. Whatever work I have done has not been inimical to the established Edison system, but, on the contrary, excellently adapted to go hand in hand with it. The interests of local companies may, to a certain extent, be opposed to each other, but that is an unavoidable condition to every step in advance.'

"As nearly as can be learned, the scheme contemplates the distribution of energy from one or more central stations, which will be effected by alternating currents. 'Lots of money' has always been Tesla's cry when talking of his ideas. Now he has capital and carte blanche to make all arrangements in the scientific matter of a plant that will not alone rival the Schenectady shops, but the workrooms of Wizard Edison himself.

"The possibilities of Tesla are enormous. The company will build its own power-house, with the end in view of supplying currents to the electric and elevated railroads of the greater city. When the first power-house is finished, over 150 miles of subway will have been laid under Brooklyn's streets and the battle of industry and science between the companies of Edison and Tesla will be fairly on.

"Tesla's ideas of the high potential will, it is said, be used in the supply of light and power, in conjunction with the transformer system. It is expected to get the price down to such a low figure that even railroads owning their own power plants will find it cheaper to buy current rather than to produce it."

The last two paragraphs are particularly delicious.

MUCH has been said and written about improved machinery, and its tendency to displace labor, but had it not been available for copper mining it is believed the true wealth of some mines would never be known, and the Tamarack mine and famous Red Jacket shaft of the Calumet & Hecla would probably never have been put down. The sinking of shafts to a depth of a mile has been made practicable by the use of drilling machines and high explosives. To sink a shaft similar to those above mentioned by hammer and drill would be almost impossible. With hand labor not more than 25 feet a month could be sunk, at which rate it would take about sixteen years to sink the Tamarack No. 5, and it is unlikely that the project would have been undertaken under such conditions. So that while the drilling machines have displaced a number of men, it has been the means of developing properties which otherwise would likely be left untouched, and thereby giving employment to more men than could have found work in our mines had the old system of mining by hand labor been continued.

THE current number of the *Scientific American* has an illustrated article on the removal of Arch Rock in San Francisco bay, the points being furnished by O. Von Geldern. As heretofore stated, the plan is to drill holes to the required depth and charge with dynamite. Drills can be operated either from boats or stationary platforms resting upon the face of the rock, and adjustable for all depths and contour and easily operated at all stages of the tide or conditions of the weather. The softness of the rock will permit rapid progress when the work is begun. Not more than two seasons will be required for preparation, and one blast, it is calculated, will utterly obliterate the rock as it now stands. Mr. Von Geldern calculates that 40,000 cubic yards of rock must be removed in order to attain the required depth of 30 feet at low tide. The plan pursued in blowing up the rocks at Hell Gate, New York harbor, was considered, but he believes that the work can be quite as efficiently performed, and much more cheaply, by drilling from the exterior. It is believed that the whole expense will not exceed $100,000.

THE power of ocean waves has recently been measured by a dynamometer invented by Thomas Stevenson. The apparatus consists of a vertical surface of a given size, which rests upon springs, the resisting power of which has been exactly measured. The force exerted upon the springs is recorded by a registering apparatus upon a roll of paper, and can be read off by means of a scale. The apparatus is fastened to an outlying rock at ebb tide, being exposed to the flood. Experiments made with this dynamometer have shown during a storm a pressure exceeding 7500 pounds per square foot. This, however, is not considered the full extent of the power of the waves, for it is known that rocks weighing from six to fifteen tons have been displaced almost 70 feet in a horizontal direction by the power of the waves, and the power mentioned above would not be sufficient to exert that strength.

Electrical Progress.

Electric Development in Southern California.

To the Editor of the Electrical Review:

Your correspondent has just returned from a trip to the headwaters of the San Gabriel river, the purpose of which was to gain definite information regarding the various electric power schemes, projected or under way, on that stream. We find that the Crystal Lake Company, which takes up the waters shed from the mountains about Pine Flat, turns them into Crystal lake, and thence by tunnels and pipes to power house on Sycamore flat, some nineteen miles from mouth of canyon via North and Laguna Forks, has completed surveys, built diverting dams, and completed a wagon road to site of power house. Their further plans have not yet been made public.

The Electric Power Company of Los Angeles, successor to the San Bernardino Power Company, has completed its surveys of pipe and tunnel lines and is now locating a pole line down the river. One canal will start at the mouth of Fish creek, twenty-five miles from mouth of canyon as the river runs, pick up the waters of Iron Fork and the main river and deliver them through three miles of ditch and pipe and two and one-half miles of tunnel at the head of Suzanne canyon. Cold water and Cattle creeks will be delivered into the main canal by a three-mile lateral. The second canal will run from Bear creek, by way of Sycamore Flat, in two miles of tunnel and six miles of pipe and canal to the same place at the head of Suzanne canyon, where the waters will unite and drop through a steel pipe 1950 feet to the power house, thirteen miles from the mouth of the canyon. The drop here is 650 feet, and is expected to furnish 4000 H. P. From here the waters are carried about three miles below and dropped 300 feet, developing 300 H. P. The Electric Power Company has sold $500,000 worth of bonds with which to do this work, and has contracted to deliver one-half the power needed by the Los Angeles street railways by the first of July next, which will necessitate the immediate beginning of the work. Bids will be asked for just as soon as the specifications can be drawn from the surveys. This company has unlimited capital, both in its membership and through personal connections, and will make things move lively. The rights of way have been granted over the reservation and the papers will be here in a few days.

The San Gabriel Power Co., whose plans have been published in detail in the *Electrical Review*, takes up the water where dropped by the Electric Power Co., and conducts it to the mouth of the canyon, dropping it into the irrigating ditches. This company has 150 men employed on tunnel work alone, nearly all of their many tunnels, the longest of which is 1600 feet, being worked from both ends, night and day in eight-hour shifts. The California Construction Co., which has the contract for the work, will complete it some time during the month of March next.

When these enterprises are carried through, and everything looks favorable now to their early completion, and with the Redlands Power Company's plant in operation, what more reasonable to expect than that the so-called kite-shaped track from Los Angeles through Pasadena, Azusa, N. Pomona, San Bernardino, Redlands, Riverside, Santa Ana and to Los Angeles again, comprising 150 miles of heavy steel track, be "electrized?" There has been more than one conference between the leading spirits of the power company and the Santa Fe officials on this subject. G. W. T.

Azusa, Cal., Aug. 30th, '97.

Electric Grain Elevators.

There are now nearly 700 vessels engaged for a part of the season in carrying wheat on the great lakes. This is more than are employed in moving the export crop across the Atlantic, and the largest lake vessels are considerably larger than the ordinary ocean craft engaged in the same line of work.

At Buffalo, N. Y., the grain that is brought down the lakes again passes through the elevators for reshipment to New York and Boston. Two new elevators, which are now in process of completion there, are the largest in the world, and embody some new and interesting arrangements for the handling and storage of grain. The largest of these will have a capacity when completed of 3,000,000 bushels. The other is being built for a capacity of 1,000,000 bushels, with the probability of enlargement to 2,000,000.

The unique feature of these new elevators is that in them the old-fashioned wooden bins have been abandoned. Their place has been taken by a series of gigantic cylindrical steel tanks. In the largest elevator there will be three rows of these, with ten tanks in each row, each with a capacity of 100,000 bushels. The steel bins will be 84 feet high, and will be so arranged that they can be hermetically sealed in order to protect the grain from moisture. Between the rows of lofty steel bins will be smaller storage bins, into which the grain will first be moved from the vessel and afterward elevated to the larger bins by the usual cup method. The method of discharging the grain is interesting. The huge steel cylinders are raised above the floor and rest on square steel columns. Their lower ends are bowl-shaped with a valve at the lowest point so that by simply moving a lever the grain will run out and can be conveyed by steel tubes to cars or boats without the use of hoisting machinery. Every bit of machinery in the new elevators will be run by electricity from Niagara Falls, and 1000 H. P. dynamos are now being built for the purpose. The silent ease and resistless power with which these tons upon tons of grain are to be moved by Niagara's mighty arm, when compared with the old cumbersome methods of lifting and shoveling, afford a striking testimonial to the wonders of modern industrial development.

The Modern Dry Battery.

For certain classes of work, like telegraphing and electroplating a battery that will yield a continuous current for hours at a time is desirable, although dynamos have now superseded such batteries to a great extent. For another kind of service, like the occasional momentary ringing of a door-bell or an office call bell, a different sort of cell may be employed. The former are closed circuit batteries and the latter open circuit. The connecting wires of the latter variety are not allowed to touch and complete the circuit, except for brief intervals, whereas in the former there is a constant contact, demand and supply.

Dry batteries have come into extensive use of late years for open circuit work. A number of them are on the market, and they resemble each other in most particulars, although there are differences in their excellence. If, by accident, a cell of this kind is kicked over or broken, there is nothing to spill out on the floor. This peculiarity, as well as their cheapness, commends these devices strongly to popular favor. Only an electrician, though, can fully appreciate the difference between the composition of a dry battery and a wet one. To the latter class, for instance, belongs the so-called Leclanche cell. In this, packed in a porous cup and surrounded by powdered graphite and peroxide of manganese, stands a carbon rod, that forms one pole, and just outside of the porous cup, immersed with the cup in a glass jar containing a sal-ammoniac solution, in a rod of zinc, constituting the other pole. The so-called dry battery consists of an outer shell of zinc, a lining of porous plaster of paris, a central rod of carbon and a packing of pulverized graphite and peroxide of manganese between the rod and the plaster of paris. The spongelike filling is moistened with sal-ammoniac, and the top of the cup or jar is carefully sealed to prevent evaporation. But there is no free liquid to be spilled in case of breakage. That which constitutes the most important novelty in the construction of this apparatus is the addition of depolarizing agents to the mixture around the carbon rod. Chloride of zinc is one of them. After a battery has been in operation for a time there is a tendency on the part of certain gas bubbles to gather about and clog the action of one of the poles. This is polarization. Anything which tends to correct it would be a depolarizing agent. The effect of such an addition to the contents is seen in the recovery from fatigue which is observed in using a dry battery. If one should tax it for more than a few minutes continuously its action would grow perceptibly feebler. But after a period of rest its energy would be found to be restored.

In discussing the application of electric motors in machine shops before the American Society of Mechanical Engineers at the Hartford meeting, W. B. Whaley said that in two cotton mills containing the same amount of machinery, one driven by shafting and the other by electricity, the former required 530 and the latter 450 H. P. to drive them.

IN Chicago it is claimed that the trolley car has the advantage over the cable car in that it is always under the control of the motorman, hence is a much safer means of transit, but it would be difficult to get a motormon on the Mission street line in San Francisco to believe that.

Mining Summary.

CALIFORNIA.

Amador.

W. Dennis cleaned up last week at the American mine, after less than two weeks' run with five stamps, about $2000. A new pump was put in a few weeks ago at a cost of $1000, and the work of sinking is going right ahead. In a short time another level will be opened up and the entire ten stamps will be kept running steadily. Twenty men are employed.

At the meeting of the creditors of the Bay State mine, held in the office of Wm. J. McGee in Jackson last week, an agreement was made between the lien holders, whose claims aggregate about $5000, and the creditors who have no security. The common creditors are not to antagonize the lien holders and are to have until June 1st, '98, to pay the claims of the lien holders, who will have the property insured and pay the keeper. The creditors will try to bond the property for $20,000, which will pay all claims in full.

An Amador *Ledger* correspondent, writing from Antelope, says: "A mining boom seems to have struck the eastern part of this county and it is reported that quite a number of claims were recently staked off on Round Top, the well-known peak and landmark near the summit. Messrs. Cory McKenzie and William Leslie report having struck a 3-foot ledge of ore that assays $100 per ton."

Calaveras.

In the Meserve mine at Carson Hill the Oakland *Enquirer* notes a peculiar development. A 200-foot shaft has been sunk on the vein, from the bottom of which drifts were run on the foot wall for some distance, prospecting the ledge. As it appeared barren a crosscut was started to tap a parallel vein. After cutting a few feet the drift came unexpectedly into a body of ore which gave fine assay returns. The drift was continued in the ore, and at last accounts was in it for a distance of 26 feet, with quartz in the face of the drift. A careful test of the ore made by W. C. Ralston, shows that it will make about $10 to the ton. The indications are that a blind vein has been cut for there are no outcroppings.

At the Esperanza the *Prospect* reports work steadily going on with good results. The new three compartment shaft has now reached below the 700-foot level. At that level a station is being made and a drift is to be run south. The drift which is now being run on the 500-foot level along the footwall is 100 feet in length in good ore and will be continued right along. The ore in this drift is a great improvement on that in the 300-foot level and is increasing in richness as it goes south. The rock in the shaft at the 700-foot level shows up well, and a still further improvement is confidently expected in the drift which is to be run at that level. The shaft will be continued on to the depth of 1000 feet. The pitch of the vein is now about 60° instead of 45.

Doe & Jackson, on Esperanza creek near Railroad flat, last week out of twenty-five pounds of gravel, which they crushed in a hand mortar, secured $30. They have about seventy tons of the same in sight.

At Angels the proposed trustees' sale of the Carson Creek Mining Company claims, in default of the payment of a promissory note for $20,117, secured by a deed of trust covering the entire property, has been restricted by a San Francisco lawyer with an injunction on behalf of P. Phillips, a shareholder who alleges irregularity in issuing the deed of trust. The sale had been advertised thoroughly for a long time.

Prospect: At the Bund mine near Hawkeye the work of running levels and crosscutting is in progress. The old cable has been replaced by one 600 feet in length.

The water in the Thorpe mine at Fourth Crossing is pumped out.

An air compressor has been put up on the Santa Ana mine at Albany flat, and operations will be resumed.

Active operations will soon begin on the Keystone mine near Altaville.

The Dora group of mines on Indian creek, near Murphys, has passed into the hands of W. Lewis, I. Rosenthal and E. Wœne of San Francisco, and active operations will be resumed under the superintendency of W. G. Drown of Angels Camp.

El Dorado.

Under the superintendency of C. W. Teeney drifting is being done on the 300-foot level of the Ohio mine, one mile from Greenwood, with good prospects.

Republican: The mill at the Starlight has been shut down temporarily. Work still continues in the mine.

An air compressor weighing 11,250 pounds was received last week for the Pocahontas Mining Syndicate. Work was commenced on the new mill this week. The contract was let to the Union Iron Works and sublet to Culver & Ferguson. The mill will have a capacity of twenty stamps although only ten will be placed in position at present. An order for 80,000 feet of lumber and heavy timber has been placed with Bryant & Co. of Diamond Spring.

Fresno.

F. C. Burnett of the King Alfred Con. M. Co. of Mount Goddard represents nine claims, which are to be worked next season.

Inyo.

A group of five free-milling gold mines belonging to Taylor, Mathes and Hayt, in the Death Valley mining district, are reported sold to an English syndicate for $105,000. These mines are near Anvil springs, between Panamint and Death valleys.

Kern.

An artesian well is to be sunk 500 feet at Garlock.

D. N. Coffin, superintendent of the Visalia mill, has gone to Grass Valley to take charge of a mining property and mill.

The Meteor mine, Randsburg district, is reported sold for $20,000.

The Rand Mining and Milling Company has leased the Visalia stamp mill. A. D. Marchand is the new superintendent.

Mariposa.

The London Improvement Co., at Coulterville, have twenty-eight men at work on the Virginia mine.

The following is a Boston version of local matters. It is, of course, unnecessary to state that the Pioneer is a Placer Co. property and that the Santa Ysabel is in Tuolumne Co.:

The three gold mining properties now quoted on the Boston Stock Exchange have many similarities. They have no origin or ownership in common, yet they each have 100,000 shares of fully issued capital and are all mining the famous mother lode of California. Their cost price, including the $2 assessment paid upon Merced, and their mill property may be stated as follows in the order of their introduction to the Boston public:

	Shares Issued.	Sub'n Price.	Present Price.	No. Stamps.
1. Merced	100,000	12	9	40
2. Pioneer	100,000	5	6	20
3. Santa Ysabel	100,000	5	16	20

The Santa Ysabel is a comparatively new mine near some of the richest mines on the mother lode. It is now making its first regular mill run and good results are expected. The yield should be, except from the very rich stringers, above $8 per ton, and the expense of mining and milling under $4 per ton.

The returns of the Pioneer mine have been published intermittently. Such published returns have shown above $12 per ton, but this is above the average of the mother lode. This company has about $100,000 in its treasury, and the company may be resold abroad.

The Merced mine spent more than $500,000 in machinery, shafts and tunnels upon a very extensive group of claims (some four miles), known as the Boyd properties, but which, for some reason never yet clearly explained, failed to give mill runs of one-half the value per ton shown by the more than 1000 assays. All that can now be said is that the assayer was one of the most experienced men in his line, and his assays in copper, gold and silver have for years been unchallenged the world over and have measured the value in many million dollars' worth of mine products.

All the men responsible in the direction of the above expenditure are now "out." Work has ceased at the new openings, and the old shaft which made the reputation of the property has been reopened, sunk a few hundred feet, and levels opened out in good ore, with the bottom or sixth level showing some very rich ore. Meanwhile the new management is paying all expenses from the gold product from under the stamps without regard to any other accumulations in the mill. A few months more of such a record and Merced will be assured of a future, though it may never grind up mountains of gold-bearing rock or approach the expectations of one of the original owners, who declared that he expected to draw good returns upon a market valuation of $300 per share.

There has been some recent buying of Merced stock by original subscribers, who have declared to their friends that it was a "gamble," but they were willing to increase their holdings and see it through. Present officers of the company still have their original holdings.

Merced may or may not be a good speculative purchase at less than its cost price of $12, but it is inconceivable that there should be no considerable value in this extensive group of claims, whose value had been sufficiently demonstrated twenty-five years ago to warrant the drawing of contracts involving $2,500,000 to bring the river water power to the property, which contracts were to have been signed by competent parties at noon of a certain day. That forenoon the owner died.

Boston's interest in the above mother lode properties warrants the presentation of the following facts concerning the mother lode taken from reports of engineers and mining men reporting of late upon properties in no way connected with the above save that they are upon the same lode:

The leading mines of the mother lode have yielded profits to their owners of from $3,000,000 to $14,000,000.

They have paid proportionately more from the 500 to the 2000-foot level than they have from the surface to the 500-foot level.

All the great mines on the mother lode which are now paying millions have at some stage been shut down, many of them for years, by reason of inadequate machinery, or the encountering of poor streaks without the reserve to go through them.

Not one of the more than fifty mother lode mines that have been abandoned on encountering a poor streak has failed to respond on reopening and further sinking, or to increase in the volume and value of its ore at increased depth.

It was formerly contended that gold could not be found in fissures at great depth. Now it is known that the mother lode mines continue to such a depth as to baffle the skill and endurance of man to follow them.

Napa.

On the 13th inst. the Napa Con. Quicksilver Mining Co. declared dividends Nos. 82 and 83 of 10 cents each, amounting to $20,000, payable Oct. 1st, to stock of record Sept. 17th. The financial exhibit for the three months from June 1st to Sept. 1st, '97, is as follows:

Gross	$63,000
Expenses	30,987
Net	$32,013
Dividends	20,000
Surplus	$12,013

Nevada.

(Special Correspondence).—There is much activity in prospecting over in the Graniteville district, in the northeastern part of the country about twenty-five miles from Nevada City.

The success attained at the Gaston Ridge has given a new impetus to mining in that section. This property only a few years ago was abandoned at a depth of 219 feet. It had a pay chute over 1000 feet long, and produced nearly $500,000. The present company began a prospect tunnel two years ago and at about 1900 feet they have a strong ore body at a depth of 650 feet. They have 1800 tons of ore on the dump. The company is moving the mill and boarding house down into the canyon, and adding a rock breaker and concentrators to their machinery. Mr. Harmon expects to have the plant in operation by the 15th of October.

The South Fork Company near Graniteville is making advances in the development of their mine. A 5-stamp mill is in operation.

At Grass Valley the White brothers are developing their property adjoining the Osborne Hill mine on the south. They have a tunnel 400 feet tapping the ledge (which is from 1 to 4 feet) at a depth of 250 feet. They have taken 300 tons of ore from the shaft, 100 feet deep, which netted them $10 per ton.

Work on the Widbur, formerly the Diamond mine, is progressing favorably. The new shaft is down about 75 feet.

At the Maryland forty men have been temporarily dropped from the pay-roll for the present.

Placer.

Sentinel: Horse Shoe Bar Consolidated mine has resumed work after a shut down of one week employing a large force of men.

The Glen mine has incorporated. The holdings consist of 540 acres. The main tunnel at the mine is in 700 feet.

At the Goldie May quartz mine, above Forest Hill, the shaft is down 45 feet on the ledge. The width of the ledge is about three feet. Tests show a value of $20 per ton.

At the Bear River hydraulic mine, two and a half miles north of Colfax, the company with the hydraulic elevator will work the tailings in the river. Laying 4500 feet of pipe and building 4700 feet of flume is in progress. The pipe line will give a pressure of 430 feet. The company expect to make a trial run in October, and have a contract with the South Yuba for 500 inches of water for use next season.

The Three Star mine, six miles from Auburn, will be reopened by San Francisco men under the supervision of E. W. Chapmen. T. F. Chapman has sold his interest in the Zantgraf mine to his brother, E. W. Chapman.

The Bacarrat mine near Lincoln has been reopened, and renamed the Placer Klondike. D. Nelson is superintendent.

L. Balliett, superintendent Alder Mining Company, at the Van Avery mine, Blue canyon, has the first tunnel in 300 feet. The mill will be completed and in working order before winter.

The Blue Canyon Mining and Developing Company are running a bedrock tunnel to tap the old river channel two miles west of Blue canyon. The tunnel will strike the channel about 150 feet lower than any of those run heretofore.

Plumas.

In the vicinity of La Porte the Upper Dutch Company has men cleaning and widening their Feather river ditch that they may have more water for their next season's run.

The Thistle Shaft Company has ordered to be cut and delivered at the mine without delay 1000 cords of wood, which is an indication that this valuable mine will soon be operated again.

Work has been resumed at the Claybank. Two shifts are repairing the main tunnel. When the repairs are completed the company will run ahead 1200 feet towards the shaft on the ridge.

A. D. McMillan is opening up a gravel channel near the head of Curtis ravine, parts of an ancient channel running through that country.

E. Shinn, east of Quincy, has built a ditch and dam, and the mine is being opened.

Shasta.

A rich quartz ledge has been discovered at Castle creek, near Echo lake, about eleven miles from Castella, Shasta county, near the Siskiyou line. The ledge is supposed to be about 14 feet wide, and is very rich, carrying free gold. The strike has created much excitement in that locality and at Castella.

Carr & McCall, who recently bought the Boulder mine, will put twelve men driving a 650-foot tunnel to tap the ledge at a depth of 275 feet.

Democrat: H. B. Gaston, representing San Francisco men, has a bond on the Kosk creek mining properties for $70,000. The property is near Pit river.

The New quartz discoveries on Castle creek are turning out richer than at first was supposed.

On Soda creek new discoveries in placer are being made. Prospectors have flocked into the Castle creek district in such numbers that now about every available claim has been located.

Free Press: J. V. Motherwell has gone to French Gulch to assume the management of the Brunswick mine. The property is owned by Frank Rossi, who recently bonded it to M. D. Howell, a mining man of San Francisco, for the sum of $10,000. The time given on the bond is ninety days. Mr. Howell will employ six miners to work eight hour shifts in extending the tunnel which was run by Lane & Haywards when they held an option on the property. They failed to find the ledge, but Mr. Howell and Mr. Motherwell believe that they will succeed in the undertaking in which Lane & Haywards failed.

S. W. Cheney, manager of the Mammoth-Garfield mines in Old Diggings, is up from San Francisco to look after his property interests. H. L. Shannon, superintendent of the property, contemplates resigning his position in order to operate his own property, the Peach Orchard mine near Copley. Mr. Cheney will employ a new superintendent. He is now shipping from thirty to forty tons of ore per day to the smelter at Keswick.

Sierra.

The Lewis brothers of Loyalton, operating the Carman mine, near Gold lake, have pay dirt yielding $85 to a carload. Nuggets ranging from $10 to $100 have been found.

Supt. Copeland will move his quartz mill from Loganville to Slug Canyon.

A hitherto undiscovered body of gravel was struck last week in that portion of the Garnett Consolidated Company's property known as the Bunker Hill mine. The former owners of this mine had for years previous to their sale of it to the Garnett Company been of the opinion that a body of gravel lay in that portion of the claim in which it was found. The Garnett Company, presumably acting on the suggestion of their predecessors, started a tunnel and kept it going until the gravel was struck. A candle box of the gravel yielded 60 cents in gold, which, though far short of Klondike and Coffee Creek, is good for $10 a day to the pick.

The No. 9 mill and tunnel belonging to the Sierra Buttes Company have been rented to the Bigelow Mining Company for two years.

Enterprise: Moore & Bradv have found the deep channel it the Wah Hoo ridge near the Golden Era ground. The ground worked pays from $6 to $8 to the man per day, worked through an incline where the gravel and water is hoisted by hand.

A fire at the Young America mine, Sierra City, last week burned the company's buildings.

Siskiyou.

At a meeting of the executive committee of the Siskiyou County Miners' Association, at Fort Jones, September 13th, the following were appointed delegates to the convention of the State Miners' Association to be held in San Francisco on October 18th: John Daggett, Black Bear; A. G. Myers, Quartz Valley; M. C. Beem, Fort Jones; R. J. Nixon, Yreka; G. H. Vogan, Happy Camp.

Spangler Bros. have suspended pumping out and hoisting in their claim at the mouth of Humbug creek, owing to the low water in the Klamath rendering it impossible to run their current wheel.

At Happy Camp, Day & Co. are getting ready to commence operations. The Minetta B mine at Happy Camp is being worked with good success.

Morrison & Coburn are crushing rich rock at their ledge in Quartz valley.

Gentry, Herr & Collar, on Greenhorn creek, had five tons of quartz crushed, which yielded $15 a ton—$9 a ton clear, as it costs $6 a ton for hauling and milling. The Greenhorn blue gravel mine is still worked with very good success, notwithstanding the small supply of water realized from pumping out of the shaft. A rich body of pay gravel has been struck, and as long as good pay can be realized, work will be continued. When the winter rains commence to afford a good supply of water in the creek, the owners will be able to do much better.

At the American mine at Deadwood, thirty tons a month are crushed in an arrastra, average yield $20 per ton.

Messrs. Maguire and Hackathorn found a pocket on Greenhorn last week and on Monday last they took out over a $100. They are still following the stringer, which continues to yield gold in small amounts.

The Distlehorst and Barton dredger in the Klamath river is making a profitable run.

A 10-stamp mill will be erected this fall by the Aurora Mining Company, near the Schroeder, to be running by November 1st, next season. The ore mills about $21 per ton.

San Diego.

The Yuma *Sentinel* says J. C. Beatty of the Senator mine, in the Picacho district, has men at work doing development work and erecting a 20-stamp mill, and expects to have the mill in operation within sixty days.

The Los Angeles *Mining News* says that Senator Dorsey has succeeded in raising $300,000 for the development of his property in the Picacho district, and will soon begin the erection of a 100-stamp mill.

Fifty men are at work on the mines an San Mateo canyon, on the northern line of the county. The ore averages $16 per ton, and a live camp will propably be established there.

Tuolumne.

In the Rawhide mine a strike on the 600 level shows an ore body 18 feet wide in the face which works from $30 to $40 per ton in the mill. There are rich streaks in which the ore yields thousands of dollars to the ton. A station is being cut out at the 1200 level. When completed the shaft will be carried down to the 1300 level, where sinking will be stopped until next season.

At Tuttletown, says the *Independent*, strikes and encouraging reports are daily received.

On the Bluett and Thienes property they are down 130 feet, have passed through the country rock and again found slate a feature that surprises may of the old-time miners who had never heard or seen before a like formation under country rock in that locality.

The Arbona mine near Tuttletown is down 160 feet. A new and moderately equipped hoist will be erected.

The lowest level in the Gagnere mine is down 300 feet. Ground is being broken for a 20-stamp mill which the contractors have agreed shall be up and in working order by December 15. W. G. Long is superintendent.

The Patterson 20-stamp mill is to be taken down and supplanted by a 40-stamp mill.

At the Golden Star, Superintendent Park, on the 350-foot level a crosscut is being driven to tap the ledge.

At the Dutch mine sinking the main shaft

and drifting on the 300-foot level is the principal present work.

At the Grizzly the new main shaft is down 160 feet. When down 250 feet a drift will be run 100 feet on the vein to tap the old workings.

The Landers ranch has been bonded to Mr. Shanklin, who will prospect with a diamond drill for the Black Oak vein.

McLean & Leslie have bonded the Gladstone to a Stockton company.

Sonora *Banner*: The Fisher Gold Development Company are crushing forty tons per day through their mill. Lumber has been hauled to the Patterson mine below Tuttletown and a mill will shortly be erected. Drifting work goes on night and day at the Marvatt at Tuttletown under the supervision of Wm. Long. The Soulsby mine, at Soulsbyville, will soon resume operations under new management. Sinking continues in the Lady Washington and is under the supervision of D. Fisher. The Dead Horse twenty stamps are still running.

The App has about one-fourth of the regular force at work for the present due to lack of water. The additional ten stamps at the Black Oak are ready. It is reported that last Monday the company paid up all arrears.

The Wilson & Means pocket mine, being worked by Bluett & Thienes, is now down to a depth of 150 feet. When at about 120 feet from the surface porphyry was encountered which cut the vein and slate, 30 feet deeper the slate was again found. This is a new experiment and if it works satisfactorily it will be the cause of great many mines reopening.

Yuba.

R. H. Postlethwaite of Smartsville has his new dredger completed. It will be illustrated in next week's issue.

NEVADA.

The De Lamar townsite case has been decided in favor of the occupants of the townside by Judge Hawley of the United States Court at Carson, Nev. J. R. De Lamar and his associates had applied for a patent to the land under a mineral location, and the occupants instituted proceedings in opposition.

Silver City *Times*: A carload of ore and tailings was shipped to Chicago Sunday. The ore was from the Logan and Hully mine in Como, and the tailings from the Douglass reservoir. The material will be tested by the Peck process to see what can be done in the way of working it.

Capt. De Lamar has purchased the Reeves interest in the April Fool mine at De Lamar, and it is thought there that he will buy the Wilson and Dooly interest, which will give him entire control of the property.

The Austin *Reveille* says the company that recently purchased the Ione mines from Gage & Bradley and the Knickerbocker mill from Thomas Mitchell will be known in the future as The Nevada Company, with J. G. Phelps Stokes as president, who is making arrangements to develop the property on a large scale.

OREGON.

At Galice creek the Sugar Pine quartz mine, known as the Bolt or Green ledge, is to be worked after a long suspension. This mine has produced nearly $70,000.

Bronson and Loomis have bonded a tract of placer ground along Bear creek, below the Golden Fleece mine, near Ashland

Caldwell and Ingalls have bonded the dump of the old Ashland mine and say they will put in a cyanide plant.

Ruble Bros. are working the old Anaconda quartz mine on Coyote creek. They have shipped 2500 pounds of ore to San Francisco for treatment.

The Baisley-Elkhorn mine, fifteen miles northwest of Baker City, will pass into the hands of a New York syndicate, with a prospect of being better developed with ample capital. It is stated that the purchase price is $30,000.

J. C. Franks of Alameda has bought of Woodcock & Taylor their mining ground on Briggs creek for $3000.

The Yank ledge, 250 feet wide and one of the largest in southern Oregon, is being sampled with a view of putting in a cyanide plant.

WASHINGTON.

A special from New Whatcom says there is a veritable stampede from there to the new gold mining discovery in the mountains north of the State road to Hannigan pass. Some go on foot, some on horseback and some in wagons.

BRITISH COLUMBIA.

(Special Correspondence).—The Smuggler Co. cleaned up $7 per ton off their plates for last month's run. This mill could be run without concentrators, as it concentrates 50 to 1, and then only makes $60 concentrates. When their lease on the Strathyrn Company's mill expires next month they will put in a new 20-stamp mill. They have 8 feet of ore in the shaft, of which 18 inches on the foot wall is shipping ore averaging $15 per ton, the remainder going about $8.50 per ton. They are running a tunnel to tap the shaft at a depth of 350 feet.

The Joe Dandy is still doing development work, opening up the mine. They have good ore bodies, which they are blocking out. They have lately put up a steam hoist on one of their shafts, and are almost immediately going to put up a 20-stamp mill, which has already been ordered.

Work on the Tin Horn is progressing rapidly, they having at least 1500 feet of tunnels. Their ore body is 12 feet wide. Their 16-stamp mill, in eight 2-stamp batteries, will be running by Oct. 15th at the latest.

Capt. Duncan and Mr. Milbourne of the Montreal & British Columbia Development Company were in town last week, examining properties. Also Mr. Fowler of the London Gold Fields Company, with what results we could not learn.

Fairview, Sept. 13, '97.

The Wilcox mine, eight miles up Wild Horse creek, has been rebonded by Supt. White, representing the Canadian Pacific Exploration Company. The amount of the bond remains the same as in the first instance, namely, $40,000.

Journal: By B. C. Express there arrived in Ashcroft last night a gold brick from the Cariboo mine, the value of which was $61,987, the second washup of the celebrated mine for the season. The mine is still working, and were the water supply not short would make a remarkably good showing yet this season. The total output will be something over $150,000 for the season. Next year it is expected there will be a better water supply by extending the water system of the mine.

Ashcroft *Journal*: Around Quesnelle Forks the Golden River Quesnelle Company are hard at work on their mammoth undertaking of damming the waters of Quesnelle lake at the head of the South Fork.

ALASKA.

And now it is claimed that the new Klondike of the Northwest will be in Alaska Territory, on Copper river and its tributaries. The few prospectors in that country are reported to have been taking out from $10 to $100 per man. Next season the Copper River Transportation & Mining Company will run a line of vessels from Port Townsend, Wash., to Prince William's sound and Copper river points.

THE KLONDIKE.

Writing from Lake Linderman, August 31, C. H. Clark says:

"We have at last reached the sunny side of our trip, after a long month of the hardest kind of work. Many a good, strong man has broken down completely under the strain of overwork. Some are sick and some are hurt from straining themselves. Six men that I know of have been drowned and two were shot at Skaguay for stealing. We have had miserable weather, with hard rains and strong winds. Already it freezes here in the mornings. It snowed on the summit the day after we crossed, and has snowed all around this lake. The trail has been wet most of the time, and I have been packing 150 pounds. Have had several duckings in the rivers. This trail is a corker. If you decide to come in, by all means go by way of St. Michaels. There are 1000 people on this trail that can't get through this winter, and between 3000 and 3500 at Skaguay. The mounted police are still at Skaguay. It cost us from 40 to 50 cents a pound to get our stuff over. Meals are 75 cents, and the bill of fare is bacon and beans."

L. Relfe, in a letter from the Skaguay trail, written September 6, says:

"We have our stuff within thirteen miles of the lake, whence we can easily take it to the starting point in two trips. We are far ahead of the crowd. For five miles before reaching the summit the trail is simply terrible. On the sides of the hill the liquid mud stands 2 feet deep, and in some places it runs like a stream. There are sharp rocks and round rocks, and great slabs of granite, down which the horses have to slide into mud holes. There are fully sixty dead horses between Skaguay and the summit, and forty beyond the summit. You can imagine what a delightful odor permeates the atmosphere during our day's trip. Many men are selling out. One man offered 1000 pounds of grub for $50, and he had packed it seventeen miles. Of the 600 people who landed at Skaguay, only two besides ourselves are yet over the summit."

A Dawson City letter under date of August 18 says: "This morning there was many a smiling face as a boat and scow came into Dawson with at least 400 tons of provisions. For the last few days the people that had no supplies for the winter began to feel gloomy at the outlook, but the steamer's cargo cheered them up. The Trading Company had agreed not to sell more than two sacks of flour and ten pounds of sugar, and other articles in proportion, to any one person, so as to enable all to secure something. Business is carried on altogether with gold dust."

A Seattle, Wash., dispatch of the 22nd inst. says: The steamer Queen arrived from Juneau at 3:30 o'clock this afternoon. She brought down a number of gold-seekers who realize that it will be impossible to reach Dawson this winter. Winter has begun in earnest with the travelers on the Dyea and Skaguay trails, and all who do not intend to winter in Alaska are hastening out. The peaks of the mountains flanking the passes are blanketed 4 feet deep with snow, and the smaller streams are encrusted with films of ice. When the Queen left Skaguay, on Sept. 14th, there were many parties straggling in from the mountains, and it is stated that a majority will return to Seattle and await the return of spring. Preparations are being made to winter a number in both Juneau and Skaguay.

UTAH.

The Telluride Power Transmission Company are putting in a large plant in Provo canyon, and are transporting 400,000 pounds of machinery and 400,000 pounds of lumber from the railroad depot at Provo to their site in Provo canyon.

The *Tribune* says: A movement is organizing among mining men in Utah to secure the repeal of the law providing for a tax upon the net output of the mines, those who are advocating it urging that the average assessor has no knowledge of what constitutes a "net" output, in that he has no knowledge of what it cost to produce what is apparently to him a net output. "Take for example," says a Park City mining man, "the case of the Golden Gate at Mercur. Tell me where you are going to begin on that proposition to approximate the 'net output.' I have been assured by a number of Capt. De Lamar's staff that before he markets an ounce of gold he will have expended $1,225,000, this including the purchase of the ground, which was then but a prospect, its exploration and the blocking out of almost measureless bodies of ore, the acquirement of new ground, and finally the erection of a mill which promises to be the greatest that has been attempted in the West. These expenditures having been made, suppose that from the Golden Gate $500,000 of gold bullion was produced next year, at what point would the intelligent assessor begin the approximation of his net output? The proposition of a net output tax is a hideous thing as I view it, and I am informed that before the next meeting of the Nevada Legislature the inhabitants of its diggings will prepare a memorial in which it will be asked to repeal the law exacting a tax on the net output of the mines of that State. It has been found that there are other ways of reaching the end the law has in view, and mining men wherever the law exists are organizing to attack it on the ground that no one except the owner of the property is capable of determining its net output, and again that it is prejudicial to the industry upon which the West is mainly dependent."

The attack upon the law promises to be a very vigorous one, and that it will succeed is believed by a number of the most prominent men engaged in mining and smelting in the State. Should this fail, however, the Supreme Court will be asked to establish a point at which the "net output" begins, as was done in the State of Colorado. It is very likely that a meeting of mining men for the purpose of perfecting plans for the attack on the law will be called before the expiration of the year, as several producers have expressed a determination to fight the tax.

Mercur *Miner*: The Chloride Point mill will be 77 feet long; the tank room, which forms the ground floor, 212x52 feet. From the floor of the tank room to the top of the ore bin is a distance of 87 feet. A chute will bring the ore from the tunnel to the ore bin, and from the other parts of the works tramways will bring it to the same point. From the bin the ore descends to the crusher, capable of crushing 500 tons of rock per day, and from there passes through three sets of Cornish rolls before reaching the pulp bin on the third floor. On one side of the pulp bin will be located the precipitating tanks; on the other, the 70-horse power electric dynamo which will furnish the motive power. Ten tanks will be put in place now, each 20 feet in diameter and 6 feet deep. Later on ten more tanks will be added. Water will be brought 3000 feet and pumped 500 feet. The mill will be ready January 1st, '98.

IDAHO.

Near Silver City at the Cumberland, S. A. Easton of Spokane, Wash., will superintend future work.

Frederic Irwin, Supt. Idaho and Pittsburg M. & M. Co., is now consulting engineer at the Poorman property.

The Italian mine at Salmon City has been sold to W. E. Hubbard of Salt Lake City, Utah, for $50,000. The mine had been under bond for several months to R. W. McBride. Mr. Hubbard has started the mill and will add more machinery, putting in concentrators, more stamps, etc.

James Wilson and Chas. Stiller of Warrens say 600 men are employed in the district. Mr. Rebold's Little Giant, which is ten years old, has been averaging $140 to the ton. It is an arrastra property, and by this means only 75 or 80 per cent of the mineral is saved. He employs twelve men. The Keystone mine is giving good returns, and its owners talk of putting in a mill. The Ruth mine, owned by Mackintosh, has 10,000 tons of ore on the dump, which runs from $70 to $250 in gold to the ton and will average $100.

The Wallace *Tribune* says that never before was there such activity in the Cœur d'Alene country as at present. Between 1200 and 1300 men are working for wages in mines that are producing ore, besides 200 or 300 more who are doing assessment or development work—some for wages and others on their own account. Over 15,000 tons of concentrates are turned out every month.

The Arlington claim of the Canadian King group, on the North Fork of the Salmon river, has been bonded for $35,000 to the Hastings British Columbia Exploration Company. The property is gold-bearing, partly free milling.

At Pierce City it is the intention of both the Golden Gate and Golden Bar companies to go down on their ore bodies 200 feet depth, putting ore on the dump preparatory to milling the same. From the top of the Gold Bar ledge $1800 in coarse gold and nuggets was taken by the hydraulic process. It was found in cleaning up this gold from a mountain stream 300 feet higher than the water level of the main creek that the bottom of this small stream was really the top of the ledge. Its footwall is granite and hanging wall porphyry dike.

MONTANA.

Manager Kelley's report to the New Elkhorn Mining Co., of London, for July shows that the mine was operated at an expense of $26,455.65 and that the recipts were $27,493.77, making a profit of $1,038.12.

The Boston & Montana Mining Company have let a contract for the enlargement of their concentrator at Great Falls. The new addition will add fifty per cent to their concentrating capacity.

Montana's coal production in 1896 was 1,543,445 short tons; spot value, $2,279,672. The annual coal product of Montana has shown an uninterrupted increase each year since 1887, and the output in 1895 showed a phenomenal increase of over 62 per cent or 576,796 short tons over that of 1894. The value increased from $1,887,390 to $2,850,906, a gain of $963,516, or a little more than 50 per cent. The increase in production in 1896 was only 39,252 short tons, and this was accompanied by a short decline in value of the bituminous product in the United States. The value per ton declined from $1.69 in 1885 to $1.47 in 1896. The value per ton in 1892 was $2.36, indicating a decline of 89 cents, or about 35 per cent in four years. The development of the Montana coal fields on a commercial scale dates from 1889. Previous to that year the largest output was in 1885, when the product was 86,440 short tons.

Work on the Spotted Horse mine, in Fergus county, is being pushed on an enlarged scale.

In the Amazon district, in Jefferson county, Homes Bros. are about to begin development work on the Gift, recently bonded by them. The Great Northern is being worked, with a good showing of copper ore.

During the summer now drawing to a close a party of placer miners has been working the Missouri south of Great Falls by means of a dredge boat.

Placer workers are making fair wages in the Diamond Range, in Meagher county.

The Elkhorn mine, according to all reports, will continue to run if silver does not go below the present price.

At the Hawkeye mine, in Dry Georgia, Madison county, the work of development is going on with N. Trauffer as superintendent. He expects to turn out fifty tons of ore per day. The property is under lease and bond to the Montana Mining and Smelting Company.

The Butte and Yellowstone Coal and Coke Company, under direction of Manager A. O. Newton, are taking preliminary steps to increase their output of coal and erect ovens for the manufacture of coke. Engineer Crookes is engaged in surveying a route for a spur railway from the mines to Cannibar.

Ex-Gov. Houser, who has returned from New York, announces that while in the East he made arrangements for putting up at East Helena a Peck machine similar to the one recently put up at Corbin to work over the Carbon tailings.

There is considerable surprise in mining circles that the Eva May, in Cataract district, Jefferson county, is closed down. The miners were laid off on the 24th and the mill closed on the following Saturday. About forty men were let out. Shipments of concentrates had been made regularly of late and it was generally supposed that the ore was getting better all the time. No reason was given for the shutdown and no time set for the resumption of work. A special meeting of the stockholders is called to increase the capital stock of the company from 200,500 to 250,000 shares, at a par value of $10 per share.

The Clancy *Miner*, published in the Lump Gulch district, referred to the hard lines into which that high-grade silver section has fallen, as follows: Lump gulch, as a factor in the mineralogical world, is fast being regarded as one of the "has beens"—a conspicuous example of a silver-mining camp legislated off the face of the earth.

SOUTH DAKATA.

At Galena the Union Hill Company is building a 180-stamp mill, to cost $200,000. It is to be a double mill, with one large ore bin in the center, 150 feet in length, and on each side of this ore bin and running parallel with it a row of ninety stamps. The bin is 22 feet wide, 25 feet high, with a capacity of 1000 tons of crushed ore, which will pass automatically into the self-feeders, one feeder for each battery of five stamps. The crushing capacity of each stamp is about four tons of hard ore every twenty-four hour hours. The pulp will pass from the mortars onto copper plates, electro silver plated, one ounce of pure silver to each square foot of surface, amalgamated with quicksilver. There will be one concentrator for each five stamps. The concentrates will be shipped to the Edgemont smelter for treatment.

The Homestake Mining Company on the 2nd inst. made the largest cleanup in its history for a like period of time, viz., fifteen days. The shipment to the sub-treasury at New York aggregated $190,000. At this rate the output would be $380,000 per month.

The Highland mill will soon be remodeled and enlarged to 200 stamps, an addition of sixty stamps, and will be practically rebuilt. Superintendent Grier in his last report estimates that there is a twenty-year supply of ore in sight.

COLORADO.

The reorganization of the Ni Wot Mining Company, says a Denver paper, will mean an additional expenditure of over $500,000 in Ward. N. C. Merrill is secretary and treasurer.

A Denver dispatch says Frank Gardener of London has bought in that city the patents for all the world outside of the United States for the manufacture and sale of the Wilfley concentrator table for $250,000.

At Telluride A. G. Kirby, formerly of California, put in a plant just below the Smuggler-Union 50-stamp mill at Pandora, to treat the tailings coming from that mill. The feature that is principally patterned after consists of a large table covered with canvas, some 8x16 feet and others 12x14 and 12x16 feet, but the latter are usually divided into two sections. Mr. Kirby has a long row of these tables in his Pandora plant. After running the tailings over a couple of vanners, they are conducted in a trough along the head of the tables. There are little gates at intervals along the trough, one for each table, through which a graduated amount of the tailings flow. At the head of the table is an arrangement something like a palmetto fan, although many times larger, which distributes the tailings evenly along the upper end of the tables. In running over the tables, set an angle of from 10° to 15°, the mineral part settles on the canvas and the silica and lighter stuff passes over. Some of the parties that have adopted these tables contemplate covering them with burlap, believing that it would effect a closer saving than canvas. Notwithstanding that the Smuggler-Union mill is now effecting a closer saving of values than at any time in the history of the company, the tailings being reground after they leave the large vanner room, and run over a second set of vanners, Mr. Kirby is said to be realizing a net profit of $200 a day from the gold, silver and lead values saved by his plant.

The Summit County *Journal* points out that 60 per cent lead ore contains 1200 pounds of

lead to the ton which, at $4 per 100 pounds, is worth $48, but which at 40 cents per unit gives the miner $24 for his lead, or half what it is worth on a $4 basis.

In Gunnison the Taylor Park Mining Company has been steadily at work for two years and has expended $300,000 without taking out a cent. This preparatory work is finished. The officers are J. Preston, T. Goodale, secretary, and H. A. Watson, superintendent. The ditch brings the water of Taylor river and several other small streams 17⅓ miles, discharging the same at a height of 775 feet above the highest point on the placer ground. This ditch is completed and in use for 13½ miles. It is 6½ feet wide at the bottom, falls 15 feet to the mile and will carry about 36 inches in depth of water. At present a depth of about 14 inches is maintained. In one place a tunnel has been run through a hill to save distance. An average of 100 men have been kept busy on its construction. All labor is paid at the rate of $3 per day of eight hours. The company owns 3000 acres of placer ground.

NEW MEXICO.

The Pinos Altos Gold Mining Company has about 100 men employed upon the various properties recently purchased. The Hearst shaft on the Pacific vein, formerly known as the Pacific Gold shaft, has been sunk 200 feet in the past three months. A new steam hoist has been placed upon the Gillette shaft on the Pacific vein, formerly known as No. 3 shaft of the Bell and Stevens properties. This new hoist has a capacity to hoist a ton of ore 1000 feet per minute. On the Mina Grande the company has let a contract to run an adit level from the outcrop of the vein on the south part of the claim, running north 1100 feet. The first practical mining on an extensive scale ever carried on in New Mexico is now under headway upon these properties.

ARIZONA.

In the Bradshaw range, the Phoenix *Herald* reports at the Crown King for the past eleven months 6426 tons of ore have been handled at the mill, yielding $186,200.13, an average of $28.84 per ton. A cyanide plant is nearly ready for operation. The tailings will be roasted before treatment. The main tunnel of the Crown King mine is driven 1901 feet into the mountain. The apex of this elevation is 1000 feet, vertically. From entrance to face this tunnel was driven on the vein. It will require 400 feet of an extension to reach the apex of the mountain. The steam hoist is located 211 feet above the main tunnel and on the surface. The levels below the main tunnel are four in number. The first is driven 1626 feet, equally divided north and south on the lode. The 200-foot level shows 1373 feet. The 300 level has 1088 feet. The 400 is driven 683 feet. Reports say the richest ore is coming from the 400 level. Pumps are stationed at the third and fourth levels. The supply of water continues to increase on the lower levels.

The Maganetta Gold Mining Company, capital stock $500,000, has been formed in Yuma. The Page Gold Mining Company, capital stock $3,000,000, has incorporated at Prescott.

Prescott *Journal-Miner*: At the head of the Hassayampa, the Chicago Company's mill is in operation day and night. Superintendent J. S. Douglass of the Senator Company is getting the Senator mill in readiness to start up soon. Superintendent Tullgreen, of the Storm Cloud, is building a mill to treat the ores from that property. The latter will have a capacity of from ten to fifteen tons per day.

Republican: Twenty-seven miles south of Willcox in the hills in Sulphur Springs valley, and in the big Dragoon range, a few miles further south, are a number of gold, silver and copper propositions being developed and prospected, those attracting most attention being the Commonwealth group and Gold Cliff. At Pearce the Commonwealth company is shipping ores to El Paso and Colorado points; getting out four carloads daily. Stoping shows ore 40 feet wide; easily worked; free milling gold and silver rock. One hundred men are employed in and out of the mine; paid $3 and $2.50 per day. R. A. F. Penrose is president, John Brockman the general manager and superintendent.

MEXICO.

Under date Dos Cabezos, Arizona, Sept. 17, a correspondent writes: "Mexico has always had an export duty upon gold heretofore about 7 per cent. What the new regulation is I do not exactly understand, but I think it prohibits the exportation of gold. The idea, as I understand, is to accumulate gold so as the nation can adopt the gold standard. It would hardly seem feasible but the federal authorities of Mexico think so."

Our correspondent is partially right as to the gold export duty. The new law which went into effect July 1, '97, provides an interior stamp tax of 3 per cent on the value of the metals, coinage charges at the rate of 2 per cent on the value of the metals and assaying charges, and charges for smelting, refining and separating are to be levied in accordance with the tariff which the Department of Finance may publish. The basis for estimating the value for gold and silver is fixed at $40.915 for a kilogram of silver and $675.446 for a kilogram of gold. In addition to gold and silver in mixed bars, or pure sulphides of silver, argentiferous copper and lead, mineral in a natural state or concentrated, or which may have been to a certain extent treated, and generally any other ore or substance which contains silver or gold, are subject to these taxes and charges. Foreign money is not liable to the tax, except when introduced to a mint for the purpose of recoining. The Department of Finance is authorized to grant special concessions to concerns which are in the habit of exporting ores in large quantities, provided they satisfactorily prove by means of their books and other documents the weight and proportion of metal of the ores which they wish to export, and that they admit for this purpose the unconditional investigation of the fiscal inspectors. This concession may be extended to arranging with the exporters for the payment of a fixed sum as remuneration of the Government for the cost of the assay and inspection of said mineral substances. In no other case shall it allow an exemption from or rebate on the stamp tax and coinage charges established by law.

In Sonora the *Oasis* reports that the Mexican Venture Syndicate—a sub-company of the Mexican Gold and Silver Recovery Co.—have acquired property adjoining the Esperanza mine and are sinking a three-compartment shaft now down 250 feet. The Carmen mine, in the same district, owned by the Gold Mines Consolidated (another sub to the parent company) is sinking a three-compartment shaft now down 470 feet and has developed gold-bearing quartz. A 12-stamp mill, which will use the direct cyanide process, is in course of erection.

The La Compania Minera Esperanza y Annexes, in Mineral del Oro, district of Ixtlahuaca, State of Mexico, on what is claimed to be an extension of the San Rafael vein, has opened the mine, built a 40-stamp mill, an electric-light plant and telephone line. The *Oasis* says the ledge reaches a width of 150 feet with a pay streak on the hanging wall 25 feet in width, the ore from which yields $25 to $30 gold per ton, and that the property is bonded to Chas. D. Lane and associates of California for $6,000,000, Mexican money.

City of Mexico *Herald*: C. D. Lane, the well-known California capitalist, accompanied by his family, has returned from El Oro district. He has taken some people to look at the Esperanza. He says he could not tell whether the deal for it would go or not; that the mine was everything that had been said of it, he said, there was no question, but that in nearly every mining deal some objection or other was naturally raised. He said nothing about the forfeiture of the $100,000 guarantee, which it is said he put up, and its prospective loss did not seem to worry him. While it was reported he had gone to Europe, he said he had gone only as far as New York City, but that his negotiations were with European capitalists.

PERU.

(Special Correspondence).—The Santo Domingo mine of Peru, South America, is one of the richest old mines of that country, and was purchased by Messrs. Collins and Emery of Bradford, Pa., about two years ago for the Inca Mining Company of Bradford. Extensive machinery is on the way there and during the coming year this mine is likely to become a large producer, as the ore is very rich, running gold into the hundreds of dollars per ton. This property is owned by a few wealthy oil men and will not be put on the market. Vivian K. Spear and James W. Caldwell leave New York city, as manager and metallurgist, on the 20th instant to take charge of the mine.

New York, Sept. 14th, '97.

NICARAGUA.

A decree published August 15th, and taking effect immediately, established an export duty of $1 gold per ounce on gold ingots and $2 per ounce on gold dust. The information comes to the State Department from Consul Clancey at Bluefields. He says the old duty was 35.44 cents per ounce on gold. The mining interests have united in petitioning the Government to revoke the decree, which, they assert, would be ruinous to a new industry. Last year the gold exports from Bluefields amounted to $169,565, an increase of $31,636 over the preceding year's shipments.

Recent California Mining Incorporations.

Tipton Hill G. M. & D. Co., San Francisco; L. Barringer, T. D. Gaman, W. J. Gwynn, J. H. Smith, F. S. Williams; capital stock, $500,000; subscribed, $25,000.

Glen Con. M. Co., Auburn, Cal.; P. G. Halligan, J. A. Shields, D. A. McDonald, G. R. Cowan, F. G. Hoffman; capital stock, $75,000; subscribed, $60,000.

Unity G. and S. M. Co., Grass Valley; J. Terrill, J. B. Richard, H. Green, E. Audren, W. Martin; capital stock, $1,000,000; subscribed $760,000.

Kellogg Creek G. M. Co.; W. Bogen, R. Herold Jr., T. M. Schumaker, E. A. Hansing; capital stock, $100,000; subscribed $20.

Last Chance M. Co., San Francisco; W. F. Barnes, C. W. Porterfield, P. S. Platt, A. D. West, E. L. Hawk, G. F. Maydwell, C. H. Hubbard; capital stock, $500,000; subscribed $200.

Recently Declared Mining Dividends.

Champion M. Co., Cal., 41st dividend of 25 cents per share, $8500, paid Sept. 21.

Napa Con. Q. S. M. Co., Cal., regular dividend 10 cents per share and extra same amount, payable Oct. 1st, $20,000.

Coast Industrial Notes.

—G. W. McNear will build a 2000-barrel flour mill on the south side of Carquinez straits, Cal.

—At Stockton, Cal., the combined harvester works were destroyed by fire last Monday; loss, $100,000; insurance, $60,000.

—O. F. Place, from San Jose de Guatemala, Central America, writes that it takes $3 of Guatemalan money to buy $1 of Uncle Sam's money.

—The roller mills at Pendleton, Or., with a capacity of 500 barrels, owned by W. S. Byers, were destroyed by fire on the 20th inst.; loss, $150,000; insurance, $50,000.

—San Francisco men have taken the entire $6,000,000 of bonds of the San Francisco & S. J. V. R. R., which ensures its extension to Bakersfield and the connecting line from Stockton to San Francisco.

—Of California deciduous fruits up to Sept. 1st there were sent to Eastern points 88,750,000 pounds—3550 carloads. Two thousand carloads of grapes will be sent East before the season closes in November. It is thought that before the end of the season 187,500,000 pounds of green fruit, or 700 carloads, will have been sent from California to Colorado points further East. The season is the best in the history of the fruit industry of California.

—The steamship Moana from Sydney brings to San Francisco $4,000,000 in English sovereigns, in payment for wheat shipped from here to England, the second payment from the same source for this season's wheat crop. The Mariposa brought $2,250,000 in sovereigns last month as a first installment. The *Call* says: "A conservative estimate places the total amount for the season to be received from that source at $25,000,000."

—The Sierra Co.'s mill, Chico, Cal., cuts 80,000 feet a day, and this season will supply about 8,000,000 feet of lumber. The logs are brought six miles by a chute. There are three engines employed and five donkey engines are used in the woods. In the chute 36,000 feet of cable is used and 18 logs at a drive are brought. This lumber is sent to Chico by a flume, the total cost of putting the lumber in, sending it down and taking it out and piling it in the yard at Chico being 85 cents a thousand. There are 155 men employed in the woods, the mill and on the flume. The flume is twenty-five miles long.

—The Los Angeles *Times* notes the talk about railroads to Randsburg. The Santa Fe is supposed to be building one from Kramer, and the Southern Pacific is to run a rival line from Mojave and thinks that the Santa Fe, now that it owns the old Atlantic and Pacific road, is not going to start at Barstow with a tap line to Randsburg. The Santa Fe people have intimated that, if they build any extension to their lines, they will build through Tejon Pass into Bakersfield and there connect with the Valley road, getting an outlet to the sea. So far as the Southern Pacific is concerned, they will build nothing just at present. All the money they have to expend in railroad building will be devoted to their line via Santa Barbara and the coast to San Francisco.

—The annual report of Governor Otero of New Mexico says the population of the Territory has increased by 100,000 since the census of 1890, and calls attention to the fact that New Mexico is a gold-bearing country, and that within the past few years there has been a great renewal of activity in the mines. He says that several districts have been found and new placer beds have been worked by new men who have taken out thousands of dollars, and he adds: "Information which is reliable, from gold camps throughout the Territory, strengthens the hope that New Mexico will soon reap the benefit of a genuine mining boom. Never has there been such interest since the advent of the railroads in the mining development of the Territory, especially near the Colorado line." Governor Otero says there are 5,000,000 sheep in the Territory, that fully 15,000 of the people are supported by the wool industry and that last year was the most advantageous ever known in the business.

—Wm. Price of McKeesport, Pa., represents a company of Pennsylvanians who, he says, are to erect and operate a plant at Port Angeles, Wash., for the manufacture of tinplates. "The process will be started in a blast furnace and ended with the shipment of high-class tinplates to their destination. From the conversion of the ore into pig iron the product will be sent to the open hearth steel plant, where it will be turned into bars. The rolling mill will reduce the bars to plates of the requisite thickness and the plates in turn will pass through several baths to remove the oxide of iron. The next step toward turning out a finished plate is to dip the plates in melted tin and the finishing process is to pass the plates through cold rollers, which polish the deposit of tin. The tin that will be used will be imported from Tasmania, and can be laid down on the Sound for much less than in the Eastern manufacturing towns of the United States." The Pacific coast uses 27,000 tons of tinplate annually.

Personal.

H. A. KELLAR is now manager of the Siskiyou copper mines, Illinois river, southern Oregon.

GEO. DAVIDSON would be an excellent successor to Prof. Holden at the Lick Observatory.

H. BRATNOBER writes that he expects to return from the Klondike overland via Juneau next spring.

H. VISCHER, Assistant Debris Commissioner, is inspecting restraining dams in southern Plumas and northern Sierra, Cal.

J. S. WALLACE is superintendent of the Rachel mine, Baker City, Or., and thinks of building a 10-stamp mill this season.

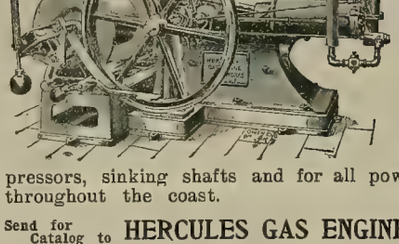
COMMISSIONER WM. OGILVIE says he does not think the Canadian Government will attempt to enforce the 20 per cent royalty in the Klondike.

GEO. W. MCCOY, manager White Rock G. M. Co., Baker City, Or., is about to put up a 10-stamp mill and two concentrators at the Perry mine.

SENATORS CANNON AND PETTIGREW and ex-Senator Dubois have arrived in Tokio, Japan, and arrangements have been made for an interview with the Emperor on the silver question—the principal purpose of the senatorial visit to the Orient.

PRINCE PONIATOWSKI and T. S. Bullock, who are spending about $800,000 in the construction of the Sierra Pacific railroad from Oakdale, Cal., to Jamestown, Tuolumne Co., Cal., expect to have the road completed by October 7th. It will be forty-two miles long and reaches an elevation of 1600 feet from Jamestown, three miles from Sonora. Thirty miles of road are now in successful operation.

Hercules Hoisting Engines



Solve the difficulty of fuel, and make mining profitable where steam power is too expensive. Over 3000 Hercules Gas and Gasoline Engines are in use giving entire satisfaction. Fully guaranteed. Requires no engineer. No smoke, no dirt. No danger.

We build engines from 2 to 200 h. p. for pumping, hoisting, running air compressors, sinking shafts and for all power purposes. Used in mines throughout the coast.

Send for Catalog to HERCULES GAS ENGINE WORKS, 217 BAY ST. San Francisco, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WAVE POWER PUMP.—Orrin W. Parker, Oakland, Cal. No. 590,072. Dated Sept 14, 1897. This invention relates to an apparatus which is especially designed to utilize the constant motion of the waves and the storing up of the power generated thereby. It consists essentially of a float resting upon the surface of the water at a sufficient distance from the land, a frame extending from the float to a suitable point where it is fulcrumed and connections between the frame and a series of pumps by which the pumps are actuated from the float so as to continually throw water into an elevated reservoir or receptacle, and in connection with this are means for adjusting the apparatus to the variation in the tide and the throw or stroke which it is desired to give the pump.

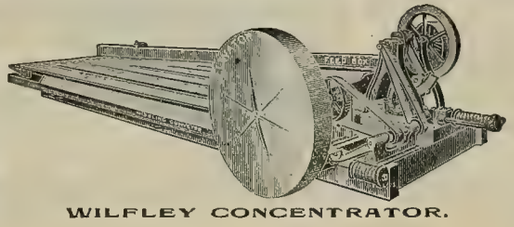
SOLE AGENTS IN CALIFORNIA FOR THE CELEBRATED

WILFLEY CONCENTRATING TABLE.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.



WILFLEY CONCENTRATOR.

SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, barring none.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

MINERS, ATTENTION!

We beg to call attention to our RISDON HAMMERED PROJECTILE STEEL SHOES AND DIES, which are made of a special quality of steel, are hammered and then compressed in moulds so as to give the greatest possible density.

These Shoes will outlast any other make and will not chip or cup.

We have attached a sketch showing sizes; fill in the size of your Shoes and Dies, and order a trial set.

Our prices are as low as any, and the article we offer should commend it to all mine owners and mill men.

W. H. BIRCH & CO.,

Office and Works, 127-129-131-133-135 First Street, San Francisco Cal.

WRITE FOR A CIRCULAR ON THE

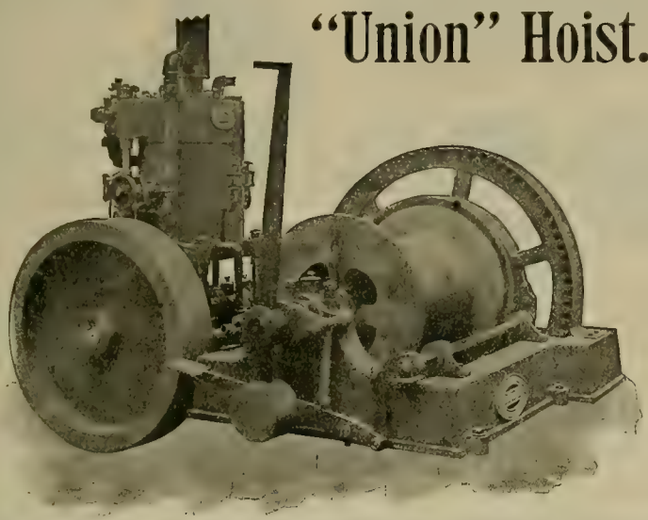
"BIRCH" IMPROVED TWO-STAMP MILL.

IRON FRAME, TRIPLE DISCHARGE, 850-LB. STAMPS, FORGED STEEL SHOES AND DIES.

Price, $450 f. o. b.

Manufacturers of the LIGHTNER QUARTZ MILL.

"Union" Hoist.



The above cut represents our 10 h. p. Double Cylinder Engine of latest type, and Hoist combined on strong iron base. This hoist is designed to raise one ton125 feet per minute from an inclined shaft, or 1500 pounds at the same speed vertical lift. The drum will hold over600 feet of ⅝-inch cable. The outfit weighs 3500 pounds.

THE UNION GAS ENGINE CO.

—BUILD THE—

"Union" Gas Engines,

Which use either Manufactured or Natural Gas, Ordinary Stove Gasoline (Naphtha or Benzine), Distillate or Kerosene.

STATIONARY ENGINES for All Kinds of Work, Built in Sizes from 3 to 200 h. p.
"UNION" COMBINED HOISTS in Sizes from 2 to 40 h. p.
"UNION" COMBINED COMPRESSORS—20, 30, 40 h. p.
HOISTS and COMPRESSORS Can Be Built in Larger Sizes to Order.
"UNION" MARINE ENGINES, 4 to 200 h. p., of Single, Double and Four-Cylinder Types.
TEN YEARS' EXPERIENCE Building Gas and Oil Engines.
"UNION" ENGINES Are In Use All Over the United States.
"UNION" ENGINES Are Simple, Durable and Economical.

Office: 314 HOWARD ST., SAN FRANCISCO, CAL.

Yukon Boats and Sleds.

Stern Wheel Boats, 25 ft. to 200 ft. in length. Light draught. Shipped--knocked down--and set up at St. Michael's ready to run. Send for Circulars and Prices.

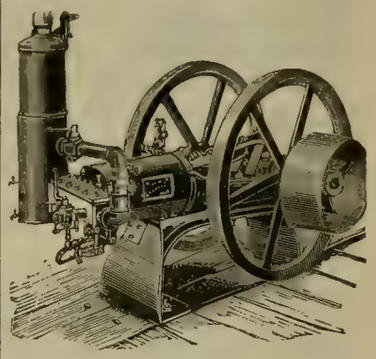
Cheap Power!



SAVE MONEY BY USING

—THE—

"DANIEL BEST" Crude Oil Engine.

This Engine can be operated on either Crude Oil, Distillate, Gasoline, or Kerosene. **It is the cheapest power on earth** and is not tied to any one kind of Oil, but can use any kind that will make gas and is not handicapped by being compelled to use a certain Oil. Do not forget this when in need of an Engine.

We guarantee our Engines to work perfectly on California Crude Oil, or Distillate, or any other kind of gaseous Oil; we however prefer CALIFORNIA CRUDE OIL, from Coalinga, Fresno county, for the reason that gas from Crude Oil will produce more power from the number of feet of gas used than from any other Oil, and it is also a natural lubricant as well, the valves being always lubricated sufficiently to prevent them from sticking, thus assuring greater durability of the working parts than it otherwise would be in using dry gas. And another advantage we claim is, that danger from explosions is reduced to a minimum, there being no accumulation of gas, but is used by the Engine as fast as it is generated and hence is absolutely safe. The following is a test that we made with one of our Five-Horse Power Crude Oil Engines, running ten hours on the different gas oils:

California Crude Oil, 40 grav..	7½	galls. at	5c..	$.37½
Distillate.....	40	"	7½ "	8c.. .60
Domestic Coal Oil....	40	"	7½ "	12½c..93¾
Gasoline.....	74	"	8¾ "	15c.. 1.31¼
City Gas.....	1000	feet.		2.00

We manufacture all sizes from two-horse power up, and will guarantee that our Engines will run cheaper and are more simple in construction, have fewer parts and hence are more durable than any other Gas Engines on the market. Seeing is believing; don't take our word for it, but come and investigate for yourselves. You can always see one in operation at our works. We will be pleased to see you and will at all times take pleasure in showing them up. Our Engines are specially adapted for running well and mining machinery—in fact, for any kind of power desired. We are the pioneers and first inventors of Crude Oil and Distillate Engines. **We always lead and never follow.** Send for Catalogue and Price List of the only genuine Crude Oil and Distillate Engine made.

ENGINEERS AND MANUFACTURERS,

Beg to draw your attention to the introduction of the . . .

FINLAYSON PATENT WIRE ROPE TRAMWAY.

It is of the double rope pattern and the newest and best thing in its line ever placed on the market. The automatic features, simplicity of construction, ease of running and economy in operation places the

Finlayson Tramway

far ahead of all other systems of aerial ropeways. It is unsurpassed in tonnage capacity. It is on the principle of "You push the button and the machine does the rest." If interested send for special catalogue.

Our Line of Manufactures includes all kinds of Modern Equipments for the Successful Milling and Smelting of Metalliferous Ores. Special Catalogues on Application.

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 23, 1897.

General trade in all lines is fairly active with a steadily increasing volume of goods going out. The market on nearly all lines continues to firm up. The gold mining industry promises to make rapid progress in 1898, particularly if the production of the new found El Dorado in Alaska and the northern central part of British Columbia is large next spring, and from the general tone of advices it looks now as if it will. Foundry and machine men are quite confident that a larger business will be done in 1898 than has been done in the current year. They look for increased orders for mining machinery, structural material and railroad rolling stock and other material. It is the belief with farm implement manufacturers that orders in their line will show quite an increase on those received the past few years.

We dare venture the opinion that never before were the banking institutions in this city so well fortified with funds. This is evidenced by the taking of the $6,000,000 bond issue of the San Francisco and San Joaquin Valley Railway, the placing of $500,000 shares by the Spring Valley Water Co. and other investments calling for a large sum of money in the aggregate. It is stated that there is a good inquiry for first-class bonds for persons seeking good and safe investment. The call for money for crop-moving purposes is hardly felt, owing to the quickness with which it returns to the general reservoir. The large increase in clearing-house returns shows, more than all else, trade conditions. The East reports a strong movement of currency—gold and silver for crop moving. The large increase over former seasons is making itself felt by stiffening the rate of interest. It is quite generally stated by financial writers at the East that gold imports from Europe are among the certainties. This in the face of heavy imports of raw material and finished products before the Tariff bill became law looks well for the general financial condition of the country.

The British steamer Gaelic, hence September 21st, took out the following treasure: For China, 285,429 Mexican dollars; silver bullion, $132,000; gold, $2215. For Japan, 1948 Mexican dollars. For Bombay, $2200 silver bullion.

New York Silver Prices.

NEW YORK, Sept. 23.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	26⅛	56¾
Saturday	26¼	57¼
Monday	27¼	59⅛
Tuesday	27¼	59⅛
Wednesday	27	58½
Thursday	26⅝	56¾

Refined Silver, per oz.. 1000 fine	56¾
Mexican Dollars nominal	45@46

SILVER.—The market the forepart of the week under review advanced until it sold at 59¼ cents per ounce firm at New York and 27¼d at London. Then it began to set back breaking in two days 2⅛ cents. The advance was due somewhat to a speculative call in Europe with the prospect that India will take more and the Latin countries buy to increase their silver currency. The discussion regarding a strong probability that France would open her mints to silver and the Bank of England would keep one-fifth of its reserve in silver had much to do with the improvement. The decline has been brought about by strong opposition on the part of English bankers to the Bank of England proposition. This opposition seems to have created the impression that it would thwart the move. Aside from this it seems quite likely that the higher price for silver had stimulated the demand for goods from silver-using countries which made a better feeling with manufacturers, for the decline had made exceedingly dull times at Manchester and Lanchester causing a strong plea for international bimetalism. It looks as if the seed has been sowed and sooner or later silver will come to the front.

It is stated by the Japanese newspapers that the Chinese have formed a syndicate and are buying in all the silver obtainable, in anticipation of the adoption of the gold standard after October 1st. It is feared that sufficient silver may be collected, when Hongkong and Singapore are taken into consideration, to purchase all the gold coins minted. The Government is alarmed at this prospect, and is studying to avert the catastrophe. Some advise it to stop the exchange altogether, while others suggest that a restriction should be placed on the aggregate amount of the exchange, and this should not exceed 50,000 yen daily.

MEXICAN DOLLARS.—The market sold up to 46 cents, but with a decline in silver and the China steamer just sailed, there is no demand, making quotations entirely nominal.

COPPER.—The market stiffened slightly for spot at the East, but with no response by futures, it eased off. The demand for the moment is quiet. In reviewing the September market, James Lewis & Son, Liverpool, write: "Trade continues to expand in the United States, and promises to be very active for some months to come. With large shipments of wheat and cotton, freights to Europe have advanced and room for copper is difficult to obtain. The exports of copper are expected to show a considerable decrease during the present month. During July, American production decreased over 5000 tons, the falling off being chiefly in the output of the Arizona mines, though both Montana and the lakes produced less than during the previous month. Imports are 9218 tons greater, and deliveries 2555 tons less, to date than during the same period last year. The total arrivals in England and France for the month have been 9640 tons, and the deliveries 9777 tons fine; stocks have decreased 137 tons, and the visible supply 522 tons. The arrivals in England from Chile during the month have been 1045 and the deliveries 1396 tons fine, and from other countries 6895 and 7897 tons fine respectively. The arrivals here and in Swansea from the United States have been 555 tons bars, 525 tons ingots and 371 tons matte, equal to about 1245 tons fine copper, in London 295, and in France 815 tons fine.

Our market is quoted as follows:

Ingot casting, jobbing..... 13 @—
Ingot " wholesale..... 12½@—
Sheet copper..... — @16½
Bolt.....¼ and 5-16, 20c; ⅜ and larger, 16½

QUICKSILVER.—There were exported the past week 125 flasks to Central America and 10 to New Zealand.

Our market is quoted at $38 for domestic consumption.

LEAD.—The market eased slightly with silver strengthening, but with that easing off it is stiffening again, closing stronger at the East.

Our market is quoted in jobbing lots as follows per 100 pounds:

Pig	5 00	@	5 25
Sheet	6 25	@	6 50
Pipe	5 50	@	6 00

TIN.—The market is practically unchanged. Light weight plate is stronger at the East, owing to manufacturers having light supplies.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing..... —@ 15
Plate, I C coke, heavy, per box..... $4 10@4 25
" " " light, " ..... 4 00@—

SHOT.—The market is firm.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs...$1 40
Drop, B and larger sizes, " " ... 1 65
Buck, Balls and Chilled, do, " " ... 1 65

POWDER.—The market is firm and active.

The market is quoted as follows for Hercules: No. 1, from 11⅞c to 17½c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

COAL.—The market is quite active, with a free consumption. Seattle is weaker, but several kinds of Eastern and foreign are stiffer.

IRON.—The market is fairly firm with a continued free consumption. The east reports irregular but fairly firm markets. The consumption is increasing quite fast.

ANTIMONY.—The market is steady.

Our market is quoted at 8¼c in a jobbing way. New York mail advices quote 7¾c for Cookson's, 7¼c for Hallett's and 7c for Japanese.

NAILS.—The market is firm.

Wire, carloads, basis per keg..... ....
" jobbing, " " $2 45
Cut, carloads, " " ....
" jobbing, " " 2 35

BORAX.—The market is steady.

The market is quoted as follows:

Refined, in carload lots, in barrels	5
Refined, in carload lots in sacks	4¾
Powdered, in car lots	5
Concentrated, "	4½

PLATINUM.—The market is steady.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

ZINC.—The market is firm.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

Chemicals.

While our market does not show any changes worthy of mention, at the East there seems to be a general stiffening in nearly all kinds affected by the tariff. Our New York mail advices report: Crude saltpetre, while in large stock here, was rather more firmly held at 3½c on spot, to arrive or for future shipment in round lots. Nitrate of soda has been sold very recently at as low as 1.60c on spot, but 1.65c is now considered a strictly inside price, and most sellers quote 1.67½@1.70c. Copperas is decidedly stronger. All manufacturers, or nearly all, have raised their prices to 57½c for carloads and correspondingly for smaller quantities, while outside lots seem to be virtually cleaned out. Blue vitriol is stronger on the basis of 3⅝@3¾c for prime quality and in quite good demand. Other chemicals remain steady to firm in price and are meeting with fair movement.

SULPHURIC ACID.—The demand is fair.

We quote in a jobbing way at 1½c per lb for 66°.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported firm from store at 6¼@7c per pound in carboys.

BLUE VITRIOL.—Our market is easier.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is steady.

Our market is quoted in a jobbing way at $1.40 a pound.

BONEASH.—The demand is fair.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

PHOSPHORUS.—The market is firm.

We quote in a jobbing way at 70 to 75 cents per pound.

SODA ASH, 58% (LeBlanc process).—The market is firm at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steady at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA.—The market is steady.

Our market is quoted from store at 4c for 95%.

Mining Share Market.

SAN FRANCISCO, Sept. 23, 1897.

The market has fluctuated to lower figures, unless we except Occidental, which holds to strong figures. In Sierra Nevada and Hale & Norcross there is a latent strength, which is accepted as evidence that the shares are being picked up; yet to better concentrate, the market is often sent to quite low figures, with slight rallies in the interim. A sick, declining market, with quite a line of assessments to collect, invariably causes outside selling, which is taken advantage of by insiders to buy. Although at this writing the market is made to look disgustingly sick, with the blame attempted to be thrown on brokers, yet the better-informed look for much better prices before long. While they are confident higher figures will rule, still they seem to think that to bring it about lower prices must obtain. The general business and financial condition of the United States never pointed to a more prosperous year than is held out for 1898. If this is realized then we can with reasonable certainty look for quite a boom in mining shares. This is also indicated by companies forming at the East and in England to operate in shares of mines located on the Yukon river and its tributaries. Any gamble in them will unquestionably be promotive of larger dealing in the Comstock shares. An attempt is making to attract public attention to a low-grade ore proposition on the Comstock, probably with the view of strengthening reports put out by the inside through their tools, that there is no body of high-grade ore. It is to be hoped that the managements will turn their attention to extracting and milling the low-grade ore, for there are millions of tons, and to go into extensively will call for many hundred miners and mill men and cause a revival in the Comstock, the like of which has not been seen for fully two decades. It must not be understood that low-grade ore mining means a big mining share deal, for this cannot be done unless a body of high grade gold is shown up.

From the Comstock the mines reports continue to come to hand of active work going on from one end to the other of the lode. Some dealers express the hope that with so much activity a body of ore is liable to be found any day particularly in the mines whose shares are well concentrated. It is conceded that milling tests of the low grade ore in Con. Virginia have been quite satisfactory. This, it is said, will cause the Gould & Curry management to follow in the same line with a strong probability that others will fall in line, provided that milling facilities can be had. While extracting and milling low grade ore it is stated that exploiting will not be neglected, but the expense of the latter will be lightened very materially. Official letters on file at the company's office in this city report no change in the work or material encountered in Utah. Rumors are afloat of an improvement cut in Sierra Nevada, but judging from the work it looks as if it is too early for much of an improvement. The work is confined to the Layton tunnel and 900-foot level with no change in the directions reported last week.

In Union they are still drifting south, with porphyry reported in the face. In Mexican the only work reported is in the east crosscrift on the 1000-foot level. On the 1000-foot level in Ophir the west crossdrift is out about 500 feet, with no change reported. On the old Central tunnel level they are still drifting south. No ore was extracted last week from Con. Virginia. Work is being done on the 1550-foot, 1650-foot and 1750-foot levels, but with nothing reported calculated to enthuse shareholders. The work on all these levels is being actively prosecuted. In Andes they are still drifting north on the 175 foot level. The joint work by Best & Belcher and Gould & Curry is confined to the east crossdrift on the 800-foot Bonner shaft level. No work is reported in Hale & Norcross and none expected so long as one set of litigants control the mine and another the office and books in this city. The joint work reported by Chollar and Potosi is confined to repairs in the station and main incline on the 1100-foot level and to the west crossdrift on the 450-foot level. The work by Potosi is confined to the 100-foot level, with no change reported since our last issue. Nothing comes to hand from Bullion. They are still pushing the east crossdrift on the 500-foot level. From Con. Imperial, Challenge and Confidence nothing new comes to hand. The work is on the same levels and in the same directions before reported. Yellow Jacket is a sealed book so far as the public is concerned. The official letters from Crown Point, Belcher, Seg Belcher and Overman are practically the same as reported last week. In the latter mine they are still cleaning out the drift on the 1100-foot level. This, it is said, is the cause of Caledonia advancing. Active work is reported in Alta.

From the Brunswick lode our advices continue to report active work, with expected big things still ahead. It is one of the best rainbow-chasing schemes yet reported to keep interest alive. In Occidental the ore found on the 650-foot level is sufficiently encouraging to renew work on the 750-foot level so as to take the downward continuation. It will take from eight to twelve days yet before a crossdrift can be started. Reports are afloat that the ore in crossdrift No. 1 on the 650-foot level is about $10 and 14 feet wide; in the other it is wider and richer. In about ten days they will start another crossdrift farther south. In Chollar work is confined to the 300-foot, 400-foot, 500-foot and 600-foot levels. Connection has been made between the two last, which will admit of active and more en-

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from N. B. Willits, et als., in the Willow Placer Extension, near Howard's Station, Sierra Co., to deposit tailings in Little Deer creek; from G. A. Rosenthal, et als., in the California Mine, near Sierra City, Sierra Co., to deposit tailings in east fork of North Fork of Yuba river; from Jacob Yager, in the Schneider Diggings, near Spanish Ranch, Plumas Co., to deposit tailings in Spanish creek; and from Henry A. Hallsted, in the Hallsted placer mine, near Spanish Ranch, Plumas Co., to deposit tailings in a ravine, gives notice that a meeting will be held at room 59, Flood building, San Francisco, Cal., on September 27, 1897, at 1:30 P. M.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from Horace Taber, in the Taber Gold Mining Claim near Gibsonville, Sierra Co., to deposit tailings in Gibson Creek; from Fred Smith, in the Black Oak Mine near Yankee Jim's, Placer Co., to deposit tailings in Owl Creek; from W. H. Leek et als., in the Miocene Mine near Crescent Mills, Plumas Co., to deposit tailings in Rush Creek; from Henry Conbrough, in the Ellrig Mine near Carbondale, Amador Co., to deposit tailings on a flat; from John C. Murphy, in the Slate Creek Placer Mine near Kelsey, El Dorado Co., to deposit tailings in Dutch Creek; from John M. Jackson, in the Jamison Placer Mine near Johnsville, Plumas Co., to deposit tailings on a flat; from Sook Hung Lung, in the Barnard's Diggings near La Porte, Plumas Co., to deposit tailings in Slate Creek; and from the Jupiter Gravel Mining & Water Co., in the Jupiter Gravel Mine near Dogtown, Calaveras Co., to deposit tailings in San Domingo Creek, gives notice that a meeting will be held at room 59, Flood Building, San Francisco, Cal., on October 11, 1897, at 1:30 P. M.

Skeleton Mining Report.

NEEDED BY EVERY MINING MAN.

FIFTY CENTS POSTPAID.

Mining and Scientific Press, 330 Market St., S. F.

ergetic exploiting work. Nothing new has come to hand regarding the two crossdrifts in the 600-foot level, and nothing is expected for a few days yet. They are shipping ore to the mill. From the other levels nothing of an important character is reported. Considerable interest is taken in the joint work being done by Gould & Curry, Best & Belcher and Con. Virginia, but it looks as if more time will be required to show up something than is expected at present. From Savage nothing new is reported in the official letter.

The following illustrates the changes of the week:

Commercial Paragraphs.

THE Colorado Iron Works Company, Denver, Colo., report the shipment of two carloads mining machinery to Kilton Gold Reduction Co., Florence, Colo.

THE Paraffine Paint Co., 116 Battery street, San Francisco, R. S. Shainwald, secretary, has declared a dividend, No. 25, twenty-five cents per share, payable Sept. 29th.

WM. AINSWORTH of Denver, Colo., is now offering for sale a weight, as shown above, of 294.6 milligrammes, which was suggested and first put into use by Mr. Chas. F. Shelby, assistant chemist at the Globe Smelting & Refining Co.'s Works at Globeville, Colo., and which is coming into general use very rapidly. Its use is to facilitate the present volumetric method of manganese determinations, where the titration is done with the standard 1% permanganate solution for iron. By taking this amount of ore, the final results read from the burette, 1 c. c. equals 1%, thereby saving all further calcinations and reducing the liability of mistakes to a minimum. Made of platinum and weight guaranteed. For further particulars regarding this weight address Wm. Ainsworth, maker, Denver, Colo.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

Assessment Notices.

RED CAP MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Red Cap Creek Humboldt County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 25th day of August, 1897, an assessment (No. 1) of Nine Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, No. 125 Beale street, City and County of San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 1st day of October, 1897, will be delinquent and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 23d day of October, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. deK. TOWNSEND, Secretary.

Office—125 Beale street, City and County of San Francisco, California.

SAVAGE MINING COMPANY. LOCATION OF principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees, held on the 2nd day of September, 1897, an assessment (No. 93), of 20 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, No. 309 Montgomery street, Room 50, Nevada Block, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 5th day of October, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of October, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

E. B. HOLMES, Secretary.

Office—No. 309 Montgomery street, Room 50, Nevada Block, San Francisco, California.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia City, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of September, 1897, an assessment (No. 44) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, rooms 20-22 Nevada block, 309 Montgomery street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 4th day of October, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of October, 1897, at 1 o'clock P. M., to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Rooms 20-22, Nevada block, 309 Montgomery street, San Francisco, California.

FAIRFAX VILLA COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fairfax, Marin County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 10th day of September, 1897, an assessment (No. 7) of Fifty Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 56, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of October, 1897, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the 8th day of November, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD, JR., Secretary.

Office—Room 56, No. 309 Montgomery street, San Francisco, California.

ALTA SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 3d day of September, 1897, an assessment (No. 57) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to to Secretary, at the office of the company, room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of October, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 27th day of October, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

J. E. JACOBUS, Secretary.

Office—Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Assaying Gold
.....AND.....
Silver Ores.

By C. H. AARON.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Perface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay: Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Gessay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price $1.00 postpaid. Sold by the **Mining and Scientific Press**, 330 Market St., San Francisco.

DELINQUENT SALE NOTICE.

OSBORN HILL GOLD MINING AND MILLING Company. Location of principal place of business, San Francisco, California; location of works, Grass Valley, California.

PATENTS

DEWEY, STRONG & CO'S
PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'S Patent Agency will have the benefit of a description in the *Mining and Scientific Press*. We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

DEWEY, STRONG & CO.,
PATENT AGENTS,

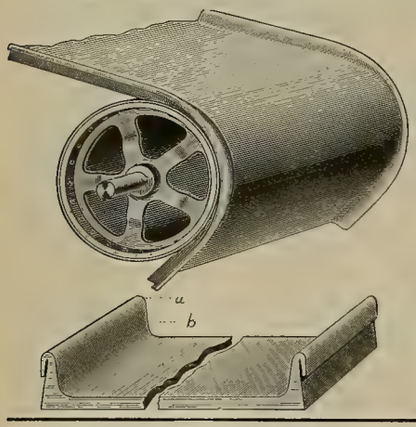
THE BROWNELL "PATENT LIP" FLANGE FRUE VANNER BELTS.



It has taken years of ceaseless testing and experimenting to produce the superior belt which we now offer, with elastic flanges and pliable body reinforced with specially woven duck. Every belt is manufactured by experienced workmen, and carefully tested on machines especially built for that purpose; consequently we are to day manufacturing the best belts that mechanical ingenuity, combined with honesty of construction, can possibly produce.

RAWHIDE GOLD MINING COMPANY.
JAMESTOWN, TUOLUMNE CO., CAL., Feb. 21, 1897.

J. S. BROWNELL, ESQ.—DEAR SIR: Replying to your query of Feb. 15th, will say that I have used your Patent Lip flange belt more than one year, and judging from their appearance after more than one year of hard service, I do not hesitate to say that they are the best belt I have ever used and I take great pleasure in testifying to the fact. Yours truly, W. A. NEVILLS, President.

AMADOR CITY, CAL., Feb. 18, 1897.

MR. J. S. BROWNELL—DEARR: I take pleasure in saying that I have used your Patent Lipped flange belt for several years while connected with this company, and I consider them the best that we have used. The quality of rubber in the flange seems to be the best, and we are not bothered with the flange cracking and thereby destroying the life of the belt. At present we are using 14 concentrators, and have in use several kinds of belts. We consider your Patent Lipped flange the best. Yours very truly, THE CONS. SOUTH SPRING HILL G. M. CO.
By JOHN R. TREGLOAN, Superintendent.

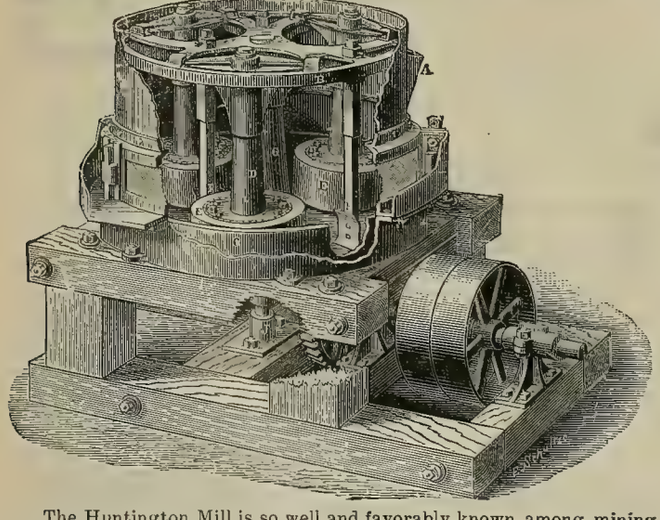
Room 610, 330 MARKET ST., - - - SAN FRANCISCO, CAL.



The Huntington Mill is so well and favorably known among mining men throughout the world that any description of it would seem superfluous. They are in use in the United States, Canada, Mexico, Central and South America, Australia, China, Japan and South Africa—in fact, wherever mines exist, and have given the best satisfaction of all quartz-crushing mills. The construction of this Mill has lately been much improved and we claim it to be the cheapest, most efficient, simplest and most durable Mill upon the market. Catalogue upon application.

PARKE & LACY CO.,

21 and 23 FREMONT STREET, SAN FRANCISCO, CAL.

LICENSEE FOR THE MANUFACTURE AND SALE OF

THE

Huntington Centrifugal Roller Quartz Mill,

AND THE

Ropp Straight Line Furnace

—FOR—

Roasting, Chlorinating and Desulphurizing Ores.

WE CARRY IN STOCK

Cal State Library

Portal, Vertical and Portable Engines and Boilers,
Rock Breakers, Rolls, Pulverizers, Concentrators, Ore Feeders,
Hoisting Engines, Horse Powe... Lifting Whims, Water Wheels, Steam Pumps, Ore Cars, Wire Rope, Ore Buckets, Water Buckets, Skips,
Blowers and Exhaust Fans, Shafting and Pulleys, Belting, Oils and Mine Supplies.

SOLE AGENT FOR THE

Ingersoll-Sergeant Air Compressors and Rock Drills

—AND—

Manganese Steel Shoes and Dies.

Estimates Furnished for Complete Plants for Hoisting Wo ks Smelters, Concentrators and Stamp Mills.

Deep Mining in California.

"The mines go down but the miners do not," is still said of some localities where it is held that deeper development would bring good results. That cannot be said of California, it having long since been shown that in this State the quartz veins hold as depth is attained. From Nevada county this week comes a statement that at the Providence mine, one of California's big gold producers, will shortly be begun a new shaft below the 1780-foot level, hoisting and pumping machinery to be put in capable of carrying it down 1000 feet. In this regard the extract on page 312 of this week's issue, regarding permanence in depth of ore bodies in that vicinity, is of interest. What an advance in scientific mining there has been since the announcement in these columns, many years ago, referring to this very Providence mine, that the MINING AND SCIENTIFIC PRESS would give $5000 for some satisfactory process to successfully extract the gold from the sulphurets! Since then, chlorination, the practical invention of a Californian, has solved that problem. These sulphurets make up from a fraction of 1 per cent to 10 per cent of the quartz mined, and contain from $30 to $100 or $200 per ton. The veins of the Providence-Gold Tunnel system are of interest and economic importance. They have in general a direction ranging from north-northwest to north-northeast and a uniform easterly dip of from 35° to 45°. A peculiar radiating arrangement is clearly noticeable, all of the veins converging toward a point a short distance west of the Fortuna mine. The westerly veins of the Providence system begin with the Mountaineer, which for many years has been a heavy producer. At the Providence mine the vein leaves the slate and enters the granodiorite. South of Deer creek, in the Providence mine, the vein is extensively developed by a shaft 1800 feet deep on the incline. The vein is characterized by heavy masses of quartz, up to 10 feet wide, and contains much sulphurets; there is also a considerable percentage of silver in the ore. The granodiorite on both sides of the vein is usually greatly broken and crushed, and is traversed by numerous seams parallel to the vein. Sometimes the crushing has gone so far that the rock is converted to a schistose, chloritic mass. In certain places there are two or more veins, separated by zones of crushed granodiorite, the whole mass "between walls" attaining 30 feet in width. To the south of the Providence mine, beyond the point where the vein enters slate, the old underground works, not accessible now, showed the vein to follow the contact for about 800 feet on the incline.

Of this, Waldemar Lindgren, in "Nevada City District Geology," says that the contact vein to the west of the Merrifield, its southerly part parallel to it in strike and dip, is first seen at the Providence mine, where a rich pay chute has been opened on it. It is also extensively worked on the Champion ground, as well as at the old and new Nevada City shafts. Near the latter it turns rather suddenly, without break, to a west-northwest direction. It has not been opened extensively to the west of the Nevada City mine. Practically the whole southerly part of the vein lies on the contact between granodiorite and slate. About 500 feet south of the Nevada City new shaft it leaves the contact and enters the granodiorite. It is usually a wide vein, heavily sulphureted—even more so than the Merrifield—carries considerable silver, and shows abundantly the same indications of an extensive overthrust fault fissure, the throw of which must be larger than that of the Merrifield. A short distance south of the Providence ore chute it runs into a diabase exposed on the sixth level and slate, and closes down to a mere seam. The fissure has a strong tendency to throw out stringers and fissure in the slate footwall; these have generally a flatter dip than the main fissure. Several such veins and stringers are seen in the Providence mine. A shaft near the Wyoming mill has been sunk on such a vein, which is found to unite with the contact vein. The northerly Wyoming shaft is sunk 900 feet on the incline on a slate vein, which in depth will probably be found to unite with the contact vein, as it does on the strike near the old Nevada City shaft. Between Indian Flat and Deer Creek the schists contain a great number of seams, mostly dipping southwest from 10° to 40°.

Deep mining has been the rule throughout many California sections for several years. In the same county—Nevada—and within a comparatively small area are a number of deep workings. The Empire mine contains two veins, Rich Hill and Ophir Hill, the principal work having been done on the latter, on which a shaft has been sunk to a depth of 2400 feet on the incline. The vein is from 1 to 1½ feet thick and frequently contains coarse gold. The sulphurets amount to 2½ per cent. The ore is high-grade and for many years averaged $25 per ton.

GOLD DREDGER IN YUBA RIVER, CAL.

GOLD DREDGER IN YUBA RIVER, CAL.

A California River Dredger.

In the issue of Sept. 4th appeared a short history of river dredging for gold and a technical description of a dredger being built by R. H. Postlethwaite on the Yuba river, Cal. Herewith are presented two views of the machine, from photos taken for this paper by Griffiths of Marysville, which give a general idea of the machine as it now lies in the Yuba river twelve miles from Marysville and six from Smartsville. The dredger herewith illustrated is the first one of the kind built in the United States, and is evolved from thirty years' costly experience in dredge building. As it lies, complete, it has cost about $25,000. Two pontoons, each 96 feet long, 9 feet breadth of beam, are connected by a third one 17x5 ft., making one boat 96x23 with a 5-foot well-hole 75 feet long in the center. The capacity of the dredger approximates 2200 cubic yards per twenty-four hours.

THE usual complaint is made about the bad roads in some of the mining districts in this State, notably Calaveras, Tuolumne and Amador counties. With the winter rains the same state of affairs will exist as did last winter, when supplies and machinery were delayed months and nearly all improvement stopped by reason of physical impossibility to go over sundry Chilcoot passes in that region. Such negligence is costly. California has lost many millions by this lack of proper action. The remedy lies in the county boards of supervisors. It is for the mine owners and working miners who annually lose money to see that capable, honest men are elected. "What is everybody's business is nobody's business" has prevailed to a distressing extent. The local needs are too often disregarded. To catch "the Austrian vote" or "the Italian vote" or some other vote is doubtless of surpassing importance to sundry local politicians, and little matters like the selection of county supervisors are of no consequence to men who have the making of mighty men like sheriffs and county clerks. It is an annual loss to the commonwealth that such miserable apologies for "roads" exist, and an annual loss to those most directly affected, and who can remedy the fault whenever they feel like doing so.

MINING AND SCIENTIFIC PRESS.

ESTABLISHED 1860.

Oldest Mining Journal on the American Continent.

Office, No. 330 Market Street, San Francisco, Cal.
Telephone Number: Clay 204.

ANNUAL SUBSCRIPTION:

No one is authorized to solicit business for this paper unless in possession of proper credentials and regularly numbered and stamped blank subscription receipts.

San Francisco, October 2, 1897.

TABLE OF CONTENTS.

ILLUSTRATIONS.—Gold Dredger in Yuba River, Cal.; Gold Dredger in Yuba River, Cal., 309.
EDITORIAL.—Deep Mining in California; A California River Dredger; Bad Roads in Mining Districts, 309. Some Resultant Losses; Revision of Mining Laws; Important If True, 310.
ELECTRICAL PROGRESS.—Electric Metering from the Station Standpoint; Wireless Telegraphy; An Electric Plant in the Cœur d'Alenes, 316.
MECHANICAL PROGRESS.—Boiler and Flywheel Compared; To Canvas Cover a Pulley, 316. Inventions Ahead of Their Time; A Magnetic Drill; To Furnish Aluminum Discs and Pins for Bench Marks, 317.
SCIENTIFIC PROGRESS.—The Eastern Arctic Sea; Climbing a Staircase or Ladder; Premature Burials; Chemical Composition of Fire Damp; Total Eclipse of the Sun; Cold Stove for Heat, 317.
MINING SUMMARY.—From the Various Counties, of California Nevada and Other Pacific Coast States and Territories, 318-19.
THE MARKETS.—Eastern and Local Markets; Mining Share Market; Sales in San Francisco Stock Board; Notices of Assessments, etc., 330.
MISCELLANEOUS.—Concentrates, 311. New Publications, 312-17. Gold in Dutch Guiana; It Rained Pebbles; Georgia's Bauxite Mines; $33 for One Apple; The Cyanide Process, 313-14. Mining Law Amendment; One of Their Questionable Methods; Employment at Woolwich Arsenal, England; A New Diving Bell; British Comment on American Mines; The Total Length of the World's Telegraph System; An Examination for Color Blindness, 315. Personal; Commercial Paragraphs; Recent California Mining Incorporations, 317. Coast Industrial Notes; Recently Declared Mining Dividends, 320. List of U. S. Patents for Pacific Coast Inventors; Notices of Recent Patents, 331.

Important If True.

A Washington dispatch says that Secretary of the Interior Bliss is about to announce a new ruling regarding placer locations, namely, that one discovery within the limits of 160 acres entitles one individual to location of that area. The statement is not yet confirmed; but if it be true, the result will be of great benefit to many forms of placer mining, more especially the drift mines of California.

As construed by Secretary Bliss' predecessor, the individual was required to make a discovery on the twenty acres of placer location he was permitted to take, and a discovery demonstrated upon each twenty-acre tract included in the placer location of 160 acres; and a location made of such amount of land upon a single discovery was void except as to the twenty acres immediately surrounding it. It is believed that the ruling of Secretary Bliss, if authentic, will tend to lessen expense in the matter of drift mining. Under Secretary Smith's administration, there was constant trouble by reason of his rulings. Those familiar with California drift mining know that the value of such property lies entirely in gravel beds which are covered deep by volcanic rock. Secretary Smith ruled that there must be a discovery of mineral upon each particular claim. Just how to make a discovery of mineral upon each particular claim, except at an enormous expense, was, under that ruling, a matter of difficulty to California drift miners. Unlike ordinary placer locations, it is impossible for the drift miner to tell just where his claim should begin; it is also difficult to decide whether the valuable gravel will lie deep under one part or another of the volcanic capping. The surface area of such claims is of no value whatever. Costly tunneling for hundreds of feet can alone determine where the gold-bearing tunnel of the ancient channel lies. Under Secretary Bliss' alleged ruling the drift miner will have a chance compared, as heretofore, of eight to one.

It is interesting, in this instance, to note that two Supreme Court decisions are in line with the most recent assumption. The Supreme Court of California, in the case of Gregory vs. Hirschbacher, 73 Cal., 109–119, says: "It is insisted by the counsel that no location of mineral land is valid unless valuable mineral has been actually discovered on the land before the location was made. As to placer claims, we find no such condition in the acts of Congress, in the local laws or in the practice of miners." In the case of McDonald vs. the Montana Wood Co., the Supreme Court of Montana has held that a single placer discovery within the limits of a tract of 160 acres located by an association of eight persons is sufficient upon which to base the location of the entire tract. Of course in the granting of a patent such State decisions may yield to the dictum of the General Land Office and it is a source of congratulation to placer miners that the Department of the Interior seems disposed, under the present administration, to take a broader view of these matters than heretofore. Much, of course, may be said in favor of such governmental rulings, and argument could be put up on the general assumption that because some certain twenty-acre tract within a 160-acre area is mineral in character it could not be inevitably concluded that similar adjoining tracts were of the same character.

It would seem as though some one who had some knowledge of practical mining, or who had at some time got outside the governmental building at Washington, had access to the attention of the present secretary, who is to be commended for the intelligent attention bestowed on these matters since his induction into office. The last ruling—if ruling it is—comes in direct line and is consistent with another ruling which is, that in the case of placer locations $500 expended in work on an entire 160 acres is sufficient to secure before the Land Department patent to such area.

Some Resultant Losses.

In the issue of this paper of the 11th ult. was a practical suggestion that California farmers were themselves considerable losers by the stoppage of hydraulic mining in this State, and this matter of debris was one that could, with justice, be discussed. The item has been the subject of editorial comment by Valley papers; some unnecessarily taking the hostile attitude that opposition was assumed and must be met; winding up with the old story of firesides, sacred altars, the old flag, and an appropriation, etc.

The suggestion made in this paper was a business one and deserves to be discussed in a business manner. It is not anything for hysterics or sentimentalism, but is deserving of practical discussion in a kindly way. It is safe to accredit ordinary intelligence to anyone discussing the matter from the miner's standpoint, we being always willing to concede the same amount of consistency to others that we claim for ourself. As this subject has been opened up in the manner indicated, it is in order to adduce some statements of facts, the sources being official government reports and statements from the anti-debris association. Annual reports from the chief engineers estimate the amount of debris lodged in the Sacramento drainage system as being 1,314,000,000 cubic yards. During the twenty-one years of hydraulic mining from 1860, when it began, to 1881, when it ceased, except under certain limitations, it has been figured that about 21 per cent of the amount of debris is due to the work of the hydraulic miner, the assumption being that the other 79 per cent was due to natural erosion and the general result of civilization and agricultural progress.

The present condition of the Sacramento river—of which so much has been said and sung—while unsatisfactory to miner and farmer alike, is not chargeable to the miner. It is a common custom of rivers to so build up their channels as to make the surface of the water higher than the surrounding country, from which it is restrained by dykes. Tremendous results of long-continued natural erosion are manifest in nearly every navigable river; and in the case of the Sacramento and San Joaquin valleys, their geological history has an important bearing upon this question. Long before miner or farmer saw California the Sacramento had built up a channel, and will continue, after the fashion of the Missouri and the Po and other streams, until some topographical convulsion changes it. In such upbuilding cultivation has hastened the present condition, and the hydraulic miner has contributed some. Unless mining can be held responsible for the settlement of the valleys and the wash in the cultivated hillsides, it cannot be justly charged against the mining industry that navigation facilities on the Sacramento have lessened. But if mining be responsible for all this, then should be set down to the credit of mining the difference between California as a whole in '47 and '97.

The loss in the last seventeen years from the closing of hydraulic mining is very great. It has been estimated that but for this the gold production in this State would have been 75 millions more than it is. The depreciation in value of the property and equipment of the hydraulic miners has likewise been estimated at an equal amount, the loss to industries indirectly connected as much more; and the loss to local agriculture and to the farmers is best illustrated by the clamor heard of overproduction and want of consumption on the part of those who grow fruit, vegetables, etc. United States engineers estimate the loss to the farmer through debris at about $3,000,000; the loss to product and the loss to sympathetic industries amount to a great deal more, and direct and contingent with the agricultural interest through the years aggregate $40,000,000.

From the same official reports and the table of estimates of debris raised in California drainage channels, it appears that about 8 per cent lies in the Sacramento river and the Feather river below Marysville. Estimating that one-fourth of this comes from the mines, it would appear that about one-fiftieth of the debris excavated from the mines finds lodgment therein. At the rate of annual wash in 1880, that would raise the channel 1 foot in thirty-eight years. These figures, which are believed to be accurate, sufficiently illustrate the fact that, while there has been a loss on both sides, the loss by the cessation of hydraulic mining has inured to the injury of the State, affecting all residents alike; and that undeserved odium and exaggerated prejudice have diverted public attention from the true facts.

The miner is not desirous of evading his full measure of responsibility, nor of instituting a quarrel with the Almighty, or with the forces of Nature; much less is he desirous of other than the most cordial relations with his neighbors, friends and fellow citizens; and inasmuch as the meaning of the item referred to has been distorted and unwarranted hostile deduction drawn therefrom, it is but deemed just to make this further reference to a very important question; one that has worked to the direct injury of the commonwealth. Only by friendly counsel and cordial co-operation by all can adequate aid be secured, and holding post mortems is less beneficial than earnest, united effort to better present conditions.

Revision of Mining Laws.

The committee on revision of the mining laws of the United States, appointed by the Denver Mining Congress last July, met in that city on the 23rd ult., and formulated some suggestions which are being embodied in a report. It is believed that members of the committee not present will coincide with the views of those who took part. It is intended that the next meeting of the committee will be held in Washington, D. C., in the closing days of '97.

There was throughout a unaminity of opinion that the ideas suggested in the MINING AND SCIENTIFIC PRESS on this important matter be acted upon affirmatively. Indeed, more radical suggestion found almost unanimous favor, namely, that it were easier to secure such legislation than to attempt any patching of the present Federal statutes; the idea being to secure the development of the mines of the country with full protection to the miner, and at less cost.

Among the topics discussed were the doing away of the apex law, the fixing of an annual fee in lieu of assessment work at the option of the claimant, until such time as the patent is granted; the idea being that if the owner or operator is confined to the surface lines the claim should be of such a size that one claim should be sufficient, the claim to be 1320 feet square, in place of, as at present, 600 by 1500 feet. It is claimed that in a location of the size recommended—namely, forty acres—where the vein is located in the center of the claim and has a dip of 45 degrees, it would give the owner between 800 and 900 feet on the vein, the distance increasing as the dip of the vein approaches the perpendicular. In this regard it has been suggested that claimants be permitted to take up as many claims as they can afford to pay for.

The matter of adverses was also discussed, the idea being to have none in the proposed law, as

where filing is permitted by the local land office those questions which have heretofore made adverses and such like litigation possible, would be eliminated; the tenure of the claimant depending upon his payment of the annual fee and the performance of the required amount of work, on failing to comply with the law, his claim being vacated, thus no adverse proceedings being necessary. The idea of abrogating the tunnel site law was unanimously agreed to; and the important question which is referred to on this page in this issue under the head of "Important if True" was also further discussed, that matter being left in abeyance.

Regarding the status of the present holders of claims, in event of the passage of such new mining law, it was thought that they should be given until January 1st, 1900, to prosecute their claims to patent; and in the event of their failure to do so, the claims to revert to the Government without recourse.

Regarding placer claims, it was thought by the committee that due regard to all requirements favored the enlargement of the law to cover a wider extent of minerals than the most favorable official interpretation has yet considered.

A report of the public land commissioner in 1879 recommended the wiping out of the present Federal mining laws; and that official drew up a bill to be presented to Congress to construct an entire new code of procedure. This bill has been made the basis of the committee's report, with up-to-date ideas and practical suggestions from prominent mining men all over the country. The necessity for such a change has gone beyond the domain of argument, and it is generally understood and agreed that some radical change in the present Federal statutes regarding mining are made mandatory by the situation. Some additional phases of this matter are referred to by a leading Colorado miner on page 315 of this issue.

In this regard may be mentioned the article by Elliott Lord in the fourth monograph of the United States Geological Survey, in which the statement is made that from 1860 to 1865, inclusive, $9,000,000 were expended in litigation on the Comstock lode, Nevada, which was one-fifth of the total product of the mines and more than was paid in dividends in that time. Senator Stewart—who, on this subject, is an authority—estimated the amount so spent at over $10,000,000. Mining is costly enough at best without such an enormous burden, which the miners have been carrying for many years, and it is getting no better very fast. This subject will doubtless receive due attention at the hands of the convention of the California State Miners' Association which meets in this city on the 18th inst.

Concentrates.

AN application for a patent may embrace several locations.

PLATINUM is reported discovered at Pine Ridge, Fresno Co., Cal.

GEORGIA'S deepest gold mine is the Franklin, Cherokee Co., depth 350 feet.

IN Colorado the basis for mine taxation is one-fifth of the total output reported.

WAGES in the Enterprise mine, Slocan, B. C., have been cut from $3.50 to $3 per day.

AT the Spanish mine, Nevada Co., Cal., ore yielding 85 cents per ton has been worked at a profit.

THE California Debris Commission will pass upon applications for hydraulic permits on the 22nd inst.

COPPERAS is now a by-product in the manufacture of iron wire and is quoted at from 60c to 70c per 100 lbs.

SUPT. DALY, of the Daly-West, Park, Utah, mine, says work will not resume there till silver reaches 70 cents.

THE Eagle Bird mine of Maybert, Cal., which produced $900,000 in twelve years, is to be started up again.

RAND, South Africa, white employes average $5 per day; Kaffir wages, 69 cents per day, including "board."

THE insurance on the Iron Mountain property, recently destroyed by fire near Keswick, Cal., aggregated $80,000.

THE San Francisco Mint charge for foreign recoinage is $1 for 1000 ounces, making it much cheaper than exchange.

OSMIUM, sp. g. 22.5, is believed to be the heaviest known substance; lithium, sp. g. 0.59, the lightest metal known.

AT 55¾ the bullion, or, as our Eastern friends say, the "intrinsic" value of the standard silver dollar is 42.92 cents.

LESS than 90 days remain in which to do needed assessment work on unpatented mining claims for the calendar year 1897.

SINCE the Klondike excitement began Australia has sent six times the amount of gold to this city that the former has.

THERE will be 3000 extra copies of next week's edition. That is, in addition to the regular issue 3000 more copies will be printed.

AT the Spokane, Wash., meeting on the 8th inst. the Le Roi, B. C., mine will exhibit a 3400-lb. ore specimen from the 500-ft. level.

A CO-OPERATIVE mining company, if the partners stick together, has the strength of the game, and, rightly managed, will usually win.

ASPEN, COLORADO, reports that the Mollie Gibson and Argentum-Juniata will build concentrating plants to treat their low grade ore.

IT is expected at Leadville, Colo., that the pumps in the mines will soon be started and within two months 2000 men will be put to work.

GOLD 750 fine is worth $15.50 per oz.; 800 fine, $16.53 per oz.; 850, $17.57; 875, $18.08; 900, $18.60; 920, $19.01; 930, $19.22; 940, $19.43; 950, $19.63.

FROM Jan. 1st, '93 to Sept. 1st, '95, the gross receipts from the Utica and Stickles mine, Calaveras Co., Cal., were $4,154,026.52; expense, $1,683,414.24.

IN the convention of the California Miners' Association on the 18th inst., each county organization is entitled to one delegate for every ten members.

WITH silver at 60 cents and lead at $4.25 the silver lining would be restored to the cloud that hangs over the silver-lead mines of the west half of America.

TO REDUCE a one per cent cyanide solution to ¾ of 1% use 3 ozs. solution to 1 oz. water; to ½ of 1%, 2 ozs. solution to 2 ozs. water; ¼, 1 to 3; ⅛, 1 to 7, and so on.

THE Slate creek, Wash., boom of July, '95, is being repeated. One Montana syndicate then spent $50,000 to no purpose, and 3000 prospectors cursed the country.

URANIUM is worth 60 cents per gram. A specimen of ore believed to contain it might be sent to the State Mining Bureau in San Francisco for qualitative analysis.

ANY one in rightful possession of a placer claim is entitled to everything inside his boundary lines. No one can, without permission, prospect or locate a lode claim therein.

NEW YORK CITY men have bonded the Baisley-Elkhorn quartz mine, fifteen miles from Baker City, Or., for $50,000. Supt. O. R. Symmes will increase development work, etc.

ON page 320 of mining summary will be found a report of recent South African cyanide working, of prime importance to every cyanide worker, more especially to those operating in localities where water is none too plentiful.

THE 43rd dividend of 6 cents per share has been declared in the Western Silver Mining Co., Tasmania. The total amount of the dividend is $3750, and the total sum of dividends to date is $420,000.

THOUGH talk of "tons of gold" from the Klondike has subsided, it is interesting to recall the fact that from one mine in Nevada—the Con. Cal. & Va.—have been extracted 119 tons of gold.

THE records show the highest temperature ever recorded in California was 130 degrees, at Mammoth Tank, in the desert region of San Diego county, and 128 degrees at Indio, in the same county.

KLONDIKE gold runs about 700 fine; California gold goes sometimes as high as 925 fine. Probably the purest native gold is from the Mount Morgan, Australia, mine, which has gone as high as 987.

B. W. RICE of Milford, Utah, has filed the first papers toward getting a patent on a flour-gold machine. The principle is just exactly contrary to that existing in the mind of every old-time placer miner.

IN the far north silver is at a premium. At Skaguay silver is so scarce that a twenty-dollar gold piece has been given for nineteen silver dollars in change. In San Francisco in the early 70's the same condition prevailed.

THE report of the Geyser-Marion, Utah, superintendent for August shows that the company is daily putting out 150 tons of low grade ore. It is being taken from the mine and converted into cyanides at a cost of less than $2 per ton.

THE New York company advertising a dry washer "to be used in the Klondike country" is actually securing sales of stock in the country round about Manhattan island. "Succor for the Klondike" could be there reversed to "Klondike for the sucker."

THE gold crushings at Witwatersrand, South Africa, for August, '97, aggregated 259,603 ounces, an increase of 17,124 ounces as compared with the previous month's total, and an increase of 46,185 ounces as compared with the corresponding month of '96.

AUSTRALIAN miners have a variety of markets for their gold. New Zealand deals with San Francisco, Sydney or Melbourne; Westralia with London or Melbourne; New South Wales with Sydney, San Francisco or London; Victoria with Melbourne.

LABOUCHERE of London continues to make the surprising statement that nearly every journal in that city can be financially induced to say anything, editorially or otherwise, in any part of the paper about any mining property anwhere, which is probably an exaggeration.

IN case J. H. Neff, the present honored president of the California State Miners' Association, should decline to further serve, it is believed that H. T. Power of Sunny South, Placer Co., would be good timber for that position. The name of Mr. Edward Coleman of San Francisco is also prominently mentioned.

ASSESSMENT work on claims is estimated by the day's work at the ruling local rate of wages. No decision permits trail or road work to apply on the required amount of annual work or improvement. Work must be on the claim or in direct relation to it. No allowance is made for time or money spent going or coming.

A MINING company has been organized in Eureka, Cal., for black sand mining on the beach at the mouth of Little river. Four thousand dollars' worth of machinery has been purchased and eighty-eight acres leased. The plant will work 800 tons of sand every twenty-four hours, averaging, it is said, 80 cents per ton.

NOVEL reasons for lowering miners' wages are sometimes advanced, a more than ordinarily curious one being given by G. W. Lock, manager of two large Australian mines, who says that he reduced wages throughout because gold ore was being stolen—a case where the innocent were punished and the guilty encouraged.

THE Prescott, Arizona, *Courier* thinks the best use to make of authentic mining news "is to give it first to the local paper, which goes to the metropolitan publications, which latter, in turn, will republish such local news, giving the local paper credit therefor, thus more fully establishing the authenticity of the news."

THE prevalent newspaper desire to announce wonderful mining "strikes" causes some funny statements. One Missouri paper has locally found a "porous mineralified clay," and says, "judging from its appearance, if found in a mining country, this clay might contain any kind of mineral." Yea, verily, and then, again, it might not.

THE record of ore shipments from southern Kootenay, B. C., for the week ending Saturday, September 18, was the largest ever known. The value of all ores and matte entered at Nelson for the week was $271,018, the total value of shipments for September up to date $500,387. The value of the mineral exports for the current year to September 18 is $5,540,243.

THE electric dredge on the Kowarau river, New Zealand, made a return of 958 ounces in gold recently. The owners of this dredge are reported to have obtained gold to the value of £17,000 as the result of their first year's operations, with the work of seven men and an initial expenditure of £4500. The company has lately finished the construction of a second dredge.

THE Tucson *Citizen* says that the recent Arizona legislative enactment compelling the University assay office to make gold and silver assays for 50 cents each, virtually closed up the assay offices in that city. From 400 to 600 assays per month are made at the University, while the assay offices in town do not make a dozen. The law is unjust and should be repealed.

IT is about time for the annual fakir with his "souvenir," "official" programme of the California State Miners' Association to begin begging and coaxing manufacturers and vendors of machinery to take advertising space therein. The advertiser and his competitors may see the few dozen copies printed, but no one else will, and any money contributed to the thing is so much thrown away.

DURING the past five years, particularly in the last eighteen months, a great amount of space has been devoted herein to the cyanide process, or rather processes, so much that, probably, no where outside of the files of this paper can be found so much of the best thought and results of work on the part of those who, in this branch of progressive metallurgy, have given intelligent investigation of so important a subject.

WARDEN McDONALD of Charters Towers, Queensland, reports that forty cyanide plants are now being worked and others are in course of erection. For the three months ending June 30th: Ore crushed, 49,948 tons; yield, gold, 59,805 ounces; tailings treated by cyanide, 46,004 tons; yield, 21,391 ounces gold; tailings treated by chlorination, 1742 tons; yield, 2329 ounces; making in all 97,694 tons of material treated; total yield, 83,525 ounces.

THERE is a rich-looking quartz ledge running through the heart of the town of Placerville, Cal., says the *Nugget*, but until recently it was supposed to be held under a patent. A young lady named McConnell, living near the croppings, noticed a mining expert taking bearings as if about to locate the ledge, went down town and bought a location notice and had her claim recorded before the expert had his measurement completed.

THE question as to whether or not Canada should have a mint and make coins of gold, silver and copper is to be one of the issues of the coming campaign in British Columbia. British Columbia had a mint in 1877. It was located in New Westminister and after striking off a few $5, $10 and $20 it was closed by the late Sir James Douglas, Governor of the United Colonies, because he thought that would allay the intense jealousy that existed between Victoria and New Westminster.

RECENT notice in these columns of long ore shoots has elicited considerable discussion of what is the longest known ore shoot. A Kaslo paper and the Butte *Inter-Mountain* in discussing their local "shoots" claim that while others may be longer there are none richer than those they cite, which brings up an entirely different subject. So far the Smuggler-Union mine of San Miguel Co., Colorado, with its continuous ore shoot 5280 feet long, appears to claim precedence so far as length is concerned.

CONSIDERABLE is still being said about the recent silly newspaper "boom" of the Coffee Creek district "hurting" Trinity county mines, and California in general. The kind of people who take any stock in the yards of stuff printed during that brief "boom" cannot help nor hurt any section much. Trinity Co. is unaffected by such meretricious happenings, and miners and investors understand the situation. There is plenty of gold there—to be got by plenty of hard work and the putting out of plenty money—just the same as everywhere else.

RECENTLY were published the names of 213 new subscribers to this paper in twenty-one days. That is, the names of 213 men subscribing for this paper for one year were received in this office during twenty-one days. Incidentally it may be said that during the month of September, '97, there were received from California and Colorado the names of 179 new subscribers. This strikingly illustrates the growth of the circulation, the evident merit of the journal, and the evident value of its advertising columns to those who want business.

A MEETING of the joint committee from the State Miners' Association and the Anti-Debris Association was to have been held in San Francisco last Saturday to agree upon action before Congress on river improvement, but had to be indefinitely postponed, as there was no basis upon which to work. The joint committee from the Anti-Debris Association and the Miners' Association has delegated to its chairman, Wm. Johnston, power to call it together should the California Debris Commission be ready to report plans in time for action. The idea now is to have a conference after the publication of the report of the United States engineers, who have been long preparing a comprehensive and permanent plan for the improvement of these rivers. It is expected that this report will be ready soon.

A NEW method of shot firing in mines has been evolved by a working miner, consisting of a hollow brass or copper needle, to be inserted in the cartridge containing the charge. The shot is rammed in the usual way, but the detonator is not inserted in the charge until the stemming is completed. By means of a thin copper rod, tipped with hard paper, the detonator is passed up the hollow needle and placed in the position required in the charge and secured by a spring. Should a detonator prove defective and the shot fail to explode, it is stated that the faulty detonator can be withdrawn and another substituted. By the employment of this device it is claimed that the element of danger is almost entirely removed, for no second hole where a faulty charge occurs is required, while the hole is rammed before the dangerous detonator is inserted.

New Publications.

"*A Treatise on the American Law Relating to Mines and Mineral Lands Within the Public States and Territories, and Governing the Acquisition and Enjoyment of Mining Rights in Lands of the Public Domain. By Curtis H. Lindley of the San Francisco bar; in two volumes.*"

Notice was made of the above entitled work some months ago. It is now about to be issued, and from advance sheets it is evident that it will be a permanent and valuable addition to the mining literature of this country. It enters into the subject more fully than any similar work that has fallen under the writer's observation; and while its author modestly disclaims any pretension to originality, yet were it merely a compilation it would deserve favorable notice by reason of its admirable arrangement, everything following in natural sequence, the question suggested in the mind of the reader being explicitly answered and the authority cited. The following is an extract from the preface, which indicates the scope and value of the work:

"The United States cannot be said to possess a National Mining Code, in the sense that the term is used and understood among the older nations of the earth.

"The system of rules which sanctions and regulates the acquisition and enjoyment of mining rights, and defines the conditions under which title may be obtained to mineral lands within the public domain of the United States, is composed of several elements, most of which find expression in positive legislative enactment. Others, while depending for their existence and application upon the sanction of the General Government, either express or implied, are in a measure controlled by local environment, and are evidenced by the expressed will of local assemblages embodied in written regulations, or rest in unwritten customs peculiar to the vicinage.

"American mining law may therefore be said to be found expressed—

"(1) *In the legislation of Congress;* (2) *In the legislation of the various States and Territories supplementing Congressional action, and in harmony therewith;* (3) *In local rules and customs or regulations established in different localities not repugnant to Federal legislation, or that of the State or Territory wherein they are operative.*

"This system, as thus constituted, is deemed national only in a restricted sense. As a rule of property, it has no application or force in many of the States of the Union.

"Generally speaking, its operation is limited geographically to the area acquired by the General Government by cession from the original States, or by treaty with or purchase from foreign powers subsequent to theorganization of the General Government, or perhaps, more logically stated, its operation is co-extensive with the area of the public domain, the primary ownership and right of disposal of which resides in the General Government.

"It does not seek to regulate or control mines or mining within lands held in private ownership, except such only as are acquired directly from the Government under the mining laws, and then only forming a muniment of the locator's or purchaser's title, and measuring his rights.

"It does not require the payment of either tribute or royalty as a condition upon which the public mineral lands may be explored or worked.

"It treats the Government simply as a private proprietor holding the paramount title to its public domain, with right of disposal, upon such terms and conditions, and subject to such limitations, as the law-making power may prescribe.

"The National Government acquired no rights to property within the present boundaries of the thirteen original States; nor in the States of Vermont, Kentucky, Maine or West Virginia, which were severally carved out of territory originally forming a part of some one of the original States; nor in Texas, as by the terms of its admission in the Union the State retained all the vacant and unappropriated public lands lying within its limits, for the purpose of liquidating its debt contracted while it was an independent republic.

"The entire area of Tennessee was originally public domain, but the United States donated the same to the State, after deducting the lands necessary to fill the obligations in the deed of cession of North Carolina.

"In Arkansas, Illinois, Missouri, Iowa, Michigan, Minnesota and Wisconsin lands of the Government containing the baser metals (lead and copper) were ordered sold under special laws prior to the discovery of gold in California.

"By acts of Congress, passed at different times, Alabama, Michigan, Wisconsin, Minnesota, Missouri and Kansas were excepted from the operation of the general mining laws.

"The system is inoperative in Oklahoma, as by Congressional law all lands within that Territory are declared to be agricultural.

"With the exception, perhaps, of lands containing deposits of coal, and some of the baser metallic substances, the system is practically confined in its operation to those States and Territories lying wholly or in part west of the 100th meridian, embracing the States of California, Colorado, Oregon, Washington, Nevada, Idaho, Montana, North Dakota, South Dakota, Wyoming and Utah, the Territories of Arizona and New Mexico, and the District of Alaska. These comprise the precious metal-bearing States and Territories of the 'Public Domain.'

"As thus defined and limited, 'American Mining Law' is the subject of this treatise.

"While in the treatment of the subject, and in the discussion of the origin and growth of the system, as we understand it, we shall at times encounter the earmarks of an older civilization, and find lodged in what we might term a primitive custom, the experience of ages; yet wherever its rules depart from the doctrine of the common law the system, as such, is of recent birth and modern development. It is an evolution from primitive and peculiar conditions, a crystallization of usages which do not appeal to antiquity for either their force or wisdom.

"It is the principal design of this work to treat of this system as it is at present constituted. But as it is in itself an evolution out of antecedent and somewhat complex conditions, some space will be devoted to a consideration of an historical nature concerning the policy of the Government in dealing with its mineral lands prior to the enactment of general laws affecting them, and to trace the growth of the system through its various stages of development.

"As an appropriate introduction to a treatise of this nature, the author has inserted a chapter epitomizing the different systems of mining jurisprudence in force at different periods in the countries from which the United States acquired its public domain. We may reasonably expect to find in the growth and development of our own system the influence of those laws. It has also been deemed advisable to insert a brief review of the systems adopted in the States of the Union wherein the Federal Government acquired no property, and where the regulation of the mining industry falls exclusively within the jurisdiction of State legislation.

"This comparative review of the mining laws, foreign and State, will at least be of historical interest, if it should serve no other or higher purpose.

"As State and Territorial legislation supplementing the acts of Congress is permitted, if not in fact contemplated, by the Federal laws, careful consideration will be given to these local statutes and the decisions of the courts in construing them. The value of a decision as a precedent often depends on local customs. The legitimate scope of this permissive local legislation is a fruitful subject of controversy.

"The existing legislation of each State and Territory supplementing the Federal laws, and together with references to legislation on cognate subjects, will be found in the appendix, with citations under each section indicating where the subject matter has been discussed and generally treated in the text.

"The appendix also contains the various acts of Congress upon the subject of mineral lands, and the regulations of the land department, with back references to the text; also such forms as in the author's judgment might be serviceable to the profession.

"In citing authorities the author has adopted the rule of citing the case from the original report only. But in the table of cases appearing at the end of the second volume will be found the date of the decision, and a citation to every standard report, including the 'National Reporter' system, wherein the case appears.

"Realizing the importance of a comprehensive and exhaustive index, the author has himself undertaken the work of its preparation. While the treatise is in the main devoted to a consideration of the Federal mining system, to meet the general expectation of the profession, we deem it advisable to devote some space to cognate subjects, including rights and liabilities arising out of the conduct of mining ventures, mining partnerships, co-tenancy, and obligations flowing from contractural relations.

"The necessity for a comprehensive treatise on American mining laws is conceded. The literature on this branch of jurisprudence is limited. Most of the works which have been presented to the profession, while possessing great merit, have not attempted a systematic or philosophical treatment of the subject.

"The preparation of a work which will fulfill the requirements of the profession and prove measurably satisfactory, is a matter of great moment, involving much time and patient labor.

"While not anticipating that the result of his efforts will fully meet the wants of the profession, the author expresses a hope that it will be found of value to those who are interested in the study of the many intricate questions arising out of the mining laws."

* * *

With the author the performance is equal to the promise, and it is to be reasonably assumed, from its character, that the work will be cited as authority on the subjects discussed. It is being issued by the Bancroft-Whitney Co. of San Francisco, and will be shortly on sale.

"*Seventeenth Annual Report of the United States Geological Survey.*" Eight Volumes. During the week was also received the Seventeenth Annual Report of the United States Geological Survey—Charles Walcott, director—in its entirety. Apart from the statistical portion, there is a vast collection of original information in connection with the subject, throughout the entire country, admirably arranged and more than ordinarily well produced typographically, being even more than up to the customary standard of these publications.

The work of the United States Geological Survey is of such enormous magnitude, and covers so great a scope of country, that any attempt to publish a result of the work completed or in progress must necessarily be greatly condensed. Recognizing the great importance of the mining industry of the country, such condensation has been less manifest in that portion of the work than in any other branch, and the present work does full justice to that important factor of public prosperity. California, particularly, has reason to feel complimented in the space given to its mining industries and their intelligent discussion.

In previous issues of this paper have been given at great length extracts from advance sheets of monographs on the various gold districts of this State. Following is an extract from Part II—"Economic Geology"—being a portion of an article by Waldemar Lindgren on the "Gold Quartz Veins of Nevada City and Grass Valley Districts, California:"

Structure of the Veins.—The character of the fissure determines, to a great extent, the structure of the vein. The simplest form of a fissure is a joint plane, such as is seen in regions of intense sheeting about the Lecompton and Canada Hill mines or in the seam belt of the Red Hill west of the Nevada City mine. On some of these joints there is a narrow line of quartz, accompanied by a slight bleaching of the rock on each side. Certain of these breaks along the joint planes may be more pronounced and extensive, or one larger break may be produced instead of a series of smaller ones. In such case there is usually a more noticeable movement along the fault plane, and the sliding of two irregular surfaces on each other produced more or less continuous open spaces, which were subsequently filled with quartz. This is the character of the Idaho-Maryland, the Mountaineer and the Omaha veins, for instance. The vein here consists simply of a filling of white quartz 2 or 3 feet wide between two parallel surfaces. The regularity is usually not maintained over a large extent of the vein. It is extremely common to find local pinches, and sometimes the vein is found to close down to a mere seam in whole levels, above and below which good ore is found. Again, in places the vein loses its regular character by reason of local fracturing and brecciating of the hanging wall. To this first relatively simple type many veins in the district belong.

Another class of veins, to which the Empire, the North Star and many others belong, presents a somewhat more complicated structure. In them the simple clean break is replaced by a compound one, in which two or more distinct fractures have been formed at a distance of a few feet; between these lies more or less crushed and brecciated rock. Quartz-filled fissures lie along the hanging wall or along the foot wall, or along any minor break in the rock between the walls. The latter may more or less distinctly assume the character of a breccia cemented by quartz. It is usual, however, to find the main quartz vein close to the hanging wall. The rock between the walls is always most altered by metasomatic processes. The little veins and seams, sometimes, forming a network in it, are predominantly composed of calcite. The hanging wall is generally more distinct than the foot wall.

In the examples mentioned thus far the evidence of extensive movement along the vein is less pronounced, the brecciated structures indicating a sudden short break rather than a long-continued grinding of the walls against each other. Schistose structure, due to the latter condition, occurs in places—for instance, along both walls in the Idaho-Maryland and the North Star, but only in the Ural and Merrifield veins does it become prominent. In these the quartz, where the vein is simple, is adjoined by several feet of schistose rocks, produced by the pressure and movement along the fissure; where the vein is compound, smaller streaks and seams of quartz are distributed through this schist, which may attain a width of 20 feet or more.

The width of the quartz vein may in some cases attain several feet. On the Merrifield vein a width of 6 and 10 feet of solid quartz has been observed, and in the Ural vein, in the Nevada City mine, one smaller ore body reached 12 feet. Ordinarily 2 to 3 feet is the width of the Merrifield and Ural veins. The other veins in the Nevada City district will not average 2 feet in width. With a few exceptions, the veins in the Banner Hill district are narrow, averaging hardly more than 18 inches. The Grass Valley veins are narrow, excepting the Idaho-Maryland, Gold Point and a few more, and scarcely average 18 inches in width. Many veins, such as Houston Hill and Norambagua, have paid well with an average width of 6 inches, or even less. Seams with only an inch or two of quartz will sometimes contain an extraordinary amount of gold.

In the comparatively soft black slates of the Mariposa formation, along the mother lode, a vein structure frequently appears, which, though not occurring in the region described, may be mentioned for comparison. The vein lies along the contact of black slate and diabase, separated by a distinct, and often polished, hanging wall of the latter. There is rarely a continuous and well-defined vein, but the black slate is crushed, sometimes over a width of 20 feet, or even more, and stringers of quartz penetrate it in all directions. Again, the pay is contained in the quartz, but it is, of course, necessary to mine the whole width of the stringer zone, which thus furnishes large masses of low-grade ore.

General Features.—The rich quartz may occur in entirely irregular patches and areas on the plane of the vein. It is much more common, however, to find it occurring in more or less regular bodies, usually referred to as "ore shoots." Extremely rich masses of small extent and irregular form are called "pockets," or when they have a regular, long-drawn form, "chimneys." Pockets with local accumulation of coarse free gold often occur in the pay shoots of the Grass Valley mines; the Peabody and also the Gold Hill mines in Grass Valley, the Sneath and Clay and the Mohawk near Nevada City are examples of such pocket veins. The quartz between the pockets may be almost barren or it may contain a fair-grade ore.

In most of the veins the development of quartz is not confined to the ore shoots. In other words, the vein preserves its general character over a large area, but only in part of it—the ore shoot—does the quartz contain enough gold to be extracted as an ore. In another and smaller class of veins, represented by the Nevada City, the Omaha, the Pittsburg and others, all quartz occurring in the vein is good ore, and outside of the ore shoots the vein closes down to a seam. The question what grade of quartz is regarded as ore of course influences the extent of the shoots. In the district here considered everything above $6 per ton, the average cost of deep mining and milling, is included as ore, although in most mines this tenor is considerably exceeded.

Form of the Shoots.—In general the shoot has an elongated shape, and forms an angle with the horizontal plane, which generally differs, though usually not greatly, from the dip of the vein. In other words, the shoot usually pitches at a steep angle on the plane of the vein. The following law appears to govern the general direction: *The shoot will, as a rule, pitch to the left of an observer standing on the apex of the vein and looking down in the direction of the dip.*

In a number of veins there is, to be sure, no great regularity, or the ore shoot will often be found to dip at the same angle as the vein, but the number of instances in which the above rule is applicable renders it indubitable that this occurrence of the ore is the result of certain conditions as yet not fully understood. This law holds good in a great many mining districts of the gold belt outside of these here described, and it is certainly worthy of close scrutiny. Pay shoots dipping in opposite direction from that above stated are said to occur on the Gold Flat vein, the Slate Ledge vein, and the Little Diamond vein.

No relation could be established between the direction of the pay shoots and the direction of the striation on the walls. According to the so-called Clayton's law, they should coincide.

Pay shoots may cross from one formation into another without change. As examples may be cited the Providence mine, Merrifield vein, in the Nevada City district; Union vein, Banner Hill district; Empire vein and Granite Hill vein, Grass Valley district. The apex of most of the large pay shoots discovered very naturally crops on the surface, but this is not an invariable rule. The apex of the Eureka-Idaho shoot, for instance, was found at a depth of about 100 feet; the beginning of the main ore shoot of the W. Y. O. D. was not found till a depth of several hundred feet was reached; neither did the rich shoot of the Ural vein in the Providence appear on the surface. The possibility of finding a new ore shoot at any depth must be conceded.

While the largest ore shoots may be from several hundred up to 2000 feet wide and up to 3000 feet long, there are many shoots on the smaller veins which have a much less width and length. These smaller shoots sometimes go down to great depth, but are in general less to be depended on for permanence in depth than wider ore bodies. Even the small chimneys and pockets in the seam belt of Red Hill are stated to follow the law stated above.

The North Star workings form an excellent example of a large ore shoot following the same law. In this case the main shoot is composed of a number of smaller ore bodies with similar trend, separated by spaces in which the vein has closed down to a seam. The Eureka-Idaho ore shoot is unique in its long extent and flat dip; this is also probably the most uniform shoot in the district, containing relatively few barren places or pinches and having a known length of over 3000 feet. No relation of the ore shoots to the cross fissures could be found. Indeed, the latter are generally later than the ore fissures and do not carry quartz. Intersection of two veins—a phenomenon not very often observed—will sometimes, but not always, produce richer ore bodies.

Permanence in Depth.—This question is one of the highest importance, bringing up the whole future of the industry of gold mining.

It is certain that the experience with many of the smaller bodies of ore is that they give out or pinch at varying depth. Others, again, have continued to the greatest depth at which the exploitation of the mines has been carried on. Similar relations prevail in regard to the large ore shoots. While some have been found to cease in depth—the Sierra Buttes mine, in Sierra county, being a well-authenticated example—others continue to the deepest levels as strong as or stronger than in the upper part of the mine, the Kennedy mine, in Amador county, being an example of the latter class.

The frequent local irregularities of most shoots make it very difficult to affirm, without extensive explorations, that the end of any certain ore body has been reached. Owing to the habit of immediately distributing profits as dividends, reserve funds for exploratory work are seldom available, and a local impoverishment in a level has often been sufficient to close a good mine. Experience with the large shoots is still insufficient for safe generalization.

The ore shoot of the North Star extends for a distance of about 2500 feet in depth, measured along the plane of the vein. When approaching the sedimentary area to the west, it was cut off or divided into stringers. Still, the explorations are scarcely extensive enough to affirm that its end has

been reached; its continuation may be found, or a parallel shoot may be found in depth. In the case of the large Empire shoot a complication has arisen, due to a split of the main vein, reducing the tenor of the ore by dividing it on three veins. The Eureka-Idaho shoot has held its own remarkably well and uniformly over a distance of over 5000 feet, though the richest part of it was probably found in the Eureka and the western part of the Idaho ground.

High-grade ore is now mined in the Maryland mine on the same shoot at a vertical depth of 1500 feet, and a small ore shoot was found near the bottom of the Idaho shaft at a depth of 2200 feet. As gold quartz veins of fair grade occur near the summit of Banner hill, at an elevation of 3800 feet above the sea, or 3500 feet above the bottom of the Idaho shaft, we have in this district within short distance a vertical interval of 3500 feet within which there is no evidence of any gradual change in the character or quality of the ore. Again, in the vicinity of Washington, Nevada county, excellent quartz is mined 600 feet below the river level, in the Eagle Bird mine, and on the ridges north of the river 2000 feet above the river level. In this distance there are no distinct differences in the quality of the ore.

Many smaller veins carry only one ore shoot, but in the larger fissures there are generally several of them. There is a strong probability that in such veins thorough exploration laterally or in depth will develop new bodies of ore if the one on which exploitation has been carried on is found to pinch out. The question will naturally arise as to whether, with increased depth and cost of mining, it will be a good venture to carry on the necessary dead work. This will have to be decided by the record of the mine and the character of the fissure.

It is generally conceded now that fissures are, comparatively speaking, surface phenomena, and that below a certain depth, where plasticity and flow of rocks under pressure come into play, open spaces cannot exist. This limit Professor Heim, for instance, places at 16,000 feet, while professor Van Hise, basing his consideration on the strength of rocks, arrives at 33,000 feet as the maximum limit for hard rocks in which fissures can exist. Even the lowest of these estimates far exceeds the depth of practical mining. But it is not likely that all fissures continue until that limit. On a small scale the discontinuance of fissures may be observed in extensive sheeted outcrops. It is also an incontestable fact that many small veins close up in depth, while others continue unchanged. In considering the probable permanency of a given vein, its general character must be taken into consideration. Continuous well-defined outcrops and wide bodies of quartz are in general good indications of the maintenance in depth, as is also any evidence of strong faulting and movement. Some quite extensive veins, though, have relatively short outcrops. Thus, the Eureka-Idaho practically shows croppings only for a distance of 2000 feet, but within that distance they are very prominent. Those of the North Star are less than 2000 feet long. From the developments to the east along the Omaha system it is pretty certain that the vein does not continue far across in that direction. A fissure which can be definitely proved to extend only a short distance will in all probability be found to be correspondingly limited in depth. In regard to probable permanency of the vein in depth, the Ural and Merrifield, along which extensive faulting has taken place, stand first in the districts.

In scrutinizing the scant statistics of the production, in tons and value, of the Grass Valley district, it can not be denied that they show on the whole a distinct decrease. There is also a distinct decrease in the average value of the ore. It is not safe, however, to draw too far-reaching conclusions from these data, because there are many factors involved: The cost of treatment and mining has decreased greatly by reason of the modern methods introduced, and more low-grade ores are now milled than formerly; nor are there any rich surface ores left to swell the grade.

Leaving the difficult question of deep mining out of consideration, there are, however, in both districts a large number of veins which have been only slightly developed, but with improved methods may be converted into paying mines. The development of these will probably maintain the production of the district for many years in the future, even if no new ore bodies are discovered in the old mines.

It can be confidently stated that there is no gradual diminution of the tenor of the ore in the pay shoots below the zone of surface decomposition. Within the same shoot there may be many and great variations of the tenor, but there is certainly no gradual decrease of it from the surface down. This important fact has been previously stated by those conversant with the veins, such as Professor Silliman and Mr. J. A. Phillips. The statements to the contrary, for instance, by Mr. Laur or Mr. Reyer are due to imperfect acquaintance with the facts and generalization from insufficient premises.

Crosscutting.—As a means of finding new and parallel veins, crosscutting is frequently advisable, especially in those parts where strong sheeting of the rocks prevails. In the larger part of these districts, however, a series of parallel, distinct veins appear instead of the sheeting. These veins are nearly always traceable on the ground, and in such cases crosscutting has rarely developed veins not known already on the surface.

Gold in Dutch Guiana.

The Dutch Guiana gold mining ledges are mainly placer quartz, only approachable by wealthy corporations and men fully understanding the details of the enterprise they are about to undertake. The country is one dense forest. Beyond a radius of 100 miles from the sea obstructions become frequent in all the rivers, and portage has then to be resorted to. There is a total absence of any knowledge of what gold mining really means and a lack of capital in the country. All the gold found up to date has been placer. It penetrates large surfaces in minute particles. In the creek beds it is found in small nuggets in pockets. In the interior the rolling country is called the "hill system," and is described as being composed of gneiss and mica schists, crossed by basaltic dykes, containing auriferous deposits of drift conglomerate, old river beds and the shallow course of existing waterways. The drift conglomerate is of ferruginous nature, of a red color. The gold bush is the unhealthiest part of the colony. Fumes arise from stagnant water, poisonous plants are everywhere, and lucky, indeed, is the American gold seeker who escapes alive from the green tombs of the Dutch colony.

It Rained Pebbles.

Sometimes we have what is known as an east or desert wind. It is not pleasant and the air becomes so charged with dust and heat that one can scarcely breathe. They are supposed to emanate from the Colorado desert, and from a traveler recently crossing those barren wastes our sand storms almost vanish by comparison with one which he describes. They had come down from Yuma in a boat, he and two Indians who worked the oars, and had just made a landing on the Hardy Colorado river, when the sky became overclouded in almost as little time as is occupied in the telling—there were flashes of lightning and peals of thunder, and then it began to rain pebbles. As the fury of the storm increased these pebbles had almost the size of bullets and attained a terrific velocity. The Indians sought protection behind trunks of trees on the river bank, while the traveler got behind some boxes in the boat and covered his head with a blanket. The storm continued for two hours and not a drop of water fell. The Indians afterward stated that it was of unusual violence, the most severe that had occurred in four years, though sand storms are frequent on the desert. —Ensenada Lower Californian.

Georgia's Bauxite Mines.

The traveler through Georgia might well inquire what animal frequents the country that burrows in white clay. For, as bauxite is usually found in such soil, every man who has a spot of it on his farm digs for ore. It is the peculiarity of bauxite to occur in pockets of more or less frequency in one vicinity, the value of the land being determined by the size and number of the deposits. Bauxite is not found at a greater depth than 150 feet, and, because of this, intricate machinery is not necessary. Until the last few years the work was done entirely by hand. The expense of manufacturing aluminum from the ores keeps down the demand, as it is still utilized chiefly in the making of alum—a much less valuable product. The aluminum is made by the electrolysis process, which is controlled in the United States by the Pittsburg Reduction Company, which owns the mineral right of the Barnsley mines in Bartow county, Georgia. Many efforts have been made to manufacture aluminum by some other method than electrolysis, but so far they have failed, and the Pittsburg people still monopolize the aluminum product. The mining outfit consists of a washer that separates the ore from the clay, a dryer, elevator, and the engine and boiler with necessary pumps. The washer is a large box of heavy planks 30 feet long, and rests upon a frame of heavy wood; inside this there revolves two heavy logs, upon which are the agitators in the form of conveyors. One end of this box is elevated about 6 inches. The ore is dumped in at the lower end, and the water is forced through a perforated trough the entire length. The ore is passed up by the washer by the water and agitators, and at the upper end the clay and water pour into a trough just above the level, at which time the ore passes out in its natural globular form. When this machine is working correctly the ore is as clean as when washed by hand. From here the ore goes to the dryer. It has the capacity of retaining a large per cent of water, and it has been a problem to dry it successfully in a short time. Until recently the principal mine dried by exposing the ore to the sun, which delayed returns from the work for a long time. The dryer now in use is a large cylinder, from 30 to 60 inches in diameter, graded by the capacity of the mine. At one end is a large firebox, or furnace, with smoke box and stack at the other. This cylinder makes from four to eight revolutions per minute, propelled by the engine. It is elevated at one end, where the ore is poured in; it is taken up by the conveyors, passed around and around in the flame from the fire box, which pervades the whole cylinder, and when it is received by the elevator from a box on one side the fire box it is perfectly dried. It is taken from the elevator to the storeroom, and, after being classified by an expert, is ready for the market.

$33 for One Apple.

TO THE EDITOR:—The story came to me second hand, so I give it as it came. The man who related it is an old man now, residing in our town. I have not a speaking acquaintance with but see him quite often when down town.

Years ago he was running a three-card monte game (whatever that means, I don't know) in a southern California town. One day a big apple of the Gloria Mundi variety made its appearance among the crowd around his table. The man who had it paid $5 for it. The apple was "put up at $1.50 on the corner," and the owner kept winning it back. The game ran for three days and three nights, the "corners" reduced meantime to $1, when luck went against the owner and the "three-card monte man" won it. He was out just $33 to get it. He said he deliberately cleared up the table, climbed up on top of it and ate that apple, skin, seeds, core and stem, while men stood around and offered $5 for just one bite. MRS. MAY TAYLOR.

Hale, Mo.

This beats current Klondike quotations.

The Cyanide Process.

Beginning with the issue of November 7th, 1896, appeared herein a paper by H. Van F. Furman, entitled "Laboratory Tests in Connection with the Extraction of Gold from Ores by the Cyanide Process." With the issue of December 19th, 1896, began a paper on the "Solution and Precipitation of the Cyanide of Gold," by S. B. Christy of the California State University. These two papers—more especially the latter one, the last portion of which appeared in the issue of February 6th, 1897,—have attracted a great deal of deserved attention, Professor Christy's paper having been the subject of vigorous criticism in all parts of the mining world. At the Chicago meeting of the American Institue of Mining Engineers there was some discussion of Professor Christy's paper, which, taken in connection with the article itself, is of considerable interest to cyanide workers everywhere. E. B. Wilson, himself an author of a work on the cyanide process, says:

Professor Christy's paper is, beyond doubt, the most valuable contribution hitherto made by an impartial investigator to the literature of the cyanide process; and the Institute is to be congratulated upon its possession of a member willing to labor so greatly, and to communicate the results of his labors so freely, for the benefit of his professional colleagues.

In offering some criticisms upon Professor Christy's interpretations and conclusions, I do not question the accuracy of his work, or the facts which it establishes, but only the application of these facts to the theory (and incidentally to the practical operation) of the process.

I start with the proposition, which I think has been proved by experiment, that in the solution of gold by means of alkaline cyanides the various reactions are determined, as to their order and intensity, by the relative position of the elements concerned in the electro-chemical series, or series of voltaic tension. While this theory, originally propounded by Berzelius as a law governing all chemical reactions, has been questioned (and, perhaps, in its universal and unqualified application, disproved) on the evidence of contradictory observations, I think the results reported by Gore and others show it to be a safe guide under the conditions here in question.

From the voltaic-tension series, as given by Gore, I quote the following elements, as those especially involved in this inquiry, prefixing to each the number indicating its position in the series, in the order from electro-positive to electro-negative:

3. Potassium.	20. Lead	37. Carbon.
4. Sodium.	24. Copper.	39. Nitrogen.
8. Calcium.	25. Hydrogen.	40. Arsenic.
9. Magnesium.	27. Silver.	43. Sulphur.
12. Manganese.	28. Antimony.	45. Bromine.
13. Zinc.	29. Tellurium.	46. Chlorine.
15. Iron.	31. Gold.	47. Oxygen.

According to the well-known principles of the electro-chemical theory, the wider apart any two elements in this series, the greater the electro-motive force of the current they would produce as a voltaic couple; the greater their affinity, or tendency to unite; the greater the amount of heat they liberate in uniting; and conversely, the greater the amount of heat (or equivalent electrical energy) required to decompose the compound formed by their union.

Oxygen, being the most electro-negative element in the voltaic series, is the one which liberates most heat by its union with other elements, and consequently the one most effective in decomposing their compounds.

It follows also from the theory, that in solution involving oxidation, those elements are most readily dissolved which are farthest from oxygen in the electro-chemical series, and evolve by their oxidation the most heat. And it may be asserted, as a corollary proposition, that in cases, both of chemical union and of chemical decomposition, those changes first occur to which there is the least resistance, as the resultant of the relative affinities of the elements present, as measured by their distance apart in the electro-chemical series. In voltaic cells, each metal of the series is corroded, and evolves heat; but the highest electro-motive force is obtained by coupling two elements widest apart in the series; that is, other things being equal, the most easily corroded metal, coupled with the one least easily corroded, yields the most intense current. Potassium and gold would thus form a stronger voltaic couple than could be formed by either of them with zinc, iron, lead or copper, or by either of them with any other. This may account, in some measure, for the stability of the auro-potassic cyanide.

But, in my opinion, the action of oxygen is necessary to develop the molecular energy required to effect the reactions resulting, under the conditions of this process, in the union of potassium and gold. Professor Christy aptly compares the part of oxygen in this case with that which it plays in the circulation of the blood of men and animals. At all events, his thorough investigations confirm the results of my own experiment and practice, in showing that the presence of oxygen, or an equivalent agent, is

necessary to the solution of gold by this process. Whether either chlorine or bromine does, in fact, perform directly the work of oxygen in the case under consideration, will be considered below. For the present, I assume that oxygen is required.

Since the development of oxygen by the decomposition of the water present would require the expenditure of more energy than the furnishing of it from the atmosphere or by other artificial means, the process would proceed more slowly in the former case.

The Pelatan-Clerici method obtains oxygen in two ways, namely, by the decomposing action of the electric current upon water, and by the exposure of the charge, through agitation to the oxygen of the air. This permits the employment of a much weaker cyanide solution.

Mr. Kendall furnishes oxygen by the use of sodium dioxide. His method, like that of Pelatan-Clerici, requires careful preliminary determination of the amount of oxygen required.

The representatives of the MacArthur-Forrest patented process, while claiming, as Prof. Christy has pointed out, that the action of oxygen was not necessary, ignorantly included it, nevertheless, in the practical operations of percolation and drainage which they prescribed. For not only would the material which they propose to treat be, in their process, at all times exposed to the atmosphere, which contains free oxygen, but the water with which they dilute their solvent solution always carries, in addition to the oxygen which is one of its constituents, a considerable amount of oxygen in solution (by aeration). To these circumstances may undoubtedly be attributed the effective operation of their process when neither agitation nor extraneous artificial means of supplying oxygen are employed.

Since the double salt, $KAuCy_2$, is very stable, and acid does not readily destroy it, I am inclined to believe that acid and the salts of base metals do not cause in this process the extensive loss of cyanogen which has been attributed to them, but rather that this loss is due to other impurities present in the solution at the moment of the formation of the double cyanide of K and Au. I am aware that this view may be controverted on the ground that KCy is readily decomposed by dilute acids. But it may be replied that this is not the case in the presence of gold—a phenomenon which I ascribe to voltaic action. In this connection also the fact may be mentioned that if the amount of lime necessary for the mineralization of the ore be determined, it seems to make no difference in the result whether this lime be added before the lixiviation or at the time of the latter; the amount of cyanogen consumed being about the same in either case. This proposition, I am aware, contradicts the statement of Mr. Furman, in his paper on "Laboratory Tests," etc. (page 4), to the effect that if an ore be acid "the result will be decomposed of potassium cyanide unless this acidity is destroyed before the cyanide solution is added." In support of my view I would refer to the experiments described below.

These experiments show also that a 0.1 per cent cyanide solution may dissolve the gold as thoroughly as a 1 per cent solution. If the latter were used in a given case, we might expect the loss of cyanide to be ten times as great, depending, however, on the amount of impurities in the ore having affinity for the cyanogen set free.

Strong cyanide solutions have shown, when applied to acid ores, considerable loss of cyanide, but at the same time a high extraction of gold—higher in a given period than when the ore had been previously neutralized. However, when impurities in the solution are a minimum or entirely absent, it will be found that the stronger the solution, the greater the loss of cyanide.

Accepting Prof. Christy's conclusion (as opposed to the view of Mr. MacArthur) that free oxygen is necessary to the usual reaction effecting the solution of gold in cyanide solutions, I must venture to doubt his opinion that bromine is capable of doing the same work as oxygen in this reaction. I agree with him that strong solutions of bromine and potassium cyanide should be avoided, as occasioning a loss of cyanogen; but I believe that the formation of paracyanogen, to which he refers, requires the liberation, in some way, of oxygen.

The order, in the voltaic series already given, of the elements K (3), C (37), N (39) and Br (45) would indicate that bromine has stronger affinity for potassium than either carbon or nitrogen taken separately; but we have here to deal with the compound negative radical cyanogen (CN), which closely resembles bromine in many respects, and is more volatile, assuming the liquid state under the pressure of three atmospheres, while bromine is liquid at ordinary temperature and pressure. We are justified in the inference that if the compounds of cyanogen require oxygen for the reaction here under consideration, bromine, which stands so near cyanogen, will not effect the reaction without oxygen.

The question is: Does KCy require the presence of oxygen for the formation of the double cyanide with gold?

Mr. W. Bettle has reported experiments in which gold was dissolved from tailings containing basic ferric sulphate in the absence of even traces of free oxygen, the active agent being cyanogen. The formula which he proposes for the reaction is:

$$4KCy+K_6Fe_2Cy_{12}+2Au=2KAuCy_2+2K_4FeCy_6.$$

It will be noticed that, according to this explanation, the ferricyanide is reduced to a ferrocyanide, which calls for an oxidizing agent.

Mr. Bettle says in another communication:

"While potassic ferric cyanide is capable of decomposing water in the presence of an oxidizable material, I maintain that gold in ordinary solutions is not an oxidizable material, and, therefore, for the dissolution of gold cyanogen must be placed in atomic contact with this element in a cyanide solution. * * * To argue otherwise is to assume that aurous or auric oxide is formed by the oxygen liberated, and one of these oxides dissolves cyanide to form the auro, or auric cyanide, of the metal."

Prof. J. C. S. Wells of Columbia University has declared that zinc-potassic cyanide is a solvent for gold, but not when free potassium cyanide is present; and he adds that since in the practice of the cyanide process the solutions do always contain free potassic cyanide, the solvent power of the double zinc-salt is not available.

Prof. Christy and Mr. Bettle require the presence of free cyanogen to effect the reaction in the absence of oxygen, while I think, with Prof. Wells, that the reaction will not take place without oxygen.

Mr. Clannel, in a paper on the Sulman process, has described certain experiments which throw light upon this subject. He placed in three separate breakers the following solutions: (1) A dilute solution of KCy; (2) a dilute solution of BrCy, and (3) a mixture of the two solutions, and covered each with a watch-glass, on which was suspended a drop of nitrate of silver. The drop over No. 1 gradually became turbid from the formation of cyanide of silver; the drop over No 2 remained unchanged; the drop over No. 3 rapidly became white, showing that hydrocyanic acid was rapidly liberated from the solution below. This requires hydrogen, and the only source of hydrogen under the circumstances is the decomposition of water, which must liberate, either as free oxygen or as peroxide of hydrogen, the oxygen necessary to the reaction. Mr. Clannel proposes the following equation, based on the fact that HCy is a product of the decomposition:

$$5KCy + 2BrCy + 2Au + H_2O = 2KAuCy_2 + 2KBr + KCyO + 2HCy.$$

If his explanation be correct, the active agent is not cyanogen bromide, but potassium cyanate, which quickens the reaction when bromo-cyanide solutions are employed.

Before seeing Mr. Clannel's article on the Sulman cyanogen-bromide process, I had formulated the following reactions, which I considered as occurring, not simultaneously, but in close succession:

I. $3KCy+Au+BrCy+O+H_2O=KAuCy_2+BrCy,Cy+2KOH.$

II. $2KOH+BrCy,Cy+Au=KAuCy_2+KBr+O+H_2O.$

The first of these equations represents the supposition that Cy has more affinity than Br for K. It is evident, however, that any potassic hydrate formed will not long remain unaffected in such a solution, and hence the reaction expressed in the second equation quickly follows, supplying the oxygen necessary for the solution of the gold as an element in the double cyanide. The above equations leave free oxygen as a result, and, if the theory here advanced be tenable, we may expect more cyanogen to be liberated the more oxygen is present. With this result the consumption of cyanide in the process stands connected, and if base metal salts or other impurities are present in abundance the loss will be greater from that cause. It is my impression that too much stress has been laid upon metallic and not enough upon earthy salts in this connection, and I hope to be able to give, at some future time, experimental proof that, by paying due regard to the latter, an increased extraction of gold, coupled with a saving of cyanide, can be realized in practice.

The experiments of my own, to which reference has been made above, were made upon several portions of the same ore-sample at the same time, and occupied the same period of treatment—namely, fifteen hours. The results were as follows:

	No. of Experiment.		
	1.	*2.*	*3.*
Percentage of KCy in solution before use	1 0809	0.5404	0.1081
Percentage of KCy in solution after use	0.5145	0.0837	0.0042
Consumption of KCy by difference	0 5664	0.4567	0.1009
Extraction in milligrammes, gold	0.5	2.3	2.2
" " " silver	72.45	138.4	103.3
Percentage of extraction of total gold and silver	73.0	86.7	79.0

It is evident that the proper strength of the solution for this particular ore would be between that of experiment No. 2 and that of No. 3, since in the latter case nearly all the cyanide was consumed, and the amount was shown to be too small for a maximum extraction. It will be noticed that the consumption of cyanide did not influence the percentage of extraction in this case.

The Electrical Precipitation of Gold from Auro-Potassic Cyanide.—Of the three conditions, none of which Prof. Christy says (p. 23) can be secured in precipitating gold electrically from a cyanide ore-extraction solution, two are not essential to the process. The conditions necessary for successful electro-chemical action are: (1) a liquid; (2) a definite chemical compound in the liquid; and (3) that the liquid compound be a conductor of electricity.

These conditions do not necessitate either Prof. Christy's No. 1, a soluble anode of the metal to be deposited, or his No. 2, concentrated solutions of the double cyanide of gold and potassium. As to his No. 3, an electrolyte of constant composition, whereby the proper working conditions may be constantly maintained, it is not, as he thinks, impracticable. The electrolyte is a solution of potassium cyanide. It may be changed chemically by the passage of the current, but in any case the potassium and cyanide remain in some form in the solution. It is true that the electrolyte may offer a high specific resistance; but it is more than likely that impurities in the liquor assist in a measure the passage of the current, or they may be introduced artificially to assist it, as, for instance, in the Pelatan Clerici process, in which about 1 per cent of common salt (NaCl) is placed in the bath, for no other purpose than to give the electrolyte a sufficient and practically constant conductivity during the whole operation. If other impurities in the liquor assist the passage of the current, so much the better; if they retard it, their effect is not noticeable.

With such a feeble current as is generated in the zinc-boxes the strength of the cyanide solutions is of considerable moment, but when electricity is applied to weak cyanide solutions, the strength of the solution is of very little moment. Prof. Christy's comparison of electroplating or gilding with the electrical precipitation of gold in this case is not well taken. In the first instance, we want an even deposit in a given time; in the second, we want the gold irrespective of uniformity of deposit.

Professor Christy says with reason that the two processes are different; but all the differences and difficulties which he points out, such as absence of a gold anode, weakness of the solution, formation of aurocyanhydric acid, or imperfect division of the double cyanide into its constituents, may be, as he acknowledges, avoided by the use of currents with sufficient intensity and quantity of electricity. He remarks (on the last line of page 23) that nobody would think of extracting, from such weak solutions, any other metal than gold by electricity. His reason for this opinion is apparently the high cost of the current required. At least, if the difficulty of maintaining a practically constant electrolyte be overcome, the question of cost seems to be the only one which can justify his conclusion. Let us see what is the weight of this consideration.

To decompose the gold salts and cause this metal to be deposited, a theoretical voltage of about 0.4 volts is required, without a gold anode. Let us assume that in practice it is 1.5 volts, a figure which should satisfy the most conservative. A current of 1.5 volts and of 500 amperes represents 1-horse power, which costs, say, 40 cents per twenty-four hours; this estimate being likewise liberal.

Such a current, in a solution of gold employed for gilding, where the whole of the amperage is used to precipitate the gold, would precipitate more than $1000 in gold per hour, and more than $24,000 in twenty-four hours. The cost of the electric energy consumed would therefore not reach $\frac{1}{600}$ of the value of the gold. If, in order to exhaust the weak solutions and overcome the difficulties pointed out by Professor Christy, the electric energy and quantity should be increased a hundred-fold, the expense would be $\frac{1}{600}$ of the value of the gold; or if it should be increased 1000 times, it would be but $\frac{1}{60}$ of the value of the gold, which would still not be a prohibitory condition. In fact, when we calculate upon the generation of electricity by hydraulic power we can almost reduce the running cost to that of oil and waste.

The action at the anode in saving the double salt $AuKCy_2$ would be first upon Au, then upon K, as gold is less positive than potassium; and the order of deposition would be the same. The cyanide in part reunites with K forming KCy; the remainder of the Cy being lost, as far as practice goes. It may form paracyanogen or ferrocyanide, but even then the loss is less than occurs in the zinc-boxes, because of the weaker solutions used. The Pelatan-Clerici process takes advantage of the cyanide liberated at the anode in this way: if free gold is near, the free cyanogen unites with it; or if KCy and Au are in juxtaposition they are also united by the oxygen at that point, and in both instances being electrolyzed, are made ready for deposition. Thus by this process the solving and deposition goes on in the same vessel in an almost constant electrolyte, until the gold is exhausted.

With the Siemens-Halske process artificial diffusion is necessary to precipitation; but in the above process it is already provided as requisite to the solution; nor is it necessary to enlarge the size of the plates in the latter process beyond a definite proportion necessary for the size of each vat. Hence no inconvenience or extra expense is encountered (p. 24), such as would, in Professor Christy's language, "rob the method of its simplicity, cheapness and convenience."

(To be Continued.)

Mining Law Amendment.

To the Editor:—I enclose a communication on the important subject of the revision of the present absurd and inconsistent mining laws in force in the United States. I never fully realized how bad they were until I attempted to explain them to the venerable Professor Cumenge of the Ecole des Mines, Paris, on the occasion of his visit to Cripple Creek. While I was a delegate to the Denver Gold Convention, I was called away before I had an opportunity to bring the matter up and present my views. Hoping that something will come out of this agitation, and glad to assist in any way, I am,

Yours sincerely,

Francis T. Freeland.

Aspen, Colorado, Sept. 24, '97.

If the intention be to propose a bill which would be of some real benefit to the mining industry, let the entire system be altered to one following somewhat the last Mexican law. Thus, in brief:

First—Location without discovery.

Second—Official survey in plots of ten acres or less, in one piece of any shape without conflicts.

Third—Federal tax until patent of $50 per claim per year in lieu of assessment work, the recorded receipt of the land office to carry title, and a failure to pay working forfeiture.

Fourth—Vertical boundaries and no lateral rights.

1.—*Discovery*: Most mining claims, especially in Leadville, Aspen, and Cripple Creek, have no mineral in place of any commercial value for mining purposes in the discovery shafts. Yet when one buys the oldest location in such a case, the title is liable to fall when brought to a trial. The laws and decisions in the various States and Territories are not in accord as to whether a discovery in the discovery shaft is required.

2.—*Survey*: An official survey would make precise the position of the claim, and insure compliance with all the requirements of location.

3.—*Assessment Work*: It is extremely rare for the assessment work to be of any real benefit in the development of a claim; it is usually wasted labor. The tax would prevent the holding of large blocks of claims by one person.

4.—*Lateral Rights*: With the present laws and decisions it is impossible to determine the ownership and rights of a piece of mining property under the Federal and State laws.

The best statement of what may become the law, that can be given is:

"A.—The extralateral right must be bounded by parallel lines.

"B.—The extralateral boundary must be an extension of some line or lines of the claim as located, or preferably as patented—or parallel thereto.

"Let a line of the claim crossed by an apex be called an actual end line in distinction to the nominal endline named in the location patent. Neglecting the condition altogether too rare yet assumed by the law, where the apex crosses the two nominal end lines, then:

"C.—Where the nominal side lines are the actual end lines, the extralateral right will proceed in the direction of these side lines provided that the true dip is more nearly in that course than in the course of the nominal end lines, and vice versa.

"D.—Where the apex crosses a side and an end line, the extralateral right will be bounded by lines drawn through the points of intersection of the apex with the side and end line, and in the direction of the end line when the true dip is more nearly in that course than in the course of the side line, and vice versa; and similarly for a claim located before May 10, 1872, with end lines which are not parallel but crossed by an apex."

But if vigorously pushed the number of trials, appeals and rehearings are nearly interminable. Most suits end by an agreement defining their rights without reference to the supposed law, or by buying out of the weaker party. After twenty-two years of litigation it is not known positively what are the lateral rights of a claim where the apex crosses a side and an end line, or where it bows out across one side line! The curious doctrine of cross lodes enunciated by the Colorado courts does not obtain elsewhere and has not been passed upon by the courts of final resort. Yet it must be worked under at present, when it is almost certain to be reversed. The effect of dykes, faults and a lode or contact without ore, upon the continuity of the vein has not been authoritatively fixed. The relations of lode claims to placers and tunnel sites are in the greatest confusion. Town sites, agricultural, railroad and school lands and grants give much trouble to the miners.

The patenting could proceed about as now on payment of $500 per claim additional. On this plan the tedious and perplexing procedures in the land office, hearings, adverses and protests would be much abbreviated and the delay and expense lessened.

While no such law could be made retroactive, the tendency of the courts and juries, after it had been passed, would probably be to give much importance to the earlier location, even when not showing a strong pay vein, and to make it difficult, if not impossible to win an apex case.

Such a law would stop 90 per cent of the litigation affecting the industry of the West, with its enormous cost and paralyzing delay, resulting in bitter hatreds and unneighborly conduct in regard to drainage, ventilation and exchange of valuable information. With diminishing prices for the products of mining and increasing difficulties on account of depth, low grade and refractory ore, scarcity of timber and available water, etc., every unnecessary expense must be cut off if the industry shall continue, and the towns and farms dependent upon it regain some measure of their former prosperity. And litigation is the most unnecessary expense of all. Title ought not to be dependent upon the longest purse, tentative decisions of the courts, the testimony of expert witness advocates, the vagaries of socialistic juries, or the crude impressions of their hasty trip to the locality when unskilled in the art of mining.

The present law is tainted with geology, giving rise to great difference of opinions in the course of a trial, and has been the cause of bringing the profession of mining engineering into disrepute among the general public. With a law as suggested, a joint survey would settle the boundary, and a reference to the records the ownership, in most cases, without a suit. With a secure title one could sell at a fair price, and when buying, he would know what he had bought; again, the miner, if so inclined, would have but little difficulty in raising money for development and equipment, where the technical conditions justified the venture. The absence of apex rights would tend to distribute valuable territory among many different owners.

The miners have hitherto been opposed to such a law, but it is believed that a great change has taken place in their sentiments. They can hardly expect attorneys to agitate for it, and legislators must be pressed. The expert witness is probably indifferent to the matter. If such revision of the laws were made, the increased amount of mining would afford them ample opportunity for the exercise of all their learning and ingenuity. The East has no interest in it generally, except from investments in mines and mining stocks. If the miners wish it, it can be done. The details of a law so different from the one in force, and untried here, should be thoroughly discussed.

Francis T. Freeland.

Mr. Freeland is manager Isabella G. M., Co. Zenobia G. M. Co., Work M. & M. Co., Ingham Cons. G. M. Co., Crippie Creek; Durant M. Co., Late Acquisition Cons. M. Co., Compromise M. Co., Mineral Farm Cons. M. Co., Aspen Contact M. Co., Bimetallic M. & M. Co., Aspen, Colo. He is one of Colorado's representative miners, and takes the same general stand that do others, viz.: that proposed amendments should be in the interest of the working miner and mine owner.

One of Their Questionable Methods.

To the Editor:—In your last issue to hand you comment in "Concentrates" on the International Ore and Reduction Company. Amongst its references that company uses the Eureka and Excelsior mines, and we receive weekly inquiries as to the size of the furnace in use, its cost and its success, the circular of the International Ore and Reduction Company stating that the results of our work here and our uniform success in treatment of rebellious ores is due to use of one of their furnaces. As old subscribers to your journal, we ask you to kindly state that the International Ore and Reduction Company have no right to refer to us; that no furnace has been in operation at any time upon ores of the Eureka and Excelsior mines, as the ores—containing, crude, over 90 per cent of silica—are not adapted for smelting, and that we are no way interested in any of that company's endeavors to dupe mining men. Yours very truly,

J. Henry Longmaid,
Manager Eureka and Excelsior Mines.

Bourne, Baker Co., Or., Sept. 23, '97.

During last week at Woolwich arsenal, England, employes have been engaged in destroying 400 torpedoes, together with their fittings, which were recently condemned as a result of the reports made to the lords of admiralty. These reports set forth that the movements of the torpedoes after firing were extremely erratic, and that on several occasion they had come seriously near blowing up the ship from which they had been discharged. The missiles were made under the Whitehead patent. Their approximate cost was $2,500 each and hence their condemnation means the virtual throwing overboard of a round million of dollars. A Birmingham firm of ammunition manufacturers made an offer to purchase the entire lot at face value, with a view to making a re-sale to a foreign nation, but the lords of admiralty decided that such sale would involve the revealing to the naval department of such nation of the secret mechanism by which the balance chambers of these torpedoes are arranged, and the offer was refused.

A new diving bell at work in Lake Michigan is claimed to be able to withstand the pressure of water at a depth of 1156 feet. It has discovered the wreck of the steamer Pewabic, sunk in 160 feet of water thirty-two years ago.

British Comment on American Mines.

To the Editor:—While in your issue of the 14th ult. you editorially answer partially—though not, as you indicate, effectually—the question, "Why should a man want to sell mining property?" you leave, I think, much to be said on the subject of the buying and the selling of mines that, I feel sure, might be advanced with advantage to your journal, as well as profit to many of your readers, providing they could be prevailed upon to view mining property as farming, shipping or industrial property of any description is usually regarded by the man of business who invariably invests himself or influences others to do so on at least the speculation of deriving benefit therefrom.

It is now nearly a quarter of a century since I first visited California, and many years have passed since my last visit, but having numerous friends there, besides business interests, I have to some extent maintained a certain connection with the State that from time to time brings mining and other ventures under my notice. And it is to a few of the former that I would now like to draw your attention and, if permissible, to encroach upon your valuable space. As it would be eminently unfair, if not improper, to give undue publicity to affairs that after all chiefly concern the individual, I will, without mentioning either names or localities, allude to some instances of what appears to me to be unwisdom on the part of mine owners. A. is a company that has millionaires many times on the list of its stockholders. It owns what is considered to be by competent experts very valuable placer ground, on which, in consequence of miscalculations or erroneous judgment (contingencies closely connected with and almost inseparable from all mining ventures) on the part of the management, a large amount of money was expended without producing the expected or any profit, and the outlay of which was only useful in so far as it went to establish the necessity of an additional expenditure in order to arrive at the hoped-for results. Was this "additional expenditure" incurred? No; work was discontinued and the property offered for sale at a fixed *cash* figure. And, as no one has thought this figure tempting enough to warrant the essential expenditure, the mine—reported, mind you, to be a good one, and many of its stockholders capitalists—remains unworked. And why? Because the owners insist upon a tidy sum in *cash*, and will not exchange say one-half or any proportion of their share holdings for the expenditure of the sum regarded as requisite to make the property a very profitable one in place of being, as it has been for years and now is, nonproductive and dead and not even good for the taxes. The question in this case is as to whether the owners, in their own interest or in the interest of the mining industry, are pursuing a prudent plan.

B. is a company with few stockholders, possessed of a good-going gold mine producing say $100,000 a year net profit, and in order to double this amount an expenditure of probably $200,000 was estimated, so that rather than risk this the owners, or some of them, thought the best course for them to follow would be to offer the mine for sale, which they did at, by way of illustration, say $1,000,000 in cash. Responsible parties to whom this proposal was presented, and who were from independent sources not unaware of the merits of the mine as well as its history (which was the reverse of regular as to profit), replied by intimating that on the basis of $500,000 cash and $250,000 in shares the business would be taken up in earnest, which intimation was, I am advised, received by the owners as almost an insult to their intelligence. In this instance were the owners judicious or otherwise? If they had accepted the $500,000 cash they would have been assured at once to that extent and become participators with their new co-owners in whatever profit or loss they might have, while in the course they have chosen they require to risk $200,000 to increase the profit or output, for which they will have to wait until it—as well as the $500,000, which would have been paid in cash—is taken out of the mine—which will be years—in order to be in as good a position as they might have been, with their risks largely reduced and a stated sum secured to them for investment elsewhere, or, as the saying is, "to put their eggs in more than one basket."

C. A. P.

London, Sept. 16, '97.

The total length of the world's telegraph system has now reached 4,908,921 miles, exclusive of 180,440 miles of submarine cables. Of this Europe has 1,764,790 miles, Asia, 310,685 miles; Africa, 99,409 miles; Australia, 217,479 miles; and America 2,516,548 miles. United States Consul Germain, who sends these figures to the State Department from Zurich, says they show that, notwithstanding the steady increase in the building of telegraph lines all over Europe, America leads the world, and has almost doubled the European mileage.

The Southern Pacific Company has completed an examination of its trainmen, dispatchers, station agents and section men west of El Paso and Ogden for color blindness. There were about 5200. Out of this number, the sight of 193 was found to be defective as to colors.

Electrical Progress.

Electric Metering from the Station Standpoint.*

By CARYL D. HASKINS.

It has occurred to me that in presenting a paper to the Institute upon such a subject as that which I have selected I may appear to have departed too entirely from the technical side of our profession, and to have selected a line of argument which would have been more appropriate before a commercial body. But, in my opinion, such is not the case, for I find that almost every merit in or objection to metering apparatus, or in connection with the use of it, is dependent upon some point involving engineering skill.

The general adoption of the electric meter is in itself an indorsement of the precise methods which characterize engineering practice. It is, indeed, a well-established fact to-day, well borne out by data from widely separated portions of the country, that the average electric lighting station can do one-third more business with the same station capacity on a meter basis than it could upon a contract basis, under what were nominally equivalent contract rates, netting at the same time the same revenue per light as formerly. In other words, it is apparently well established that 33⅓ per cent represents the average wastefulness of average human nature in connection with the use of light.

In many central stations to-day I find that, while managers are almost universal in favor of an exclusively meter basis, a large proportion are still in ignorance as to what qualities they should seek and what they should avoid in selecting a meter.

In response to an inquiry as to what merits in a meter are necessary to success, a common reply is accuracy, durability, registration in a simple unit easily comprehended by the customer and ability to withstand tampering. These points are probably of importance in about the sequence in which they are commonly stated, but they are too sweeping, too entirely generic and too slightly specific to be in any high degree helpful.

Let us, for example, consider the broad question of accuracy. A meter which will be accurate under commercial conditions from quarter load to full load within one-tenth of one per cent, or a meter which will start on one per cent of its rated capacity, are neither of them necessarily either the most accurate or the best for general commercial use. This latter point is one which is frequently raised. The fact that a meter will start on one per cent of its rated capacity is in reality no sure criterion of the accuracy of that meter, even on light loads. It is not necessarily even good evidence, yet I find that in very many cases this is almost the only test applied to meters at the time of purchase. The percentage of accuracy at light loads is very important—more important, I believe, than is commonly appreciated; but I am perfectly safe in saying that a meter which will run within five per cent of zero, or on five per cent of its rated capacity, may readily be a much better meter, even though it will not run at all on one per cent of its rated capacity, than one which will run on one per cent of its rated capacity, but in regard to which no evidence is at hand as to its percentage of accuracy at reasonably low loads.

Ability to start on very light loads is certainly an indication of merit and is important, but it is not nearly as important a point to determine as is the lowest load at which a meter begins to register with fair accuracy. I have inspected a very large number of meters which would start on phenomenally low loads, and which would yet fail to give anything like approximate accuracy at reasonably low loads.

In considering the question of accuracy, therefore, the first two steps should be to determine the accuracy of the meter by actual measurements at full and medium load, and also at a reasonably low load—say, for example, five per cent of the meter's rating.

That low load accuracy is really of vital importance is well shown by the fact that, with the average 24-hour station, in the neighborhood of 15 per cent of the total station output goes to feed one and two lamp loads. Yet in the face of this I have seen large installations of meters reported as entirely satisfactory, tested with frequency and care under admirable systems, but only at full or medium loads, and yet failing to account for more than 50 per cent of the one and two lamp load—or, in other words, losing to the illuminating company an average of probably 7½ per cent of the revenue which their measured station output should give them, after deducting for legitimate losses.

Granting that, having determined the actual percentage of accuracy obtainable at light, medium and full loads, a very important, and, in fact, probably the most important, evidence as to accuracy has been obtained, there still remains much information of vital importance which should be sought and which should materially influence a decision.

One point which is very commonly neglected, but which is, nevertheless, quite essential, is the ability of a meter to give accurate results for brief periods on overloads. This is a point at which many meters fail, and it is also a point which, odd as it may seem, is intimately related to light-load accuracy. It may be laid down, as a rule, that in station operation the smallest meter which will do the work should always be used. Otherwise, however good the meter on light loads, much of the light-load revenue must be lost in the effort to take care of occasional heavy loads. Extremely heavy loads are generally of brief duration, and on these loads a meter should operate with accuracy and also without injury to itself. This, therefore, should be an early point of investigation in selecting a meter.

On alternating circuits inductive loads are becoming commoner every day. The wider use of fan motors and other alternating power devices, the rapidly growing popularity of alternating-circuit arc lamps, and the commoner use of inductive "dimmers," all render it essential that a meter should be accurate, irrespective of the power factor. The company which insists upon charging its patrons for power delivered to fan motors on a basis of volt-amperes, is obviously rendering itself unpopular, greatly limiting its business and giving its competitor or competitors the best opportunity for intruding; yet many such companies exist to-day, and they exist, not because they are following a wise policy in their own estimation, but because they are ignorant of what they should look for in the meter which they are using.

Again, there are few electric light stations to-day of any considerable size and age which are not operating some smooth-core and some tooth-core alternating armatures. It is, therefore, important that the meters in service at such stations should be equally accurate on any shape of wave; yet many meters fail in this particular, and seldom, if ever, is the point made a subject for investigation in selecting measuring apparatus.

This same consideration holds good in connection with frequency, and this is a point which it is difficult to overcome in most metering devices; but it is one which should be earnestly sought, and which is of importance both to the station and to the consumer.

Even after this long list of points which must be investigated, as contributing to the broad question of accuracy, there are others which also merit consideration, but to a less degree. Such, for example, as barometric conditions (more especially altitude), temperature, and humidity. These all have direct bearing upon the question and all enter into the every-day conditions of central station practice.

Summing up the question of accuracy, we may say, therefore, that the following points should be investigated with care: Ordinary volt-ampere accuracy, accuracy on inductive loads, accuracy on varying wave forms, accuracy on overload, accuracy on varying frequency, influence on accuracy of variations of temperature, barometric conditions, and humidity.

The second point which is commonly given consideration in the selection of a meter is that of life. This is a question which must depend more upon good judgment than upon any test which can be applied; for it is in reality no test of the enduring qualities of a meter to run it at excessively high speed for a relatively brief time. The life of a meter, in other words, cannot be measured by revolutions, irrespective of the speed of those revolutions, nor can it be determined by the speed at which it rotates alone.

Ninety per cent of all the wear in a meter centers, in the case of motor meters, at the single jewel bearing, which is almost universal. The two chief factors which have influence upon the mere mechanical life are the weight of the moving mechanism and its speed, the variation of the area of the point of contact being, of course, always so small as to be out of the consideration.

A low-speed meter is usually the best meter, provided the speed be not carried so very low as to threaten the accuracy of the meter on light loads, by reason of being held up by intermittent friction in the form of dust or a spider. Practice has indicated that low speed is more conducive to long life than is light weight of the moving mechanism, although both are, of course, very important. More important than either, however, is the quality of the material used at the points of friction and the ease with which the friction parts can be renewed. The best of sapphire is barely good enough, and the pivot end must be of correct shape, burnished to the highest degree, and its point must be absolutely concentric with the center of movement.

More than half of the meter jewels which are destroyed are rendered useless, not by the rotary motion of the shaft, but by reciprocating motion of the shaft, due to vibration. Hence, it is very necessary that the jewels should be in some way cushioned, for vibration cannot be always avoided.

These are all, I admit, mechanical considerations, but they compass much of failure or success in electric metering. The purely electrical features of the meter contribute no grave factor of consideration in connection with the life question, always supposing that the copper is ample, and the potential windings are so distributed and so ventilated as to preclude a burn-out.

Passing over the central station man's third factor for consideration, that of the best unit of measurement, as one which is practically a closed question, we are brought face to face with his lamentable fourth point—the necessity that the meter should be able to withstand tampering. It is a regrettable fact that this is a consideration which is coming daily into more prominence; but light has to be sold to all sorts and conditions of people; and apparently the transgressor against meters is even more common than the transgressor against taxes; and this is a growing evil, largely, perhaps, because of the lax condition of the laws which can be invoked to protect the meter owner in many of our States.

(To be Continued.)

*Read at the Fourteenth General Meeting of the American Institute of Electrical Engineers, Eliot, Me., July 27, 1897.

WIRELESS telegraphy was recently carried out on board the Italian war vessel Spezia as follows, telegrams being transmitted twelve miles: Secured to the mast of the ship, 90 feet high, was a vertical copper wire, ten millimeters in section, covered with guttapercha; one end attached to the receiver on board, the other end free. Another mast of like height was erected ashore, and the transmitter attached to its vertical wire. Another mast and transmitter were also placed in the arsenal. Two ironclad war vessels were engaged for two weeks in taking observations. In these experiments it was demonstrated that the instruments could be securely placed deep down in the hull—messages being intelligible by the receiving instrument in a cabin 8 feet under water, notwithstanding its surroundings of iron.

A LARGE electric plant is proposed in the Cœur d'Alenes, Idaho, to utilize the mountain water power in generating electrical power and light for the several mines in that region. Thompson's Falls is suggested as being the most feasible point.

Mechanical Progress.

Boiler and Flywheel Compared.

The *Journal of Commerce* compares the centrifugal force which acts evenly over every square inch of a flywheel rim, to disrupt and throw it off, to the pressure on a boiler, exerted the same on all sides, tending to tear the cylinder asunder, and says that the bursting point is obtained for the former the same as for the latter.

The centrifugal force of a certain rim revolving varies as the square of the speed of revolution. If the speed is twice as much the centrifugal force will be four times as great. If the mass increases the centrifugal force is increased in proportion, and it also varies as the radius of the circle of revolution. To find the centrifugal force, multiply the weight by the square of the velocity and divide by 32.2 times the radius of gyration (one-half diameter).

We may take, as in a boiler, a rim 1 inch thick and 1 inch wide and we have a certain condition, and the addition of an inch inside or outside, or on either side to make up the whole wheel, we need not consider, but allow each inch to take care of itself. Or we might consider the wheel made up of a large number of inch-square plugs, and figure the centrifugal force of each plug and call it the pressure, as we would in a boiler on each square inch.

If we figure it as we would a boiler, we will take a 3-inch rim, and say it has a tensile strength of 12,000 pounds per inch, then $12,000 \times 3 = 36,000$ pounds. To find the bursting point of a boiler, divide the lowest tensile strength by one-half the diameter in inches. So with a 20-foot flywheel, 3 inches rim, a tensile strength of 36,000 pounds, and diameter 20 feet, 240 inches. According to the rule, the bursting point would be $36,000 \div 120$ (half the diameter)$=300$ pounds. That is, it would require 300 pounds centrifugal force on each inch of the rim to burst the flywheel. See how much there really is. An inch-square plug through the rim would weigh $3 \times .26 = .78$ pounds. According to the rule given for the centrifugal force, the square of the velocity, 62.83 feet per second at 60 revolutions per minute $= 3947.61 \times .78$ (weight per square inch) $= 3079.13 \div 322$ (32.2×10, radius of gyration)$= 9.5$ pounds on each square inch, while it requires thirty times as much to burst it. This looks safe, but when we consider that the centrifugal force varies as the square of the velocity, it does not take long for this fifty to disappear. Thus, if the speed went up to 120 revolutions, twice as much, the centrifugal force would have been increased to $4 \times 9.5 = 36$ pounds against the 300, or now only eight times as much as would burst it. Increase the speed to 240 revolutions a minute, four times as much, and the centrifugal force is sixteen times as much, or 152 pounds against 300, and so it goes. It looks very well when a wheel is running at normal speed to say, "It will take thirty times as much force as is on it now to burst it," but that soon disappears when an engine commences to race.

TO CANVAS COVER a pulley, have it ready and cement thinned; use a flat, soft brush and paint the surface of the pulley, laying it on smoothly. Let the coating on the pulley set for an hour, when the canvas may be put on. Cut the canvas about half an inch narrower than the pulley and of ample length to go around it. When ready to wind the

canvas make a scraper of wood the width of the pulley, and then cement about a foot of one end of the canvas, giving it a good heavy coating that it may adhere well in the fiber of the cloth, and lay it on the pulley, leaving an even margin on each side, then rub down with the scraper, getting the canvas down flat and hard. Proceed in this way, cementing only about a foot at a time, until the pulley has been circled; then cut off the end to form an even butt, and finish by cementing strip of thin cloth across the seam.

Inventions Ahead of Their Time.

We sometimes hear of inventions which have appeared "before their time," and it may be of interest to consider just what it means for an idea to have come into the world before conditions are ready for it. Every one who has had to do with the Patent Office knows what is meant by the "state of the art," and one of the first duties of an examiner is to investigate the status of general knowledge and practice in that branch of science to which the application belongs. In such cases, however, the intention is to discover, if such be the case, whether the invention has not been anticipated by some device or method in general use. On the other hand, it may sometimes be most important to know whether or no the "state of the art" is far enough advanced to enable the idea to be utilized or applied, as upon this very question the practical fate of a device often depends. Many ingenious and patient men have worked persistently to develop inventions for which the art was not ready, but which, in later years, when materials, methods and markets had developed, proved to be fully as valuable and important as had originally been anticipated.

The pneumatic bicycle tire would be of little value if the rubber industry were not equal to the production of the proper material from which to make it, and the motor carriage is, in like manner, dependent upon the parallel development of the storage of energy. Professor Langley has shown us how to meet the essentials of a successful flying machine, and now calmly throws the burden of the commercial success of the problem upon the builders of motors by telling them to go ahead and produce a source of power which shall be at the same time powerful enough and light enough to drive his æroplane without overweighting it. Similar conditions often confront students of applied science, and in many cases brilliant ideas have proved commercially worthless simply because of the practical impossibility of realizing the constructive conditions. There is little doubt that it would prove a most profitable occupation for thoroughly informed specialists to make a study of neglected inventions upon which the patents have expired, and which have never been developed for the above reasons, bringing to this revival of past ideas the present possibilities in the light of more recent developments in science and construction. — W. H. Smyth in Cassier's Magazine.

A Magnetic Drill.

The use of magnets for lifting purposes and as a substitute for clamps is rapidly extending, and to see the ease and facility with which a five-ton casting can be picked up and carried around the shop is very striking, says the *Engineering Magazine*. With the old process holes have to be bored in masses of metal in all sorts of odd and inconvenient places and at angles so that very often it is necessary to rig clamps for holding the drilling machine to its work. The application of the portable electric motor for this purpose was a long step in advance, and this method has been of great service in dealing with the armor of the new cruisers. When a portable drill, however, is coupled with a magnetic clamping device the ideal conditions are realized. Dr. Louis Bell recently described a drill of this pattern. It consists of a motor and its worm-driven drill, together with a universal mounting of four adjustable feet. When placed fairly upon a ship's plate or other mass of iron these drills have an adhesive force of nearly half a ton each. The drill can then be adjusted and clamped by the simple turning of a key, and it will then bore holes up to an inch in diameter as fast as it can be safely worked. The whole affair weighs only about 200 pounds. These portable drills in small sizes, particularly when the clamping is magnetic, are invaluable in general machine shop practice and in modern building work.

THE Pittsburg Reduction Company has been asked by the United States Geological Survey to make a bid for furnishing aluminum discs and pins for bench marks. The Survey uses these bench marks in its topographic work to indicate attitudes. They are placed as permanent records at conspicuous points where the Survey parties have been at work. The Survey has been using bench marks made of brass, but these have not proven altogether satisfactory, and aluminum may be substituted.

Scientific Progress.

The Eastern Arctic Sea.

Supan gives a review of Nansen's polar expedition, from which the following notes on the Eastern Arctic sea (the northern part of the eastern hemisphere) are taken. Sheets of ice occupy much of the surface, continually drifted by currents and winds; now torn apart and opening water channels, now pressed together and forming walls and ridges. The latter reach heights of nine miles, and offer the greatest obstacles to sled traveling. The remnants of former ridges drift about in berg-like masses with steep walls. The drift ice here is contrasted with the much thicker pack ice west of Greenland. The winter snow began melting in June, and the firm drift ice was not revealed till the end of summer. Its color is then a dirty brown, caused chiefly by mineral dust. Fresh water pools are formed on the ice surface, surprisingly rich in microscopic organisms. The ice increased in thickness slowly through the winter to June, varied until August, and decreased to early winter. Thickening in summer is ascribed to freezing underneath of fresh water supplied by melting snow above. In early spring the ice was coldest, from —16° to —30° C. In summer it approached the melting point, and then became plastic, so that crushing took place without sound; bending frequently replaced breaking.

The discovery of the great depth of the Arctic, 3000 to 3900 m., where traversed by the Fram, is regarded as the most important geographical result of the expedition. Polar lands are, therefore, not to be expected. A sample of serial temperature soundings gives a surface layer 200 m. deep at —1° C.; a second layer, 660 m. thick, with mean temperature of +0°.22 C., and about 3000 m. of deep water with mean temperature of —0°.57 C. The surface layer has least salt, and the intermediate layer most. The latter is supplied from the North Atlantic, dipping beneath the Arctic surface layer because its density is determined by salinity rather than by temperature.

WHEN climbing a staircase or ladder a man can exert about 2,000,000 foot-pounds in a day of eight hours. An average military ration is equivalent to about four pounds of meat, of which fully three-fourths are water and one-half of the remaining fourth only is carbon, so that half a pound of carbon, burnt in the human furnace, will do as much work as four times the quantity in the form of coal used through the medium of an engine and boiler. For the present, at least, therefore, the most economical form of stored energy which one can carry about with him is a good square meal, although its conversion into effective work may not be so pleasant an operation as that of permitting the coal to expand its own latent energy.—Scientific Machinist.

Premature Burials.

Consul Mantius writes from Turin, Italy:

"Prominent physicians and laymen are at present busily engaged in preparing an exhaustive report, with exhibits, on the subject of 'apparent death and premature burial.' This report will be the striking feature of the medical department at the national exposition to be opened here in April, 1898. Reports of similar kind are expected from all over the world. There will be an international competition and a prize will be awarded for the best work on the solution of a problem in which not only the profession, but, more or less, every mortal is interested. Up to the present time, no infallible test for distinguishing apparent from real death has been discovered, in consequence of which horrifying cases of persons buried alive occur from time to time, and are narrated in medical journals and daily papers. The committee of physicians and laymen organized to gather and sift the material realize that the first step to remedy such conditions should be to obtain modification of the laws relative to the limited space of time allowed for bodies to be kept before burial in some countries. It is clearly proved that the number of persons buried alive is much larger in such countries. Therefore, the members of this commission appeal to the heads of the Governments and to all those whose position gives them influence over the people for their support in a movement which can not fail to interest humanity. It is the intention to start a periodical, which will be devoted to the furtherance of the matter in hand. Early this year, the Italian Government, through foreign ambassadors and ministers, extended an invitation to other nations to take active part in those branches of the Turin exposition which are of an international character. The main feature of the medical department might have been easily overlooked in the bulk of other interesting material. I believe inestimable good to the cause will be done by bringing it to the notice of the people of the United States."

IN the *Annales des Mines* is given an account of some experiments made at the instance of M. H. Le Chatelier to determine the chemical composition of fire-damp. In the samples examined the incombustible parts varied from 3.1 per cent to 44.4 per cent in volume, and contained of carbonic acid 0 per cent to 4 per cent, of oxygen 0 per cent to 0.9 per cent, and of nitrogen 2.2 per cent to 39.8 per cent. Nitrogen is invariably present in quantities varying from 0.74 per cent to as much as 30 per cent. In all cases the nitrogen was found to contain argon varying in proportions from 0.74 per cent to 3.28 per cent of the total nitrogen and argon together. It was concluded, as the result of experiments, that argon in fire-damp is not derived from the coal, but is only probably present in fossil air of the Carboniferous period, either absorbed directly or carried in by water, in which argon is more soluble than nitrogen, and which would account for its being generally present in higher proportion than in the atmosphere.

THE Chabot Observatory, of Oakland, Cal., has decided to send a special expedition to India to observe the total eclipse of the sun. It will be headed by astronomer Burckhalter, whose expenses will be paid by William Pearson, of San Francisco. Dr. George C. Pardee will provide a new lens for the use of the observers. The expedition is, of course, entirely distinct from that to be sent out by the Lick Observatory, the funds for which were provided by the late Mr. Crocker.

A LATE invention is the cold stove for use in the heated months for reducing the temperature. Salt, a small quantity of ice and a patented chemical produce a most intense degree of cold. It is as dangerous to touch this stove when in operation as it would be to place the hand on a fire stove at a high degree of heat. The skin is instantly taked off and painful injuries are the result of the slightest contact. The inventor claims that during the hottest weather the temperature of a room may be run down and made pleasant by the use of this novel device.

New Publications.

The Hydraulic Gold Miner's Manual: T. S. G. Kirkpatrick. A little book of forty-six pages, containing very little of information to the California miner and not up to date as to methods of their description. The time-honored definition of what a miner's inch is and what a gallon of water weighs, etc., are given, and good advice is vouchsafed to the river miner to refrain from the demon drink. The most interesting part is an extract from a newspaper letter entitled "A Season's Gold Digging on the Yukon." Some good rules are given for distinguishing different gems. Published by Spon & Chamberlain, 12 Cortland St., New York. Price, $1.

Practical Notes on Hydraulic Mining: By Geo. H. Evans, M. E. A handsome and convenient reprint of the article which was written for this paper and appeared serially in Volume 74. It is just what a man who does not know much about hydraulic mining, but would like to learn, needs. It is adapted to California theory and practice and is the result of about thirty years' practical experience of a man who is at the head of one of the biggest enterprises of the kind in the State. The issues of the MINING AND SCIENTIFIC PRESS which contained the article are all sold, and those wishing a copy of the little book, which contains the article in its entirety as it originally appeared, can be supplied by McNutt, Kahn & Co., 306 Market St., San Francisco. Price, $1.

Personal.

R. H. BRITT succeeds Supt. Cavill at the Poorman, Idaho, mine.

B. MACDONALD has returned to Gibbonsville, Idaho, from British Columbia.

PHILIP BAKER is the new manager of the Cedar Valley G. and S. M. Co., Kingman, Arizona.

COL. W. S. KEYES has returned fron attendance at the Denver committee on revision of mining laws.

THE El Dorado Co., Cal., Miners' Association has elected Thos. Clark and A. H. Ten Broeck president and vice-president, respectively.

J. J. CRAWFORD, ex-State Mineralogist, will shortly occupy his new office in the Spreckels building as a mining and hydraulic engineer.

E. N. LINDSAY, accompanied by Hermann Stahlschmidt of Germany, left for southeastern Alaska this week to examine some quartz properties.

E. DE STUTZ has resigned the superintendency of the Continental mine, Globe, Arizona, to take charge of the French Society Gold property, Coolgardie, Australia.

Commercial Paragraphs.

H. B. MATHEWS, a machinist and millwright of Clear Creek and Boulder counties, Colo., has gone to Vernon, British Columbia, to erect a stamp mill built by the J. H. Montgomery Machinery Co. of Denver, Colo.

THE Colorado Iron Works Company of Denver, Colo., reports the shipment of a 10-stamp mill, including crushers, etc., to the Golden Star Gold Mining Co., Baker City, Oregon, and the closing of a contract for a smelting plant to be erected in Mexico.

THE Baker Iron Works of Los Angeles report the shipment to W. A. Dalton, Coborce, Mexico, of one 3-stamp 1000-pound mill, 40 H. P. boiler and 20 H. P. engine; to J. D. Thomson, Santa Ana, Sonora, Mexico, one complete 2-stamp mill, 900-pound stamps, including boiler, engine and all equipments.

THE Union Iron Works will build a steel steamer of 2000 tons, speed fifteen knots, for the Alaska Commercial Co., to run between San Francisco and St. Michaels. They are also building a new steamship for the Hawaiian inter-island trade, a double-ender steel ferry-boat for the Southern Pacific Company and a steel steamer for Goodall, Perkins & Co.'s line to Mexican ports to replace the Orizaba.

Recent California Mining Incorporations.

Metropolitan Reduction Company, San Francisco; C. H. Fish, R. Hamilton, E. J. Fraser, W. L. Palmer, H. G. Blasdel; capital stock, $20,000,000; $10,000 subscribed.

Little Butte Extension Mining Company, Los Angeles; E. L. Allen, S. M. Hay, J. W. Oakley, W. J. Clark, I. C. Wood, W. Friend; capital stock, $1,000,000; subscribed, $800,000.

Oriole M. & M. Co., Stockton; F. E. Dunlap, J. B. Freitas, J. K. Wagner, A. A. Smallfield, S. A. Kitchener; capital stock, $200,000; subscribed, $150,000.

Mining Summary.

CALIFORNIA.

Amador.

The *Dispatch* says the long-standing litigation between Dr. Bardue of San Francisco, Amador Queen Mining Company, Ira P. Rankin and A. S. Cochrane, involving title to the Amador Queen and DeWitt mines, has finally been compromised by the attorneys for the parties, Vincent Neale and Wm. J. McGee, and the compromise judgment, which ended all the cases, was entered by Judge Rust on Wednesday. By the terms of the compromise Dr. Bardue becomes sole owner of the DeWitt mines, Amador Queen No. 2, the 20-stamp mill and the mill site west of Hunt's Gulch. Ira P. Rankin's estate dismissed its appeal in the Supreme Court, cancels its $13,000 mortgage on the above property, and takes a new mortgage for $1250, payable in five years, without interest. Vincent Neale becomes the owner of Amador Queen No. 1 and the balance of Amador Queen mill site, and takes the $1120 redemption money which has been in ex-Sheriff Adams' hands for the past six years. Mr. McGee says that Dr. Bardue's properties will be operated on an extensive scale as soon as men, materials and machinery can be obtained.

Record: At the Wildman-Mahoney mines eighty stamps will be put in operation in a short time. Nearly 150 men are employed.

At the American mine on Sutter creek the last run of less than two weeks with five stamps yielded $2000 in bullion. Superintendent Dennis employs twenty men.

The old Lincoln mine, which made such a brilliant record as a bullion producer when it was worked a number of years ago, remains idle. An unfortunate condition of affairs surrounds this property, as it is owned partly in Scotland and partly in this country, and there seems no immediate hope of an amicable understanding between the two factions.

The Eureka Consolidated mine is bonded by Hetty Green of New York. Some day when she turns her attention to mining, disposes of it to some one else, or passes away, it may be made to yield.

Republican: At the Anita the drift has reached 600 feet from the shaft. It is expected that another 100 feet will have to be run to reach the ore chimney which shows on the surface. It is the intention to resume sinking as soon as the north drift has reached the ore body. They will go down another 500 feet, making 1000 in all. New machinery will be put in, as the present engine is not capable of going down the depth intended.

The Butte Basin Tunnel Company, operating the big tunnel to tap the auriferous gravel supposed to lie under Butte basin, has suspended work. W. E. Stewart is working on the claim, sinking through the marl to the gravel. Some of the gravel prospects 25 cents to the pan, but nothing has been encountered so far to justify the large tunnel undertaking. The company expended about $18,000 in running this tunnel.

The Zeek mine and mill at Butte City are again in operation.

At the Alma mine they are still running the diamond drill in an easterly direction, with little or no change in the formation. The water is troublesome, which is surprising at this season of the year.

Ledger: The South Spring Hill, J. R. Tregloan, superintendent, will continue to 1400 feet in depth before going to the ledge.

The Keystone is now cleaning up every two months.

At the Live Oak mine, Stony creek, Young & Sullivan are sinking in a good ledge of ore.

Butte.

In the Carter mine there are nearly thirty men employed on the flume, tunnel and mill.

In the Peter Woods mine A. J. Walsh is superintendent, nine men are employed. The tunnel is now in 1600 feet and is still being driven ahead.

In the Pershbacker or Magalia mine Supt. Gassaway is building a 10-stamp mill to crush the cement.

Of the "Consolidated Gold Mines of California, Limited," near Oroville, E. Harvey, one of the directors, has returned to England with some notes, from which it appears that in the Banner mine at the end of August, there were 146,400 tons of payable ore in sight ready for mining and milling. Average value, $4.33 per ton. With a 40-stamp mill there would be a profit of £35 per day, or £10,500 per annum, reckoning 300 days to the year. The report says: "Corroboration of this value has been shown by actual milling tests, the particulars of the last mill run to hand giving a return from 650 tons of $4.30 per ton, without taking the yield of the concentrates into account. The value of the ore has been ascertained by a series of assays taken throughout the mine. In no instance has any sample been picked, as the whole of the face of each drift and level was cut down and included in the assays. In cases where the ore ran high in value (it has reached as much as $1,727.70 per ton) the assays were discarded in arriving at the average value, on which the above calculations of profit are based, and it will, therefore, be seen that only the low-grade ore has been taken into account. This method of valuation was decided upon so that the estimated profits should be well within the mark and absolutely reliable. All rich ore—and there are ample proofs that much exists in the quantities already opened up—will necessarily greatly increase the profits. Each additional foot driven on the 1000-foot level of the Banner mine alone will open up at least 700 feet of backs, or, say, 1400 tons of extra ore, and as driving on this level can be continued at the rate of 42 feet per week there would be about 58,800 tons of ore added weekly to the large quantity now in sight ready for mining and milling. This immense mass of payable ore will add many years to the life of the mine, and by continuing in depth below the 1000-foot level the mine will certainly, as far as any present shareholder is concerned, be inexhaustible. Assays of ore encountered in sinking the Clark & Coffee mines shaft gave a yield of $13.73 per ton. Note.—At present all exertions on these mines (the Clark and Coffee) are being confined to the sinking of the shaft, and, as the bodies of ore have not as yet been opened up, your directors have made no allowance for any yield from these mines in the estimate above given. At the same time your directors feel assured that in these, and also in the Long's Bar mine, which is also owned by the company, there is a bright future for the shareholders. The general equipment of the mines is excellent, and the machinery and plant are in first-rate order. But what is now urgently needed, and what is strongly recommended by the company's consulting engineer, is an addition of at least 30 stamps to the present milling capacity, as the existing 10-stamp mill, running full time, is utterly inadequate to cope with the enormous quantities of payable ore referred to above. Your directors are, therefore, contemplating the erection of thirty additional stamps as soon as possible. As the development work proceeds in the mines, a still further addition will have to be made to the milling power, and the more stamps the company has running the greater will be the profit, and the more economically will the operations be carried on. Your directors feel it due to Mr. Evans, the company's general manager, that they should record their appreciation of his able and untiring efforts in the interests of the shareholders. During his appointment he has made many alterations in all departments, and has effected such improvements that the company benefits considerably by the saving of expenses and the more expeditious and methodical working of the mines. In conclusion, your directors consider the present prospects of the company excellent, and in their opinion, the shareholders will not have many months to wait before knowing that the company is on a dividend-earning basis."

Calaveras.

Chronicle: In the Lamphear mine ore encountered at the 300-foot level averages 10 feet and prospects at the rate of $10 per ton the entire width. The company intends to go ahead with the sinking of the main shaft, run the necessary crosscuts and thoroughly develop the mine. W. T. Harris superintendent.

At the El Encino, Supt. Regan has tapped one of the old working shafts of the old mine, but as the old works were badly caved about the shaft the connection did not drain them. He is now cleaning out the old shaft and will push for the old works from that point.

Prospect: At the Thorpe mine, at Fourth Crossing, it will be remembered some time ago the large cog-wheel to the Cornish pump broke, then the pump got away from its mooring at the 600-foot level and went to the bottom—at the 700-foot level—in consequence of which the shaft nearly filled up with water. After long and persistent work in hoisting and pumping the large quantity of water was rapidly being mastered, and the bottom of the shaft was almost in sight. In fact another day's work without mishap would have seen all the water out, but the cable broke and the large bucket along with 150 feet of cable went to the bottom, and again the water rose to the 500-foot level. A new bucket and cable were secured and work once more resumed.

The Big Bonanza mine, near Angels, formerly known as the Harris mine was purchased by Stockton men several months ago and considerable work has been done on it. The shaft is down 140 feet, the crosscuts show a ledge with a rich pay chute.

El Dorado.

Nugget: A. A. McDonald of Grizzly Flat has struck some rich gravel in his claim and will increase the working force to upward of twenty men next week.

Fresno.

L. B. Beard writes from Pine Ridge: "One miner, one carman and my partner furnish rock to keep our four stamps at work day and night, knocking out ore worth $10 per ton in free gold. The ledge averages from 1 to 2½ feet of pay rock. We have about 3000 tons in sight. The last assay showed $42 a ton in gold, besides eighteen ounces in silver."

Kern.

Randsburg *Miner*: The clean-up of a twenty-ton run of Val Verde ore showed a value of $25 per ton. The ore came from the No. 2 shaft, out of the 3-foot ledge.

Los Angeles.

Parsons and Neiswender have located a placer mining claim in the Los Angeles river, in the Los Angeles city limits, and claim that they will go to work with machinery, pumping, etc.

Mariposa.

Gazette: R. Harper has charge of the Karan mines recently purchased by a San Francisco company. Ten men are employed.

Mono.

The Standard Consolidated Mining Company's recent dividend of 10 cents per share makes the total dividends declared to date, $3,757,868. The earnings since the declaration of the last dividend have amounted to, gross, $120,000, and net, $60,000, as it takes only $18,000 to pay a dividend, the company's surplus is rapidly increasing. There are 179,394 shares issued, 21,606 being in the company's treasury.

Nevada.

(Special Correspondence).—J. Coan and others are developing a new prospect on the Chapman ranch, two miles west of town. The shaft is down about 80 feet on a 2-foot ledge of fair grade ore.

Current rumor has it that Mrs. E. C. Huntington of New York is about to reopen the old Banner mine, three and one-half miles east of town. The property has been closed for years.

Development work on the Mountaineer is progressing successfully. This property was a rich producer for ten years, after which a barren zone was struck, and the property lay idle for a long time and filled with water. Encouraged by the success of others in deep mining, the company resumed work. Their shaft is now 1800 feet below the croppings. They are drifting north and south on the lowest level, expecting to reach the two pay chutes within 200 and 600 feet, respectively. They find good ore in their present work. W. A. Denis is superintendent.

Ohmert & Co. have leased the Gold Tunnel property from A. D. Allan. After running the tunnel 500 feet they tapped the ledge, which averages 18 inches in size and $15 in value. The property is within the city limits.

The Old Home Consolidated, comprising seven claims, five and one-half miles east of town, on which are five pay chutes, has a shaft 250 feet deep and a tunnel on the course of the ledge 1150 feet. Work was begun on this property three years ago by a San Francisco company. The ore averages $25 per ton.

La Suerte Company have begun grading a site for a 10-stamp mill.

A. D. Allan is operating his California Tunnel mine, adjoining town, on the tribute system. The shaft is 350 feet deep, connecting with the tunnel, which is 3000 feet long. This is the tunnel that drains the Reward property. There are 300 tons of $20 ore on the dump.

The Old Montana, idle for many years, resumed work recently and the outlook is promising. The property is bonded to Dr. Tickel, who has gone East to "place" it with his friends.

Nevada City, Sept. 27, '97.

(Special Correspondence).—The Red Dog Mining Company, near You Bet, have reached 200 feet on an incline. This is gravel property. From the bottom of the incline the tunnel has reached 380 feet in bedrock. The indications are that the work is close under the channel. They expect to tap the channel this week by an upraise. There is fine gold throughout all the gravel.

Times are prosperous in You Bet, so much so that a hotel of large proportions (the only one in the village) is being constructed.

The North Star Company are sinking a new shaft about 400 yards from the Stockbridge, commonly known as the Massachusetts Hill. The work is down 140 feet. It is expected that they will strike the ledge at 600 feet.

New work is progressing favorably on the Old Norambagua mine, four miles southwest of Grass Valley. The property is owned by Wm. Campbell. This property has produced a great deal of gold—in fact, it was a rich mine, but was never worked below 500 feet. Mr. Campbell proposes to pump and retimber the shaft and go to greater depth. There is a tunnel 1100 feet, striking the ledge at 500 feet. The ore runs as high as $60 per ton and the pay chute was the longest in the district, excepting that of the old Idaho. The formation is granodiorite.

Grass Valley, Sept. 25, '97.

The Liberty Hill mine, near Bear river, will soon resume operations.

The *Transcript* says there is an unusual scarcity this fall of free water for mining purposes, and the South Yuba and Excelsior companies have a demand from regular patrons for all they can supply. The operations of a number of the smaller mines in the county are as a result considerably hampered. A big storm just now would be hailed with delight in the mining regions.

Transcript: There are eight tributers working at the Pittsburg mine, but they are not getting rich very fast. There were nearly four times as many there a few months ago, but they have been quitting gradually and looking for something better. One of them says he put in a good part of the summer there and averaged only about 80 cents a day. The men there now are putting in their time on the fifth, sixth and seventh levels. Tributers occasionally strike it rich in some mines and make a good thing for a little while, but it has been generally observed that when their luck turned that way the owners of the mine would find some excuse to put them on day's pay so as to get for themselves the benefit of the improvement in the mine. As a rule, when a good miner goes to tributing, he does it for the same reason that a ship puts into any port in a storm, or as the hungry man consoles himself with the reflection that half a loaf is better than no loaf at all.

At the La Suerte quartz claim the shaft is down 225 feet. Men are grading for a 10-stamp mill to be run by water power.

The success attained at the Gaston Ridge, near Graniteville, has given a new impetus to mining in that section. This property only a few years ago was abandoned at a depth of 219 feet. It had a pay chute over 1000 feet long and produced nearly $600,000. The present company began a prospect tunnel two years ago and at about 1900 feet they have a strong ore body at a depth of 650 feet. They have 1800 tons of ore on the dump. The company is now moving the mill and boarding-house down into the canyon, and adding a rock-breaker and concentrators to their machinery. Mr. Harmon expects to have the plant in operation by the 15th of October.

There is a probability that work will soon be resumed upon the Nevada City mine, which was for years one of the most prominent producers of this district. Robert Mein is daily expecting telegraphic instructions to to take charge of the property in the interest of the London Exploration Company and another combination of capitalists who have been jointly negotiating for it.

Placer.

At Dutch Flat J. E. Doolittle is repairing flumes, putting the old Gold Run ditch in order and equipping the mine for active operations.

W. Rablin has ten men doing prospect work on the Bartley drift mine, between Dutch Flat and Alta. The main tunnel is 1020 feet. The channel is estimated to be at least 1000 feet wide. The gravel is free and works easily, there being no trace of cement.

The Young America gravel mine, below Forest City, has been bonded to a San Francisco company who will open up the channel.

Philip Nicholls of Colfax will reopen the Polar Star mine, near Dutch Flat. No doubt this will give many men employment.

The Morning Star mine at Iowa Hill has just paid its 82d dividend, the latest of $7 per share, and is now opened up so that there is said to be four years work ahead on pay gravel.

Plumas.

F. S. Quigley, from seven tons of quartz near Greenville, realized $17.50 per ton.

M. Lambert, Supt. Little Hope mine, near Merrimac, will put in five more stamps, using the heaviest make, and increase the capacity of the plant.

The *National Bulletin* says: A few men are employed at Bean Hill for the Quincy Mining & Water Company, putting that mine in readiness for work in February. Six hundred feet of flume have been built and 900 feet of pipe laid. The restraining dam at Green Flat has been improved under direction of the Debris Commission by the erection of bulkheads below and raising the dam.

Riverside.

At the Leon mine, seven miles from Winchester, owned by the Leon Gold Mining Company, the main shaft is down 220 feet and about 1500 feet of development work has been done. It is intended to erect a 10-stamp mill, 1200-pound stamps. There is a good mill site with plenty of water. The mine is patented.

San Diego.

According to the *Union*, a San Francisco prospector named Louderville has made a strike near Warner Ranch in that county. The half-column account of the find closes as follows: "An assay of a lot of the ore showed a value of $152.13 a ton. Louderville has four claims on the ledge. He has just returned from San Francisco with an expert, who will report on the property in the interest of San Francisco capitalists. The discovery is 20 feet outside the boundary line of Warner Ranch and adjoining the Indian reservation."

Shasta.

J. L. Cannon, who recently leased the Three Sisters mine, near French Gulch, took out forty-five tons of ore in two months, netting $3600.

Supt. Frick is developing the Deaken & Taylor mines at Lower Springs.

Crowell and son, owners of the famous Banghart group of mines on Mad Mule have expended considerable money in placing their property in good condition.

Courier: At Harrison Gulch experiments are being made with the cyanide plant under the supervision of Mr. McGregor and it is said that the proceeds from the tailings alone will pay the expenses of milling all the ore. Should the small plant now in operation prove as successful as it promises it will be replaced by a ten-thousand dollar plant in the Spring.

Sierra.

The *Sierra Valley Record* says that things look brighter. The Sierra Buttes and another mining company will run twenty stamps each. Copeland, in Slug canyon, will be running five stamps and the Sierra Gold Company twenty stamps.

The Bunker Hill Mining Co. has levied an assessment of 9 mills per share.

The Gold Bluff mill is now in charge of Geo. Black. Tributers' ore is being crushed.

Regarding the road from Sierra City to Cisco, W. H. Freeman of the latter place assures the *Enterprise* that as soon as the opportunity offers he will certainly complete the road. There are three miles to build; seventeen miles have been built.

Siskiyou.

A Delta dispatch says men from the gold strike, twelve miles from there, say that a good quartz ledge is being worked, giving high in free-milling gold.

The Barnes ledge on Cherry creek is being operated by Hunter & Co. Morrison & Lash on the North Fork of Humbug will continue development work all winter. The formation is porphyry and granite contact.

Work on the Klamath Flume and Mining Company's property has been temporarily suspended, but will be resumed within sixty days. Mr. Day, the president of the company, is equipping a large placer property on the Olalla river in Douglas county, Oregon, and wishes to devote all of his time to the latter until it is in running order which will be by the first of November.

T. J. Nolton, after spending considerable time and money in developing a tract of placer ground, to show to intending purchasers, suspected that the owner, an Italian, was salting the ground. After several days of additional work in which the Italian was not allowed to assist, Mr. Nolton's suspicions were confirmed. Several kinds of gold were found in one pan, some of it touched with quicksilver, and fine gold was found sprinkled on the surface of the ground.

Work is progressing on the Klamath Chief group of mines, located in the Cottage Grove district. A three and five-eighth mile ditch which is to bring 1000 inches of water from Coon creek onto the property is under way. Fifty men are at work under Superintendent J. C. Wood.

Trinity.

J. Frank has bonded the Jumbo mine on Virgin creek and has ten men developing a 9-foot ledge.

The Paulsen-Hughes mine, Union Hill, Dutton creek properties are reported sold by P. M. Paulsen, to a company represented by O.

H. Simonds of Redding. This group forms the largest deposit of gravel under one ownership in the county, comprising 1500 acres of auriferous gravel, which carries coarse and fine gold averaging $17.50 to the ounce. Where prospected, its estimated average yield is 15 cents to the cubic yard.

Tuolumne.

From Jamestown is reported a strike in the Green mine, of a 4-foot vein of ore, giving high assays.

Independent: The new 10-stamp mill on the Riverside will be run by water power obtained from the Stanislaus river. Superintendent, F. Plank.

The Confidence continues to look well. The new mill is turning out bullion.

At the Alabama crosscutting is now going on on the 300-foot level. The ore averages $11 per ton.

At the Lewis mine Scott Bros. have recently made a rich strike.

Yuba.

J. C. Campbell proposes to add five more stamps to the battery of the Klondike mine, two miles from Brownsville. The ledge, 8 feet in thickness, carries $2 per ton in free gold. The sulphurets go 5 per cent and yield $65 to the ton.

NEVADA.

EDITOR *Enterprise*:—In your issue of the 25th you published what purports to be an official statement of the results obtained from the working of some low-grade Con. Cal. & Virginia ore at the Kinkead mill. As the test was made for the information of the Con. Cal. & Virginia Co. and its stockholders, I think it right and proper to publish both sides of the question. The official statement shows ore to be worth, as per battery samples, $7.25 in gold and $5.38 in silver, computing the silver at $1.29 per ounce. If the Con. Virginia assays are correct, I only recovered about 53 per cent of the value. But my own assays showed a value of $4.77 in gold and $4.50 in silver, and that I recovered 86.81 per cent of the gold and 54.50 per cent of the silver, a total of 71 per cent of the gold and silver. The battery samples were taken in the usual way, dried, and fairly divided between the Con. Virginia Company and the mill company. The result of the assays showed a wide variance, to wit: Con. Virginia assays $12.68, Kinkead's $9.28. I then sent the samples to San Francisco, where they were assayed by Falkenau, who returned an average value of $9 57 per ton, which practically checks our work and justifies me in saying that we recovered 71 per cent of the assay value.

Yours, JAS. H. KINKEAD.

Virginia, Nev., Sept. 25, '97.

Enterprise: It is many years since the Comstock has witnessed so much concentrated activity as that now in progress about the plant of Harris, Blood & Co. in Six Mile canyon. Since the 23rd of August, when active operations commenced, on an average twenty-five men have been constantly employed. About 4000 feet of flume and ditch have been constructed. This system raises the water so that a fall of 180 feet is secured at the works. It is expected that the plant will be in full operation by the 25th of next month, when it will have a capacity of 130 tons per day.

OREGON.

The property of the Apollo Mining and Milling Co. is in Pearl mining district, Elk creek, Jackson county, forty-five miles northeast from Central Point. The company intended putting in their mill this fall, but has postponed that till spring. They will keep men at work all winter, building roads, bridges, tramways, store house, assay office, etc.

Woodcock & Taylor have sold their placer ground on Briggs creek, Josephine county, to J. C. Franks of Alameda. The property will be equipped with hydraulic appliances. A new ditch one and one-half miles long will be built.

Conde & Locke have bonded the Magnolia mine, Granite district, for $40,000.

In Jackson county Whipple & Holcomb are fitting up a hydraulic plant at their mines on Jump-off-Joe. The Black Gold Channel Mine Co. will put in 2000 feet of hydraulic pipe on their property on Foots creek. The Eureka Mining Company have received their forty-ton mill at Grants Pass. Smith & Beer are equipping a large hydraulic plant on the East Fork of the Illinois river, Josephine county, to cover six miles of ground on the river. Three giants will be operated on this property. The ore from the Oro Fino on Jump-off-Joe is now going to the Ashland stamp mill. The old combination mill and arrastra used for so long at this mine went to pieces recently. The owners propose putting in a 10-stamp mill.

WASHINGTON.

At Chewelah the force of men on the Copper King has been increased. They are drifting both ways from the bottom of the 80-foot shaft.

Ellensburg *Capital*: L. H. Jansen is down from the Swauk with a lot of nuggets, the largest of which weighs sixteen ounces and is worth $240. The next in size is worth $128, and the other eight range down to $20, the lot of a little over fifty ounces being worth about $800. They are from John Black's claim.

BRITISH COLUMBIA.

(Special Correspondence).—B. R. Brierly of Seattle has finished prospecting the British Columbia Mining and Development Co.'s hydraulic ground on Wolf creek and has gone to Seattle via Quesnelle Forks. It is understood that the property makes a satisfactory showing and development will be vigorously prosecuted. Jack Pinkerton has bonded his placer holdings on Lowhee creek for $40,000 to Edgar P. Rothbone, the expert for English capitalists. A cash payment of $1000 was made. The latest strike is on Jubilee creek which flows into Little Valley creek from the east. The gold is coarse. The heaviest piece so far found is worth $20. The discoverers Neigesen, Campbell and Taggart are running a tunnel to the bottom of the ground.

The locating party sent out by the Black River Exploration Co. took up and prospected one and one-half miles of placer ground on Mason creek, Omineca district. If the ground is one-half as good as the locators say it is, it will pay as big dividends as any placer in British Columbia with a very moderate cost for equipment.

Jack Kavanaugh, formerly of Angels Camp, was one of the B. R. E. Co. party.

Charles McKinnon got a $69 slug on Lost creek this summer. Several good mining interests ranging from prospects to dividend paying mines can be had dirt cheap from owners who want to go to Klondike.

Barkerville, Cariboo, Sept. 21, '97.

A Boise, Idaho, dispatch of Oct. 1st says: "Advices received here tend to confirm the reported deal for the sale to an English syndicate of the famous Rossland mine, the Le Roi. The officers of the company at first pronounced the story false, but it is now learned that a deal is really on, and that the amount involved is $5,000,000. Colonel I. N. Pelton of Spokane and Senator Turner of Washington will leave at once for England, it is said, to close the deal. An examination of the property has just been completed by Edgar Rathborne and W. Hamilton Merritt, and their report is said to be favorable. It is rumored that a number of smaller mines near the Le Roi will be included in the deal."

A Sandon special to the *Kootenaian* says the Last Chance mine and group, owned by E. H. Thomlinson, F. A. Wood and Dr. Hendrix, has been sold. The figure was $225,000, practically cash. Scot McDonald, manager of the Payne, and a Mr. Biggerstaff acting presumably for the McCunes, were the purchasers. The mine was examined this week by Mr. McDonald and the deal was closed on the day of examination. The actual transfer has already taken place and Mr. McDonald s now in charge.

Supt. Field of the Wonderful Mining Company in the Slocan figures that were the entire output of that mine for the past thirteen months put upon the market at present prices he would receive only $2581.93 less than at the best figures of a year ago. Calculating the Wonderful output at the best prices of a year ago, silver at 66 cents per ounce and lead at 2¼ cents per pound, which is at the rate of 3 cents less duty of three-quarters of a cent, the mine produced 535 tons of ore, which yielded silver and lead as follows, calculated at highest prices:

62,171 ounces silver at 66c	$41,032 86
732,604 pounds lead at 2¼c	16,483 69
Total	$57,516 55
Average value per ton	107 50

Taking the present market prices and making the same calculation, the tariff on lead 1⅛ cents, the price is now 4 cents per pound, which leaves the net 2¼ cents. There is a reduction of $2.50 per ton on freight.

62,171 ounces silver at 56¾c	$35,282 02
732,604 pounds lead at 2¼c	18,315 10
Freight saved on 535 tons at $2.50	1,337 50
Total	$54,934 62
Average value per ton	102 68

He says Slocan mines can stand a reduction in silver to 40 cents and still show profits.

The Supreme Court has decided in favor of R. T. Daniel in his suit against the directors of the Gold Hill Mining Company, taxing the costs to the latter. This is the case in which the directors attempted to dispose of the Gold Hill mine to themselves by selling to the brother of the president, thereby shutting out the stockholders. Daniel, one of the stockholders, took the case to the Supreme Court. The case hinged largely on whether property owned by foreign companies in British Columbia was controlled under the laws of the country in which the company was organized or the laws of British Columbia. This decision determines that henceforth the operation of all foreign companies must be governed by the British Columbia statutes.

In Slocan more men are being taken on at the Whitewater mine. It is the intention to have ninety men at work before winter.

The galena property on Ten Mile, the Enterprise, near New Denver, was closed down this week, and forty men are out of employment. Supt. Covington says the mine will soon be reopened on a $3 a day basis.

At Trail creek the Monte Cristo mine has shut down.

The Fern mine, three miles from Hall's siding, is a free milling property, and the machinery now in course of erection is among the largest in British Columbia. The battery, which is 32x40 feet, includes twenty stamps and eight vanners, with ore bin 24x4 feet. The boiler has a capacity of 240 H. P. and supplies a driving engine of 165 H. P. The machinery is supplied by the Union Iron Works of San Francisco, and is being erected under the supervision of F. M. Barr. Forty-five men are employed under Supt. Veitch. The mine itself is situated quite close to Hall creek, so that at certain seasons water power sufficient to drive the battery will be available. At present 1300 feet of work has been done on the mine, including two tunnels of 350 and 500 feet respectively.

The Golden *Era* thinks the provision in the mining law which gives claim owners the privilege of commuting assessment work, by payment to the public treasury of a sum equivalent to the cost thereof, is one of the most mischievous enactments of a Government famed for the trouble-breeding tendency of its legislation. Our contemporary very properly says that the country wants development of its mineral resources, and that any provision which enables claim owners to escape development work is "against the best interests of the mining industry." The man with money is given an advantage over the man without money. We are not aware to what extent this provision has been taken advantage of. Claim owners would surely prefer to expend $100 a year upon their claims rather than pay that sum to the Government and have no development work to show for it. Nevertheless, the regulation is an invidious one, and cannot serve any good purpose. Its only effect when taken advantage of must be to reduce the amount of development work, and to that extent poor men are deprived of work which they would get if there was no commutation provision.

Rossland *Miner*: The Hall Mines smelter, under the direction of R. Hedley, is making a record. One day during the past week 272 tons of ore were smelted. The only trouble encountered has been in the granulation of slag, the water not being sufficient to properly take care of this. A large amount of blister copper has been produced and started for its destination at Swansea, Wales. Both the roasting and calcining furnaces have been kept busy producing copper.

ALASKA.

T. S. Nowell, president of the Berner's Bay Mining and Milling Company, speaking of the quartz gold-bearing vein at Berner's bay, says the ledge averages 32 feet in width and has now been traced 4000 feet. The mill test of ore taken from the ledge runs $50 to the ton on an average. The new discovery will necessitate the enlargement of the stamp mill.

Record: The Nowell Gold Mining Company keeps two giants constantly turning over the gravel in their Silver Bow basin placers. The bank increases to 100 feet in thickness as Ice gulch is approached. In former years the old miners worked some very rich ground in that gulch, but the depth of gravel was too great for them to reach the bedrock by their methods of shoveling in and with no outlet for tailings.

The stamp mill at Funter bay is now running, former delays that arose having been overcome, and new developments on the Boston & Alaska Company's properties at that place will now go ahead. The mill will be enlarged and a working tunnel to tap the veins started in from the beach.

In the Bald Eagle mine at Sum Dum the tunnel is now in 1800 feet, and a body of ore ranging from 5 to 7 feet in width has been opened out. It is the intention to extend this tunnel on into the Sum Dum Chief, the extension above, and there attain a depth of 2000 feet on the vein. A new mill of ten or more stamps will be erected on the beach—a distance of two miles from the mouth of the working tunnel, the two to be connected by a traction tramway.

The Treadwell (Paris) now has a depth of 225 feet, of which 150 feet is below sea level, and the body of ore exposed is of such great extent that it is found expedient and necessary to double the capacity of the present enormous plant to one of 280 stamps. The Mexican has attained a depth of 220 feet below the working tunnel, and development work on the Ready Bullion has reached a depth of 500 feet. The deepest workings in Alaska are in the Comet mine at Berner's bay, a crosscut tunnel about 1700 feet in length tapping the vein 1000 feet deep. The Kensington vein in the same locality will in the near future be cut at the 1400-foot level. The workings on the Glacier and Silver Queen mines at Sheep creek have reached depths of 350 feet. The shaft on the Bald Eagle mine at Sum Dum is 350 feet deep, but the working tunnel continues on, and a much greater depth is now reached. This tunnel will be driven on into the Sum Dum Chief and a depth of 2000 feet reached on the vein.

THE KLONDIKE.

The steam tug Holyoke, at Port Townsend, Wash., Sept. 29, eighteen days from St. Michael, reports that the statement that there are three tons of gold at St. Michael awaiting shipment to the Sound in the steamer Portland is untrue: that unless the gold arrived from Dawson after the tug sailed, very little will be brought down before the river opens and the boats get down next June. Travel from St. Michael up the Yukon was still going on when the Holyoke left, but the river was not expected to remain open longer than between the 1st and 10th of October. People at St. Michael are well provided with the necessaries of life for winter and many of them are engaged in building boats which will be operated on the river next season.

UTAH.

R. C. Chambers, in speaking of the recent advance in silver quotations, states that this will have no effect on the Ontario company in the way of resuming work at the mine, unless silver should go to 70 or 75 cents.

Park *Record*: It is becoming more evident every day that the time is not far distant when silver will be rated here, as in Butte, Montana, simply as a bi-product. In ten years from now Park City will be as noted for its copper and gold production as it is now for its silver and lead.

Mercur *Miner*: The semi-monthly shipment of cyanides from the Geyser-Marion this week amounted to $8,400.

Tribune: Philo T. Farnsworth, who has just returned from the Horn Silver, of which he is the manager, says the output of the old bonanza, which has paid over $5,000,000 to its stockholders, while disbursing nearly that amount for supplies and among those employed upon it, has been steadily increasing since the advance in lead began, and that he hopes to keep it up steadily. At present he is sending out about 1200 tons of ore per month, which, with the advance in the lead market, is earning the company a good margin; and should silver advance, the mine will be in as good condition as at any time in its career. Of the property of the Austin Mining Company, Manager Farnsworth says the mill is operating with perfect satisfaction, and that the property is on excellent foundation at this time.

The Bingham *Bulletin* says that a series of leaching experiments, made during the past month by H. G. Bowdich, have been attended by what appears to be important results. He has a miniature leaching tank charged with 200 pounds of dirt scraped from the surface of the All's Well copper claim. The stuff was first assayed by Cowan and found to contain about 4½ per cent copper. In a precipitating vessel loaded with scrap iron, under the tank, were several pounds of copper, which had also been assayed, and the certificate showed it to be 86 per cent pure. The run was not fully completed, but evidently a five-pound ingot will be obtained from the 200 pounds of ore. Mr. Bowdich seems to have accidentally discovered a new combination of chemicals, else he is utilizing an old and disused one, the most expensive ingredient of which is common salt, with which he can extract the mineral from oxidized copper ore for an incredibly small sum. Thus, the cost of leaching the 200 pounds was 12½ cents, though the fluid agent, after precipitation, can be used over and over again by simply adding to it. Mr. Bowdich claims it is so powerful and searching that it will readily dissolve and leach dirt as coarse as fine gravel, barring base matter, and that to prepare ore for the tank it is only necessary to run it through rolls. He concludes that if a plant capable of treating fifty tons per day were operated, the extreme expense need not exceed 45 cents per ton.

IDAHO.

At the Bunker Hill & Sullivan, Kellogg, when the new air compressor at the mill is finished an electric plant will be put in there and the power to light the mine will be generated at the mill.

The Yellow Jacket 60 stamp mill at Yellow Jack creek, fifty miles west of Salmon, has been idle for eight months, owing to a miners' strike. Forty men at the mine are doing development work.

F. D. Howe, manager of the Hidden Treasure mine at Neal, says a 10-stamp mill is to be erected on the property at once. Later, a cyanide plant will be put in.

Hailey *Times*: The cyanide works at the Camas No. 2 are in successful operation; the first lot of forty-five tons put through the tanks yielded 90 per cent. There is an excess of ferric sulphate and of sulphate of copper in the tailings. The iron obstructed the action of the cyanide and the copper had a tendency to precipitate. Metallic copper was found in the wash water. It was liable to coat the pipes and make base bullion. To offset this and prevent the copper from coming into contact with iron the pipes were lined with rubber paint. The works will leach forty-five tons of tailings per day. There is about $1 worth of silver in the ton of tailings; but no special effort is made to save over 50 per cent of this. There is about $6 in gold per ton, and 90 per cent of this is saved. The product is, therefore, between $200 and $250 per day—of which $200 or thereabouts is profit to the Recovery Company and the owners of the Camas No. 2.

Thompson and Cusic, of Butte, for Snake river placers have automatic concentrator of grizzly, a smooth steel plate perforated and counter reamed on the under side. In ground sluicing the fine gold and black sand passes through the grizzly into a sub-sluice or undercurrent. The concentrates then flow over copper plates, when the undercurrent forces them through a hopper and then to a tank. Two diverting blades of copper are placed opposite the feeding hopper on the floor of the tank, over which is placed a half disc, the circular edge of which is set above the mouth of the hopper, the straight edge sloping downward toward the bottom of the tank, and practically submerged in quicksilver. By this means all the concentrates are passed under the disc, and are drawn upward through the quicksilver by the blades of the sand elevators which drive the sand into the top of the tank. The sand is skimmed from the surface of the quicksilver and carried to the tail sluice. At the top of the tank there are four side plates at equal distances, the water circulating around the tank by the motion of the elevator blades, which create an eddy between each of the plates and forces the water and sand to the quicksilver again. The half disc, side plates, elevator blades and full disc which cover the top of the tank, are all plated to catch escaping particles of gold. The larger machines will operate directly on the end of the ground sluice or tail-race, working automatically. Driven by horse, steam or water power, it is estimated that the machine will work 50 to 1000 cubic yards per day. A working model is exhibited in Walkerville, Montana.

MONTANA.

The Toledo Mining and Smelting Company's smelter at Brandon is now running. An examination into the cause of the trouble showed that the smelter was all right, but the fluxing was all wrong.

At Sylvanite fifty men are at work on the gravity car line and Gold Flint mill. The mill will commence operations November 1. The Gold Flint is opening up a 100-foot level. The vein has been cut across 12 feet, all in ore, and the hanging wall is yet to be reached.

The new 25-ton concentrator for the Buckeye mine, on Basin creek, about fourteen miles from Basin, is nearing completion and will be in operation within three or four weeks. The mine is now shipping some crude ore to the East Helena smelter.

The southern reserve of the Blackfeet Indian reserve is reported already lined with prospectors awaiting the proclamation of President McKinley restoring that area to the public domain. There are reported to be 200 on the border, three-fifths of whom know where to jump to when the news of the opening of the reserve should be heralded. If the opening day is not announced before spring, much suffering will be the lot of many of the men, as they are not prepared to withstand the winter season there.

The Butte *Miner* reports that the Diamond Hill mine, in that section, is producing. Eighty men are employed. B. F. Fisher, late

of Grass Valley, Cal., is superintendent, and he has installed a satisfactory cyanide plant.

SOUTH DAKOTA.

Pioneer: It looks as though the Harney Peak Tin Mining & Manufacturing Co., unlimited, was going to take the advice of Dr. McGillicuddy and Prof. Smith to "get all the machinery together at a central point, put it in repair and sell it." This, with a number of splendid ranches owned by the company, seems to be all the available assets for an expenditure of some two and a half million dollars. This expenditure was made largely upon the report of Prof. Vincent, the eminent expert, who was probably mistaken in his conclusions. During the days of its promotion, Rapid City people declared that there was "enough tin in the Harney Peak mines to roof the entire vault of heaven."

COLORADO.

Denver branch mint gold bullion receipts have been computed for nine months of '97. The receipts during September aggregated $1,149,365 59; during September, 1896, $443,-356.74. During the nine months from January 1 to September 28 the receipts aggregated $8,388,088.56; for the same period of 1896 the aggregate amount was $3,128,436.16.

A Denver special says Leadville representatives are there to get the various railway lines going into Leadville to reduce the rates now in vogue for the transportation of ore. The present rate on ore valued at $100 per ton and less is 22½ cents. The low price of silver cuts off the profit, and if not remedied several of the Leadville mines must stop operations. It is believed the Rio Grande, Midland and Gulf roads are disposed to make the desired reduction.

The production of Cripple Creek is said to be by those well informed still far in excess of the reduction capacity. The Victor, concerning whose enormous output it is unable to market, much unfavorable comment has been excited, produced 12,000 tons of ore last month without stoping, and none of this, or practically none, can be treated at the Florence works, because of the glut of custom ores.

Speaking of the condition and prospects of the Argentum-Juniata mine, Aspen, Colo., Manager Palmer states that during the past year there has been put in the mine two triple expansion pumps of a capacity each of 1000 gallons a minute under 1000 feet vertical lift. These handle the water most satisfactorily, the flow being 1020 gallons a minute on July 1, '97, as against 760 gallons on July 1, '96. The average water flow for the year was 825 gallons a minute. There were 5004 feet of development work performed and 480 sets of timbers put in, covering 2223 feet of workings. The gross value of the ore taken out of the mine was $138,930.48, and the net cash value, after deducting sampling, smelter and railroad tolls, reached $103,121.64. The total tonnage was 4,203,016 and the average net returns per ton was $24.54. The cost of operating the property was $178,155.78, The net loss to the company for the year was $67,249.76. The resources of the company are placed at $2,801,885 97, property interests being valued at $2,628,929.89 and a cash balance of $24,476.31. The credit balance July 1, '97, is $189,495.53, as against $256,790.29 July, '96.

The net smelter and mill earnings by the Elkton Consolidated Company for August are shown by the following table:

	Grade.	*Gross.*	*Net Returns.*
153¼ tons	1 and 2	$24,529 20	$22,154 45
695 3-5 tons	3d	20,837 20	13,604 61
2 cars	1 and 2	.....	$ 4,000 00

* Estimated.

Total net returns, $39,759.06. Mine operating expenses for August (estimated), $14,000; net earnings (estimated) $25,758.06. The main shaft will be sunk an additional 200 feet.

By a mining deal, involving $175,000, the Portland Town and Mineral Company has passed into the hands of the Gold Knob Mining Company; S. T. Smith is president, N H. Cone manager.

J. Kurrie cables from London that he has succeeded in raising the $275,000 necessary to take up the bond on the Squaw Mountain tunnel, says the Cripple Creek *Times*. It is capitalized at $2,000,000. The tunnel has been driven nearly 2000 feet into the mountain, and, while it has shipped ore of a paying grade, it has never been regarded as a rich producer.

Mining Investor: Miners are expecting better prices for their ore shortly. They hold to this theory from the fact that all the chlorination and cyanide mills that depend upon this camp for ore are increasing their capacity. The Brodie management has lately received instructions from the directory to put in additional machinery and tanks that will practically double the capacity. The works at Gillett are being enlarged. The Page plant, at Florence, will be in the market within the next thirty days. The big mill at Colorado City is constantly adding to its capacity, while the Requa gulch plant has so thoroughly demonstrated that its work is a success that it is said that money sufficient to many times double the plant is ready for investment as soon as the smelting companies that have in the past received some of Cripple Creek's ore have their agent in camp looking out for future contracts, while a smelter that has never heretofore been in the field is now out fighting for business—the Arkansas Valley of Leadville. With all this competition there can be but one result, a cut in the treatment charges. The miner looks on complacently and hopes that the war may be not only a long one, but a hot one as well.

NEW MEXICO.

The value of the output of Hillsboro mines for 1896 was $428,399, an increase of nearly $200,000 in five years. The output for the week ending September 16, 1897, was 115 tons.

ARIZONA.

There are none of the mines at Tombstone now being worked on company account, nothing being done except by chloriders, who are making fair wages. There is at present a demand for fluxing ores, and some business is being done in that line.

Harqua Hala reports that the company who have leased the Bonanza mine in that district have closed down the cyanide works, having worked up all the tailings and on the first of October their lease expires.

Nine copper claims adjoining the property of the United Globe, at Globe, have been bonded by C. A. Cutting of the Old Dominion Copper Company, for twelve months; $40,000 the price to be paid for the property, $2000 to be expended in development work.

Yuma *Sentinel*: Frank Vomicil, on his lead mines in Castle Dome, will start thirty men and will ship fifty tons a week to San Francisco.

CANADA.

The Toronto *World* says it has the best reason to believe the Sultana mine at Rat Portage has been practically sold to English capitalists for a million and a half dollars.

SOUTH AFRICA.

South African *Journal*: Slimes treatment at the Bonanza.—As the slimes-pulp leaves the tailings plant it receives a supply of slaked lime. Hitherto the lime has been fed by hand into the launder, which conveys the pulp to the spitzkasten, separating the more solid contents from the water; the proportion used to be six bags to the 60 to 70 tons of dry slimes produced per day. Now a small lime-mixing machine is used, which has decreased the consumption of lime by 66 per cent. The machine consists of a small water-wheel driven by a stream of water flowing from a pipe of about ¾-inch diameter; the axle of the wheel prolonged into a box, and is set with knife blades capable of taking any angle to the longer axis of the box. Into the box is fed, from a hopper, finely ground lime, the speed of feed being regulated by a feed-pipe which moves up or down vertically, and which provides a larger or smaller crown of lime as the bottom of the pipe is farther from, or nearer to, the bottom of the box. The knife blades throw, at each revolution of the wheel, a small quantity of lime through a door in the bottom of the box into the launder feeding the slimes-pulp into the spitzkasten. The lime serves two purposes: it neutralizes any acid there may be in the pulp; but it performs the infinitely more important work of causing the rapid precipitation of the solid contents of the pulp. The proportion of slacked lime to the ton of solid slimes works out (on the basis of two bags at 175 lbs. to a mean daily output of 65 tons) at obout 5¼ lbs. To allow of the lime being properly dissolved the length of launder is some 100 feet.

The spitzkasten (of 15 compartments) measure about 25 feet long by 15 feet broad by 5 feet deep. The dimensions of this concentrator are a very important factor in the problem of precipitation, for the superficial area is a matter of less importance than the slow speed of the current through it; wherefore comparative breadth is to be sought for more than length. With properly regulated flow, the water overflowing at the end of the spitzkasten is so clear that it is to be returned directly back to the battery for use over the plates.

This detail—the precipitation of slimes by admixture of lime, and the return of the clarified water to the battery—is a matter of importance to every gold mining proposition to which a superabundant supply of clear fresh water has not been vouchsafed; for not only is great economy in pumping effected, but after the water supply has circulated once or twice it will be appreciably alkalized and will be so much the more suitable for battery use.

The clarified discharge from the end of the spitzkasten thus flowing to the mill, the product of the lower discharge runs into a circular vat with peripheral overflow. The settling of the solid portion of the pulp—induced by the mechanical action of the lime—is so rapid that it is accomplished in about 2½ hours, where without the lime it would take not less than 12 hours. This also is a detail of great importance to the gold mining industry throughout the whole world, for it practically amounts to this—that a saving of some four-fifths can be effected in the prime cost of construction in the matter of vats.

After this curtailed interval of settlement, the clear supernatant water is decanted off from the settling vat and finds its way back to the mill service, and the concentrated slimes are pumped into the agitators. Here the KCy solution is mixed (at a strength of from .006 to .008, equal to a consumption of about .2 lbs. KCy to the ton of solid slimes) with the charge and the whole agitated by two bare revolving arms. It is during this period of agitation that air will be sprayed into the charge for the quicker and more perfect dissolution of the gold. At present the necessary apparatus is not at work. In about four hours all gold is dissolved, and the charge is pumped into a settling tank, whence the auriferous solution is decanted off in a state of remarkable clearness to the intermediate clarifying tanks. These are two in number, the lower one containing a sand filter which removes every trace of turbidity. The pellucid auriferous solution is then delivered at the precipitation houses for electrolytic precipitation. It is worth noting that a precipitating box of a different design is used for this work at the Bonanza just now. It has a working capacity (at a first cost of £600) equal to that of four boxes (at £400) of the older type.

The muddy deposit left behind in the settling tank is then treated with a weaker cyanide solution, known as the first wash; some 600 tons of this solution are used daily at this plant, of which one-third reaches the precipitation house, and two-thirds are sent to the tailings plant—where it is used in the preliminary washing of the sands to be cyanided.

During the last dry season the Bonanza had to pay at the rate of £185 a month for pumping charges, in order to secure a proper water service for their mill; to-day under precisely similar conditions, the company is spending £25 a month—thus effecting a saving of £160 a month by returning the water (clarified from slimes by lime) straight from the slimes plant to the mill. Moreover, the slimes process is so successful that there is not the reason which formerly existed for preventing the creation of slimes in milling. Under the old mining method, screening of 400-mesh was used to prevent creation of slimes; the sands reaching the tailings plant were, therefore, comparatively coarse and held a certain proportion of locked-up gold which the cyanide solution could not reach. Under the present method, screening of much finer mesh (1,000) is used, a larger percentage of the gold is caught in the battery boxes; the sands cyanided are finer, and a larger percentage of the locked-up gold is attacked by the cyanide solution; and the only difference is that the proportion of slimes in the mill pulp is 30 per cent now, where it used to be 20 per cent.

Coast Industrial Notes.

—Recent shipments of livestock from southern Oregon are unusually large. The amount of money left in the vicinity of Ashland is $29,500. The cattle were shipped to Cedar Rapids, Iowa, and to Atkinson, Illinois.

—Large naval docks will be constructed at Goat island, at Mare island and at San Pedro, Cal. The cost of such improvements will aggregate about $4,000,000. The docks at Goat island and San Pedro will cost $1,500,000 each and that at Mare island $1,000,000.

—The Alcatraz Asphalt Company expend considerable money in Santa Barbara county, Cal. At their mine in the Sisquoc district, near Gaviota landing, the company will build a wharf, reservoir and other works. They have on hand for the new pipe line 500 tons of pipe.

—The Austin (Nev.) *Reveille* says: Cattle are selling over there at the following prices: Yearling heifers, $10; yearling steers, $13; two-year-old steers, $18; three-year-old steers, $23 50; dry cows, $15; cows and calves, $18, making an average price of $15.50.

—The Santa Rosa and Sonoma County, California, Electric Railway has finished fifteen miles of surveying in the vicinity of Sonoma, but will do no more active work, pending the disposal of $400,000 of its bonds. It is proposed to build seventy miles of electric railroad in Sonoma county, connecting with the shipping point at Embarcadero.

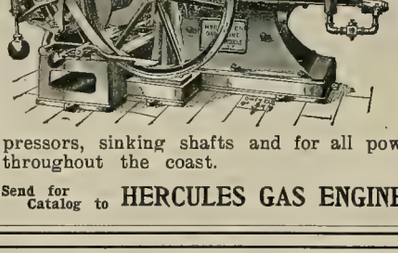
—The first California Limited east-bound will leave Los Angeles on Tuesday, Oct. 26th, going through to Chicago in 71 hours and 43 minutes. Immediate connection will be made at Barstow with sleeper leaving San Francisco on Monday night, Oct. 25th. The train will leave east-bound Tuesdays and Fridays, connecting with trains leaving San Francisco Monday and Thursday afternoons. The train will consist of ten-section double drawing-room palace sleeper, buffet smoker and dining car through to Chicago, also palace sleeper through from California to St. Louis via Kansas City.

—During last month almost $5,000,000 worth of grain left Pacific coast ports for Europe. Thirty-five vessels sailed from San Francisco. Of these 17 carried wheat, 5 carried barley, 12 carried mixed cargoes of wheat and 1 carried 23,025 barrels of flour, which was valued at $115,112. The grain vessels took away 2,200,134 centals, valued at $2,374,760, and general cargoes of canned goods, etc., would foot up another half million. Oregon sent 7 vessels with 352,206 centals, valued at $621,513, and 2 vessels with 50,075 barrels of flour, valued at $200,500, while Seattle, Wash., sent 3 vessels with 160,310 centals, valued at $242,240. Besides these, 28 lumber vessels have sailed for foreign ports with cargoes valued at over $200,000.

—The Union Pacific Reorganization Company proposition for the settlement of the company's debt to the United States will be accepted, the Government mortgage will be foreclosed, the road sold and the company reorganized. The Reorganization Committee will bid for the road under the foreclosure sale, the sum of $45,754,059. The principal of the debt of the Union Pacific to the United States was $35,539,512. A portion of this has not yet been advanced by the United States. The interest paid to the Government amounts to $36,954,893. The whole indebtedness on the first day of July, 1897, was $70,494,405. The sinking fund of the Union Pacific in the hands of the treasurer of the United States on the same day was $17,738,209. After deducting the sinking fund, which is an asset of the company in the hands of the United States for the purpose of paying the debt of the Union Pacific Company to the Government, the sum of $28,015,805 remains to be paid. That is the only sum which Fitzgerald's Reorganization Committee will be required to pay the Government. The loss to the Government is the difference between $53,000,000, the net amount due the Government in round numbers, and the $28,015,805, making a loss of nearly $25,000,000.

—Siberia's railway time between Tscheljabinsk and the bridge over the Obi, 930 miles, is fifty-one hours. Fare: first-class, $39; second-class, $23.25, and third-class, $15.75. As often happens in Russia, the travelers bring their own beds and samovars, or tea urns, with them, besides other articles. Refreshments are supplied by the peasants of the neighborhood region, who come down to the stations with bread, cheese, butter, meat and baked fish. As one-third part of this gigantic railway is now ready, $150,000,000 out of the estimated general cost of $345,000,000 has been spent. Colonization has greatly increased along the line, and the hope of the Russian Government is being rapidly fulfilled, that the cultivation of the swampy Taiga district on both sides of the line will proceed. There is no data as to the influence of the construction of the line upon trade; there can, however, be no doubt that this influence does exist to a considerable degree, as also an influence for good as regards the administrative system in Siberia. Its importance from the point of view of transporting troops is clearly seen from the fact that Russia at this moment has in eastern Siberia alone an army of 60,500 men.

Hercules Hoisting Engines



Solve the difficulty of fuel, and make mining profitable where steam power is too expensive. Over 3000 Hercules Gas and Gasoline Engines are in use giving entire satisfaction. Fully guaranteed. Requires no engineer. No smoke, no dirt. No danger.

We build engines from 2 to 200 h. p. for pumping, hoisting, running air compressors, sinking shafts and for all power purposes. Used in mines throughout the coast.

Send for Catalog to **HERCULES GAS ENGINE WORKS,** 217 BAY ST. San Francisco, Cal.

MINING MACHINERY, Second-hand.

Union Iron Works,

222 MARKET STREET,

SAN FRANCISCO, CAL.

This

Three-Stamp Iron Frame Battery

WAS MADE BY THE

UNION IRON WORKS

FOR THE

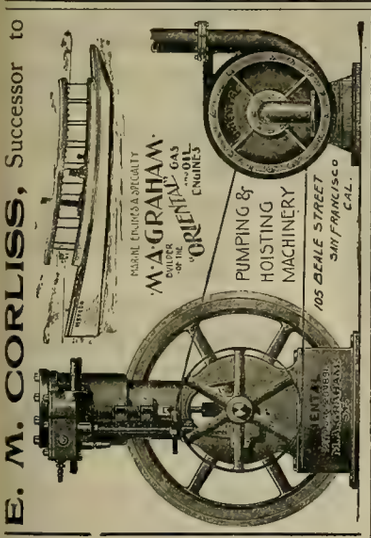
NEVADA METALLURGICAL WORKS.

The stamps weigh 350 lbs.

The total weight of the battery is 5000 lbs.

The weight of the heaviest piece is 1300 lbs.

Capacity, five tons per day.



E. M. CORLISS, Successor to

W. & P. Insulating Coating.

Water, acid and alkali proof. Unaffected by gases, fumes, or moisture. An absolute non-conductor of heat or electricity.

Unequaled for electrical work of every kind. Excellent for floors, sinks, trays, vats, tanks, refrigerators.

Equal to paraffine as an insulator, and more convenient. Odorless when dry. Hardens in from five to twelve minutes.

Can be used in safety in confined places, as it contains no bisulphide of carbon, ether, or other poisonous ingredients.

Barrels, 75c; Five-Gallon Cans, 80c.

STACK AND BOILER PAINTS, ROOF PAINTS, READY ROOFING, ROOFING FELT, ROOFING COMPOSITION, COAL TAR, BUILDING PAPER.

Specify W. & P. Can be Ordered of Dealers.

THE EDISON GOLD SAVING MACHINE.

The Most Complete Machine in the World for

GRAVEL WASHING.

Guaranteed to Save Every Particle of Flour and Flake Gold, and Floured Quicksilver.

WILL HANDLE 3 TONS OF GRAVEL PER HOUR.

Minimum power and water required. Requires but one handling of gravel. By motion of machine water is returned and used over and over again. Light, durable and easily transported. Simple in construction and inexpensive.

The EDISON MACHINE COMPANY,
ALBUQUERQUE, NEW MEXICO.

GOLD IN COLORADO!

Colorado has within its limits some of the greatest gold mines that has ever been discovered. In Cripple Creek in 1892 there were a few prospectors looking over the hills; in 1895 the camp turned out over $8,000,000 in gold. Leadville, the old bonanza camp and the mineral product of which made Denver what it is to-day, is becoming a big producer of gold. New inventions for working low-grade gold ores, together with the discoveries made to work rebellious ores, have opened up a field for the miners such as they have never enjoyed before, and Colorado has inducements to offer such as no other district in the world possesses; the record of the State in gold production for the last three years speaks for itself. Among the other prominent camps in the State are Telluride, Ophir, Rico, Silverton, Mineral Point, Durango, La Plata, Ouray, Saw Pit, Ironton, the Gunnison district and many others. New finds are being made and new camps are springing into existence every day. The Denver & Rio Grande Railroad, which is the pioneer road of Colorado and which has always been the miner's friend, reaches all the mining camps in Colorado. For elegantly illustrated descriptive books, free, of mines in Colorado send to

Denver Engineering Works Company,

DENVER, COLORADO, U. S. A.

The COLORADO IRON WORKS CO., Denver, Colo.,

ENGINEERS AND MANUFACTURERS,

Beg to draw your attention to the introduction of the . . .

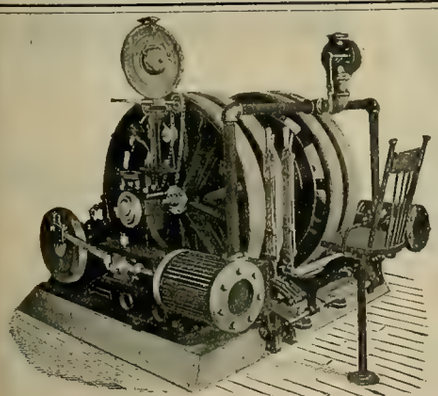
FINLAYSON PATENT WIRE ROPE TRAMWAY.

It is of the double rope pattern and the newest and best thing in its line ever placed on the market. The automatic features, simplicity of construction, ease of running and economy in operation places the

Finlayson Tramway

far ahead of all other systems of aerial ropeways. It is unsurpassed in tonnage capacity. It is on the principle of "You push the button and the machine does the rest." If interested send for special catalogue.

Our Line of Manufactures includes all kinds of Modern Equipments for the Successful Milling and Smelting of Metalliferous Ores. Special Catalogues on Application.



10 x 12 LIGHTNING QUADRUPLE FRICTION HOIST.

Whatever is popular deserves attention.—*Thackeray.*

Unquestionably the Most Popular Friction Hoist in the Market is the

Bolthoff Lightning Quadruple Friction Hoist.

Requires less power to apply and gives better contact for friction surfaces than the double friction types. By carrying the brake band between the frictions the strain is reduced to a minimum.

COMPLETE HOISTING OUTFITS CARRIED IN STOCK.

A 294.6 M G.

The use of this weight is to facilitate the present volumetric method of manganese determinations where the titration is done with the standard 1 per cent permanganate solution for iron.

By taking this amount (294.6) Mg. the final results can be read from the burrette, 1 c.c. equals 1 per cent, thereby saving all further calculations and reducing the liability of mistakes to a minimum.

Made of platinum, and weight guaranteed.

Price, $1. Sent postpaid on receipt of price by

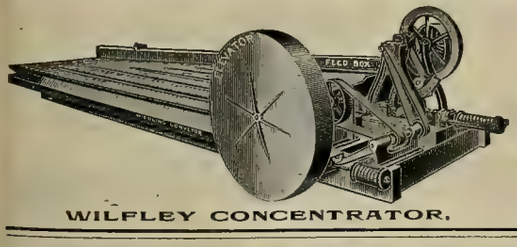
SOLE AGENTS IN CALIFORNIA FOR THE CELEBRATED

WILFLEY CONCENTRATING TABLE.

One of these machines will take the place of two or three belt concentrators of any style and do very much better work.



WILFLEY CONCENTRATOR.

SEND FOR CIRCULARS.

Some Practical Reasons Why the Wilfley Concentrator Should Be Used in Gold Mills:

1. It will successfully handle three or four times more material than any belt Concentrator made, barring none.
2. It will save more sulphurets in proportion while so doing, and catch any float gold, amalgam or quicksilver which may escape from mortars or plates.
3. It will make cleaner and much more valuable concentrates, thus saving useless expense for transporting valueless material, as also extra cost for treatment.
4. It requires little or no attention when once adjusted and no expert is required to either adjust or run the machine.
5. It will save much expense in power and room, and the first cost of a mill requiring concentrators.
6. It has no expensive belts to crack and wear out, nor complicated machinery to keep in repair.
7. It is the only sensible plan of concentration, as any kind of material can be worked, which is not true of any style of belt machine.

THE BEST BOOKS

Are always the **CHEAPEST.** All the latest and best works on **Mining, Metallurgical, Electrical and kindred subjects** can always be obtained through the office of the MINING AND SCIENTIFIC PRESS. Below will be found a list of standard books in their various lines. If you do not find what you want in it, send for catalogue and price list of **Standard Mining Works and Scientific Publications.**

MINING AND SCIENTIFIC PRESS,
330 Market Street.....San Francisco, Cal.

Assaying.—Part I—Gold and Silver Ores.
Third edition; Just Out. Rewritten and Improved by the Author, C. H. Aaron. Embraces 130 12-mo pages, with illustrations; well bound in cloth; 1896. Price, postpaid.....$1 00

Assaying.—Parts II & III—Gold and Silver Bullion, Lead, Copper, Tin, Etc.
Latest edition. Contains 161 pages with illustrations, and is strongly bound in cloth. Much of the original text is replaced by new matter. Price, postpaid.....$1 75

Prospector's Field Book and Guide.
By H. S. Osborn.....$1 50

Roasting of Gold and Silver Ores and the Extraction of their Respective Metals Without Quicksilver.
Second edition. By Guido Kustel, M. E. Contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. Price, postpaid.....$3 00

Modern Copper Smelting.
By Edward Dyer Peters, Jr. Seventh edition. Rewritten and enlarged. Profusely illustrated.....$5 00

Practical Treatise on Hydraulic Mining.
By Aug. J. Bowie, Jr. On the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on heavy grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. Price, postpaid.....$5 00

Practical Hydraulics.
A book for Civil Engineers, Miners, Millmen, Hydraulicians, Mining Engineers and Irrigators. By P. M. Randall. Contains useful tables for ready reference, in which the results of abstruse calculations are all placed in a form so that one can find what he wants in a moment. For the engineer the principles, formulæ, coefficients, etc., are given; and for those not familiar with higher mathematics, examples, rules and tables are prepared. Is specially applicable to the Pacific Coast. Price, postpaid, $2

The Explorer's and Assayers' Companion.
A third edition of selected portions of the "Explorer's, Miner's and Metallurgist's Companion." By J. S. Phillips, M. E. A practical exposition of the various departments of Geology, Exploration, Mining, Engineering, Assaying and Metallurgy. Price, postpaid.....$6 00

The Metallurgy of Gold.
By M. Eissler. Profusely illustrated.....$5 00

Notes on the Treatment of Gold Ores.
By Florence O'Driscoll, Associate Member of Institute of Civil Engineers. 8vo., cloth.....$2 00

Cyanide Processes for Gold and Silver Ores.
By E. B. Wilson, E. M. 12mo., cloth.....$1 50

Quartz Operator's Handbook.
By P. M. Randall.....$2 00

Skeleton Mining Report.
Of great practical value to miners and mine owners in making a comprehensive report on mining properties. Useful and convenient to mining engineers as a field notebook. Price, postpaid....50 cts.

Stamp Milling of Gold Ores.
By T. A. Rickard, M. E. An actual record of milling practice in this and other countries. Deals with the erection and management of mills, and contains many helpful suggestions to those interested in the extraction of gold from its ores. Well illustrated. Cloth. Price, postpaid.....$2 50

Miners' Pocketbook.
A reference book for miners, mine surveyors, geologists, mineralogists, millmen, assayers and metallurgists. By C. G. Warnford Lock. 472 pages, illustrated, flexible leather.....$5 00

THE GUTTA PERCHA AND RUBBER M'F'G CO.

30 and 32 FREMONT ST., SAN FRANCISCO.

Spadone's Concentrator Belts. Patented.

The "SPADONE" Curved Edge Concentrator Belt is attracting much attention among mining men, its merits appealing to the millman of practical experience.

Illustration (Fig. 1.) shows a cross-section, and (Fig. 2.) shows the edge flanging outwardly as it passes over the pulley. This relieves the strain from the top and bottom of the edge by directing the strain automatically to the inside face surface of the edges. Heretofore all belts have been so constructed that when they pass over the pulleys or rolls, a direct strain comes upon the top or at the base of the edges, causing the edges to break away from the body of the belts in a very short time. *We avoid this Mechanical Defect by our Spadone Curved Edge.* Belts made to fit any machine—4, 5 and 6 feet wide. Prices and samples on application.

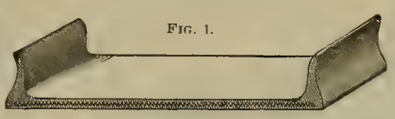

FIG. 1.

Market Reports.

The Markets.

SAN FRANCISCO, Sept. 30, 1897.

Importers and manufacturers' agents report the jobbing trade taking quite freely in almost all lines. They state, also, that jobbers are disposed to carry more in stock. The distributive demand in about every line is largely in excess of that ruling at the corresponding time last year. The improved business is reflected in larger bank clearings, which aggregate from 20 to 40 per cent more than at similar dates in 1896. As there is no speculative movement in anything more than last year, the increased clearings show the improved condition of trade. With manufacturers, so far as we are able to learn, the feeling is one of great confidence in the future. They hold to the opinion that their business will be larger next year than before known. Some, it is stated, are enlarging so as to better handle the expected business. Active railway construction and large improvements in other directions are favorably commented on for next year's business.

The local money market is working on easy lines. The disposition appears to be to put out more money, and therefore approved loans can be placed more advantageously than a short time ago. This, no doubt, is actuated by accumulating funds in banks, with very little call for accommodations, and the present outlook is favorable for a continuation of funds accumulating. There is nothing as yet in sight calculated to promote much of a speculative or investment demand for funds. There is a good inquiry for good to gilt edge bonds. The imports of gold from Australia cause stiff rates to rule for exchange at New York, notwithstanding free shipments of produce to the East. New York mail advices report: "The money market is quite brisk at present and the advance in rates has materially helped business in loans. The principal banks yesterday had plenty of applications for time money on a 4% basis for sixty and ninety days, which is a material improvement over rates lately ruling. Money brokers report a fair business these times, and there is no doubt that a good many people have provided themselves with time money, who two weeks ago did not appear to want any. The call money market is firm on a 3% basis at most of the banks. Borrowers quite generally have reconciled themselves to paying the higher rate and will probably prove equally docile when the rate is advanced to 4%, as many expect will be the case before very long."

New York Silver Prices.

NEW YORK, Sept. 30.—Following are the closing prices for the week:

	Silver in London.	Silver in N. Y.
Friday	26⅛	57
Saturday	26⅜	56¼
Monday	26⅛	56
Tuesday	25⅛	55

London Merchants	$4.83¾
London Sight Bankers	$4.85¾
Refined Silver, per oz., 1000 fine	54¼
Mexican Dollars nominal	45@46

SILVER.—The market sold lower the past week, but towards the close it strengthened slightly. It is stated that when the price went to 59½ last week it was done by short sellers covering their September contracts, and as soon as they were supplied prices shaded off. It is quite impossible to get at the true situation of the market the East and abroad, owing to so many conflicting reports put afloat. There is no question, though, that in England, Germany and France, in the manufacturing districts, the sentiment in favor of silver is growing, which, combined with farmers, is having a strong influence with the rulers in those three countries.

The best factor in the American political-financial situation, says an Eastern authority, is not the settlement of the tariff or the rise in wheat, but the fact that the silver problem has passed to the other side of the water, to become a question of continental and English-India politics and finance. We have very good authority for saying that this silver problem is troubling Lord Salisbury and his Government very much more than is generally supposed. The uprising in India is entirely in the wheat sections, and there is only one standard for bread in India and that is silver. The natives until recently have known no difference between the coined rupee and the silver bracelet when it comes to money worth or intrinsic value. The people of India have been accustomed in times of need to make coin of their silver reserves whether they were in the form of bullion or of ornaments. When silver ornaments were purchased they were weighed in the scales with rupees for balance, and the difference between their weight in rupees and the asking price was the measure of the workmanship. Now the rupee being no longer coined, has money value exceeding the intrinsic value of silver and the people in distress who find wheat selling at unheard-of prices, measured at their silver standard, are unable to go to the government with silver and return with coin. Of course the absence of rain, the two successive crop failures, the price of bread and the failure of silver to have its rupee value are all placed at the door of the foreign rulers and when it comes to instructing 300,000,000 of India men in the beauties of gold pounds, silver shillings and copper pence and their theoretic fiat and intrinsic relations, American problems become comparatively insignificant to them. It was a straight out issue here as to whether America would defend bimetallism for the whole world by throwing 70,000,000 of producing Americans upon the India side of the question, but the British Empire embraces the gold standard of the East and the silver standard of the Orient, and the question must be ever with her until it is finally settled. When the crops fail in Europe, Americans can afford to laugh over trade discussions, and if the English and continental governments will settle the silver question before the silver countries come again to the front with wheat for export, American politics and American finance will have absolutely unclouded skies.

MEXICAN DOLLARS.—The market is quiet and is expected to continue so until toward the time for the sailing of the next steamer for China. Shippers in that country do not appear disposed to anticipate their wants even on a drop in prices.

COPPER.—The market has held to fairly firm prices throughout the week. The East reports an improved demand for both home and export. The consumption abroad does not show any signs of abating, but from all information at home, it seems to be steadily increasing.

Our market is quoted as follows:

Ingot casting, jobbing	13 @—
Ingot " wholesale	12½@—
Sheet copper	— @16½
Bolt	¼ and 5-16, 20c; ⅜ and larger, 16½

QUICKSILVER.—The market is steady, with a light demand reported.

Our market is quoted at $38 for domestic consumption.

LEAD.—The market is strong at unchanged quotations. The East reports a fair demand at full figures.

Our market is quoted in jobbing lots as follows per 100 pounds:

Pig	5 00	@	5 25
Sheet	6 25	@	6 50
Pipe	5 50	@	6 00

TIN.—The market for pig is easy and for plate it is irregularly weak. The East reports cutting in prices, with the demand light.

The market is quoted in jobbing lots as follows:

Pig, per lb., jobbing	—@ 15
Plate, I C coke, heavy, per box	$4 10@4 25
" " light, "	4 00@—

SHOT.—The demand is increasing. The market is steady.

Our market is quoted as follows:

Drop, sizes smaller than B, per bag of 25 lbs		$1 40
Drop, B and larger sizes,	"	1 65
Buck, Balls and Chilled, do,	"	1 65

POWDER.—An explosion at the California Powder Co.'s plant at Santa Cruz will cut off for a short time one source of supply. The demand is active for mining purposes.

The market is quoted as follows for Hercules: No. 1, from 11¾c to 17¼c, according to strength and quantity; No. 2, from 9c to 11c, according to strength and quantity.

COAL.—The demand continues to show a steady increase for all grades. Foreign are stiff.

IRON.—For the season the consumption is large. The markets at the East are reported fairly active, with more furnaces going into blast.

ANTIMONY.—The market is steady.

Our market is quoted at 8¼c in a jobbing way. New York mail advices quote 8c for Cookson's, 7¼c for Hallett's and 7c for Japanese.

BORAX.—The market is steady.

The market is quoted as follows:

Refined, in carload lots, in barrels	5
Refined, in carload lots in sacks	4¾
Powdered, in car lots	5
Concentrated, "	4½

PLATINUM.—The market is steady.

Our market is quoted in a jobbing way at $15 per ounce and for scrap $10 an ounce.

ZINC.—The market is firm.

Our market is quoted at 10 to 15 cents, according to thickness.

ALUMINUM.—The market is steady.

We quote in jobbing lots at 45 to 50 cents per pound for ingots.

NAILS.—The market is firm with tendency upwards.

Wire, carloads, basis per keg			
" jobbing,	"	"	$2 45
Cut, carloads,	"	"	
" jobbing,	"	"	2 35

Chemicals.

There is absolutely nothing new to report. The expected advances do not materialize and seem to be as remote as ever. A similar condition prevails at the East, as the following mail advices from New York show: "A quiet market for nearly all lines of chemicals is still to be reported. New features are conspicuous by their absence, and prices remain almost stationary throughout."

SULPHURIC ACID.—The demand is fair.

We quote in a jobbing way at 1½c per lb for 66%.

ACETIC ACID.—The market is steady at 6 to 12c per pound from store for carboys, according to make.

NITRIC ACID.—Our market is reported firm from store at 6½@7c per pound in carboys.

BLUE VITRIOL.—Our market is easier.

We quote in a jobbing way at 4c per pound.

SPELTER.—The market is steady.

We quote our market in a jobbing way at 5 cents a pound.

BISMUTH.—The market is steady.

Our market is quoted in a jobbing way at $1.40 a pound.

BONEASH.—The demand is fair.

Our market is quoted in a jobbing way as follows: Extra, 4c a pound; No. 1, 3½c; No. 2, 2½c.

PHOSPHORUS.—The market is firm.

We quote in a jobbing way at 70 to 75 cents per pound.

SODA ASH, 58% (LeBlanc process).—The market is firm at $1.55 per 100 lbs. in a jobbing way.

CAUSTIC SODA, 60%.—The market is steady at 3c per pound in a jobbing way.

HYPOSULPHATE OF SODA.—The market is quiet at 2½c a pound from stores.

NITRATE OF SODA.—The market is steady.

Our market is quoted from store at 4c for 95%.

Mining Share Market.

SAN FRANCISCO, Sept. 30, 1897.

The market went to still lower figures on Friday and Saturday. The decline caused outsiders to sell and it also cleaned up all the weak-margined shares. Monday it opened weak until Crown Point was reached, which, under buying orders, strengthened some, causing a steadier feeling along the entire line, but particularly in the Gold Hill group of shares. Before the day passed Crown Point doubled from Saturday's figures. The street and brokers, as a rule, were puzzled over the advance, which was brought about largely through cross orders, owing to a strike in the west workings of that mine. The rapid advance brought in sellers for a profit, which brought about a decline of about 15 per cent, but this was soon regained, and yesterday it sold up to 70 cents, with Belcher scoring an advance up to 67 cents. The upmove in these two shares strengthened the entire list. It is stated that the ore struck in Crown Point is over 2 feet wide and high-grade. It is about 40 feet from the Belcher line. It is stated that it will be found better in Belcher, which, no doubt, is the cause for the advance in it. Air connection with the 800-foot level is to be made for better working. There is no denying that at several points on the Comstock the work that is under way is of an interesting and important character, and, as shares are said to be well in hand, it ought not to cause surprise if ore strikes are reported for fully thirty days or longer to come. Whilst affirming this, the writer still maintains the belief that no large body will be uncovered, or even enough to make a good-sized deal, although they are liable to go considerably higher than they closed at yesterday. This will be done by outside buying, for the public are ripe for a mining share deal, and the pools or manipulators will gratify them, to some extent, at any rate. Considerable interest is developing in the milling of low grade ore by the Gould & Curry management. It is to be hoped that it will be so far successful as to cause attention to be given by other companies to extracting and milling this grade of ore.

From the Comstock mines the official letters filed indicate continued activity in nearly all the mines, with the outlook said to be quite encouraging. But this is always the case after the public have been made to disgorge nearly all their shares. In Con. Virginia no ore was extracted the past week, but active exploiting work is being done on the 1550-foot, 1650-foot and 1750-foot levels. Nothing of an important character was developed. In Ophir they are still going west on the 1000-foot level. They struck 50-cent quartz, which is about double the assessment that will be struck before long. On the central tunnel a west crossdrift has been started from the end of the south drift. Work in Mexican is still continued on the 1000-foot level. In Utah they are still running west. Considerable interest is centered in the work in the Layton tunnel in Sierra Nevada. It is understood that before long they will commence sinking on the ore found to the east. On the 900-foot level a west crossdrift has been started. On the 900-foot level in Union they have started an east crossdrift from the south drift. They are still drifting north on the 175-foot level in Andes. The joint work by Best & Belcher and Gould & Curry on the 800-foot Bonner shaft level has been discontinued. In Gould & Curry they are cleaning out the 400-foot level to reach the old fillings so as to extract 1000 tons of ore. The work in Savage is the same as has been heretofore reported. No work in Hale & Norcross. No change is reported in the work in either Chollar or Potosi. They are still exploiting in Alpha on the 500-foot level. They are still pegging away in the west crossdrift run jointly by Challenge, Confidence and Con. Imperial. The formation is said to be favorable. They have to run about 180 feet before striking the ledge. Nothing new is reported from Challenge or Confidence. It is reported that they are getting ready to commence work on the 1100-foot level of Yellow Jacket. Work in Kentucky to the west is continued jointly by Yellow Jacket, Crown Point and Belcher. In Crown Point they struck near the Belcher line ore which averages about $100, 3 feet wide—one foot of which goes over $200. Considerable work will have to be done before they can get to the ore, advantageously. In the shuffle they may lose it for a long time to come. In Belcher they are taking out ore and doing some prospecting work. The same remarks apply to Overman and. Seg. Belcher. Good progress is being made in Justice. The ore, as yet, is low grade.

From the Brunswick lode our advices state that in Occidental the crossdrift No. 2 shows an improvement over No. 1 and it is quite confidently expected that No. 3, which will start in about eight or ten days, will show quite an improvement over No. 2. Persons interested in this mine are quite hopeful that a big body of ore will be uncovered. In Chollar they are drifting south on the 500-foot level and expect to reach the Potosi line within the next five weeks. They will probably run a crossdrift after the line has been passed a sufficient distance to admit of it. The work in Savage is practically unchanged. They will soon be in a position to exploit the 300-foot level of Gould & Curry. The other work is reported the same as last week. The market opened strong this morning with another advance in Crown Point and Belcher. The other Gold Hill shares sympathized slightly outside of Kentuck, which hung heavily. It is stated that exploiting work has been resumed in Crown Point to find the extent of the ore. It is also reported that the Belcher management is cleaning out an old upraise from its 900-foot level so as to run for the ore

HEALD'S

BUSINESS COLLEGE.

24 Post Street, - - - San Francisco.

Has opened a Department of Civil and Mining Engineering, Chemistry, Metallurgy, Navigation, Mill Construction, Assaying, Blow-Pipe Analysis, Geology, Trigonometry, Geometry, etc., under the direction of Prof. O. H. Packer, an engineer of national reputation. Full information furnished on application.

The College has also Departments for Bookkeeping and Business Practice, Shorthand and Typing, Penmanship, Modern Languages, English Branches, Telegraphy, and Electrical Engineering.

Students can enter at any time. Pupils receive individual instruction. Twenty teachers. Moderate charges. Write for Catalogue and Journal.

CALIFORNIA STUMP PULLER.

The Most Powerful Made!
Send for Illustrated Catalogue.
A. BARNES, Mgr, 82-84 Zoe St., San Francisco.

in that mine. To judge street reports, it looks as if several of the companies will cause more active work in their mines. Transactions throughout the day were quite large, with cross orders still in evidence as if to sustain prices. At the 2:30 session Crown Point, Belcher and Yellow Jacket sold a few cents higher than they did in the Pacific 2 o'clock informal session.

The following illustrates the changes of the week:

Under date of Salt Lake City, September 24, 1897. J. A. Pollock writes:

The mining stock market this week was more active than for some time past. Fluctuations were very wide at times, and the prices of silver stocks were governed almost entirely by the quotations made on silver bullion. The early part of the week recorded some strong advances, but to-day the market eased off, with every evidence of general heaviness. The gold stocks were in strong demand and transactions were very large in volume. All of the gold stocks look like excellent purchases at present quotations.

No special change occurred in Ajax. The company is operating but lightly as yet at the mines, although some nice ore shipments have come into the market. Anchor continues regular operations and the stock remains listless. It now looks very much as though the Bullion-Beck will resume dividend payments in October, as the treasury holds a nice balance and the company is doing well again. The payment will hardly be over 20 cents when it does come. Increased inquiry made better prices on the stock. No particular change occurred in Buckeye. Light ore shipments are being made, and development work continues.

Without any special activity, Centennial-Eureka continued strong, with few sellers in the market. The properties are reported to be looking very well. Some considerable activity was displayed by Chloride Point, but prices were about unchanged. The Dalys were slightly stronger. Dexter continues to send in some very high-grade gold ore and the stock is receiving good support, with prices changing but slightly. Dalton and Dalton & Lark were inactive and stationary. Eagle is doing some development work. The stock was quiet and unchanged. Four Aces was slightly stronger, as the result of more inquiry.

Geyser-Marion has declared its September dividend of 3 cents per share, payable on the usual date. The contemplated changes in the directory have also been made, being completed yesterday afternoon. President Dern of the Mercur company will be president of the Geyser-Marion, having just secured a large interest, and Treasurer Dern of the Mercur company will be director and secretary. Stuart Stephensen, a prominent operator, will be the other new director. This removes entirely the old Marion interest and gives the company a conservative and able management. Three of the Mercur directors, the Messrs. Dern and secretary Airis, are now on the Geyser-Marion board. Some fluctuations occured in the stock, but the management had a very strengthening effect. I look for much better and firmer prices on the stock, and it certainly merits them. Galena was somewhat stronger, while Grand Central remained unchanged, with business light. Horn Silver did nothing on the market.

Offerings of Mercur were not heavy, and prices did not change materially. The properties are looking extremely well and are making a fine record. Mammoth was considerably stronger again. At the mine the ore showing is very gratifying, and some high-grade gold quartz is being taken out. Better prices governed on Northern Light, the support for the stock being fairly heavy. No changes have occurred at the mines, except for the better. Ontario was in fair demand and made somewhat higher figures. Omaha will be in the courts again this week.

Both of the Swanseas were again stronger, on dividend anticipations and reports of better conditions. At the close a slight reaction occurred. Swansea may pay a dividend on October 1st. Increased inquiry made stronger quotations on Silver King, which is always a strong stock, although seldom active. Sacramento was hardly as strong as during last week. No change occured in Sunshine. All preparations have been made for resuming operations, but the word has not yet been given. Sunbeam was inactive. Utah is looking well and making good ore shipments.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey, Strong & Co., Pioneer Patent Solicitors for Pacific Coast.

FOR THE WEEK ENDING SEPTEMBER 21, 1897.

590,290.—DOOR OPENER—D. B. Akard, S. F.

590,291.—AMALGAMATOR—A. Allen, Milton, Or.

590,354.—FRUIT EVAPORATOR—W. K. Allen, Newberg, Or.

590,382.—SPRING MATTRESS—I. Allen, Lakeport, Cal.

590,398.—SUSPENDERS—J. J. Burke, S. F.

590,411.—SHOTGUN—H. A. Darms, Napa, Cal.

590,391.—RAIL CLIMBER—C. C Durfee, Los Angeles, Cal.

590,502.—SUBMARINE PLOW—C. B. Emerson, S. F.

590,309.—BOTTLE—H. P. Frear, S. F.

590,524.—EXTRACTING METALS FROM SAND—C. A. Hitchcock, S. F.

590,418.—DOOR INDICATOR—E. A. Langford, Washington, Cal.

590,335.—STEP LADDER—W. Price, National City, Cal.

590,423.—CEMENT GRAVEL MILL—J. M. Rademaker, S. F.

590,279.—LOG RAFT—H. B. Robertson, Alameda, Cal.

590,280.—EAR AND TOOTH PICK—F. E. Rockstroh, S. F.

590,281.—VALVE—J. N. Rundle, Santa Barbara, Cal.

590,442.—SEAMLESS TOOTH CROWNS—L. S. Skiff, Salem, Or.

590,531.—FRACTURE APPARATUS—T. W. Sloan, Seattle, Wash.

27,666.—DESIGN BED LOUNGE FRAME—L. G. Beloud, S. F.

NOTE.—Plain and Certified Copies of U. S. and Foreign patents obtained by Dewey, Strong & Co., by mail or telegraphic order. American and Foreign patents secured, and general patent business transacted with perfect security, at reasonable rates, and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

DOOR INDICATOR.—Ernest A. Langford, Washington, Cal. No. 590,418. Dated Sept. 21, 1887. This invention relates to a device which I call an automatic doorplate indicator. It is especially designed for attachment to doors of rooms or other places, to indicate whether the same are occupied or unoccupied, and is designed to be moved so as to indicate the condition of the room by the action of the doorknob and an intermediate mechanism between the lock and the indicator. The indicator may be made of any suitable shape, preferably cylindrical or segmental, and fits into an opening which is exposed upon the outside of the door. Connections are made with the doorknob in such a manner that, when the outer knob is turned, the door can be opened without affecting the indicator, and it can also be closed from the outside without altering its position. If the occupant leaves the room, in turning the inner knob, the mechanism is so actuated as to turn the indicator plate and show that the room is unoccupied.

RIFLE ATTACHMENT FOR SHOT GUNS.—Herman A. Darms, Napa, Cal. No. 590,411. Dated Sept. 21, 1897. The object of this invention is to provide an attachment which may be used in conjunction with ordinary shot guns, so that by introducing it into the rear of the barrel it provides a short rifle barrel which is adapted to receive the rifle cartridge so that a ball may be used where game is discovered larger than a shot gun would be efficient with. This barrel is accurately centered within the shot gun barrel so that the bullet will fly straight through the latter, and the rear end is so fitted to the rear of the shot gun barrel that it will not interfere with the operation of the extracter mechanism, and this can be employed to extract rifle shell as well as that of the shot gun. Whenever the shot gun is to be used, the short rifle barrel can be again removed and carried about the person without difficulty.

DEVICE FOR FORMING SEAMLESS TOOTH CROWNS.—L. S. Skiff, Salem, Oregon, assignor to Joseph F. Twist, San Francisco. No. 590,442 Dated Sept. 21, 1897. This invention relates to a device which is specially adapted for the formation of seamless tooth crowns. It consists of an apparatus by which the disks of metal are by successive operations brought to the proper size and cup-shaped, a means by which the cups are formed upon each tooth crown, corresponding with those of the tooth where the crown is to be applied. This is effected by means of a die formed in the line of the grain and plane of the meeting faces of two united wooden blocks, the bottom of the die being pressed into exact conformity with the fac-simile of the tooth at the end of the mandrel so that the cup-shaped crown can be introduced into the die thus formed and afterwards shaped by the use of the mandrel and the wooden bottom of the die.

CEMENT GRAVEL MILL AND CRUSHER.—J. M. Rademaker, San Francisco, Cal. No. 590,423. Dated Sept. 21, 1897. This invention relates to an apparatus which is especially designed for the disintegration and separation of what is known as cement gravel or packed material which is in the nature of a conglomerate containing some gold-bearing gravel and a larger amount of rocks or cobbles to which the gravel is adherent and from which it is desired to separate the latter instead of crushing the whole mass including the cobbles. It consists essentially of parallel spaced barrels arranged cylindrically having their ends fitting in radial grooves or channels in heads situated at opposite ends of the cylinder, wedge plates by which the distance between the barrels is retained intermediate between the heads, bands by which the plates and barrels are removably secured in place; a eed opening at one end of the cylinder; openings made around the opposite end adapted to discharge the uncrushed cobbles, bearing rollers upon which the cylinder is rotatable; a trough or scraper enclosing the lower part of the cylinder adapted to receive the material which passes through the bars, hammers hinged spirally upon opposite sides within the cylinder so as to fall by gravitation and automatically act to crush the material as it passes through the cylinder. Suitable water-conducting pipes are arranged to discharge sprays of water and the loosened material is conducted to a proper place for further treatment.

QUICKSILVER!
—FOR SALE BY—
The Eureka Company,
OF SAN FRANCISCO.
ROOM 1, - 426 CALIFORNIA STREET,
SAN FRANCISCO.

Assessment Notices.

SAVAGE MINING COMPANY.—LOCATION OF principal place of business, San Francisco, California; location of works, Virginia Mining District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees, held on the 2nd day of September, 1897, an assessment (No. 35), of 20 cents per share, was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the Secretary, at the office of the company, No. 309 Montgomery street, Room 50, Nevada Block, San Francisco California.

Any stock upon which this assessment shall remain unpaid on the 5th day of October, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of October, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

E. B. HOLMES, Secretary.

Office—No. 309 Montgomery street, Room 50, Nevada Block, San Francisco, California.

ANDES SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Virginia City, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 1st day of September, 1897, an assessment (No. 44) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, rooms 20-22 Nevada block, 309 Montgomery street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 4th day of October, 1897, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 25th day of October, 1897, at 1 o'clock P. M., to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

JOHN W. TWIGGS, Secretary.

Office—Rooms 20-22, Nevada block, 309 Montgomery street, San Francisco, California.

FAIRFAX VILLA COMPANY.—Location of principal place of business, San Francisco, California; location of works, Fairfax, Marin County, California.

Notice is hereby given that at a meeting of the Board of Directors held on the 10th day of September, 1897, an assessment (No. 7) of Fifty Dollars per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary, at the office of the company, room 56, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 18th day of October, 1897, will be delinquent, and advertised for sale at public auction, and, unless payment is made before, will be sold on MONDAY, the 8th day of November, 1897, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

By order of the Board of Directors.

J. STADTFELD, JR., Secretary.

Office—Room 56, No. 309 Montgomery street, San Francisco, California.

ALTA SILVER MINING COMPANY.—Location of principal place of business, San Francisco, California; location of works, Gold Hill, Storey County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the 3d day of September, 1897, an assessment (No. 57) of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to to Secretary, at the office of the company, room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 6th day of October, 1897, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 27th day of October, 1897, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Director.

J. E. JACOBUS, Secretary.

Office—Room 33, Nevada block, No. 309 Montgomery street, San Francisco, California.

THE CALIFORNIA DEBRIS COMMISSION, having received applications to mine by the hydraulic process from Horace Taber, in the Taber Gold Mining Claim near Gibsonville, Sierra Co., to deposit tailings in Gibson Creek; from Fred Smith, in the Black Oak Mine near Yankee Jim's, Placer Co., to deposit tailings in Owl Creek; from W. H. Leek et als., in the Miocene Mine near Crescent Mills, Plumas Co., to deposit tailings in Rush Creek; from Henry Conbrough, in the Ellrig Mine near Carbondale, Amador Co., to deposit tailings; and a flat; from John C. Murphy, in the Slate Creek Placer Mine near Kelsey, El Dorado Co., to deposit tailings in Dutch Creek; from John M. Jackson, in the Jamison Placer Mine near Johnsville, Plumas Co., to deposit tailings on a flat; from Sook Hung Lung, in the Barnard's Diggings near La Porte, Plumas Co., to deposit tailings in Slate Creek; and from the Jupiter Gravel Mining & Water Co., in the Jupiter Gravel Mine near Dogtown, Calaveras Co., to deposit tailings in San Domingo Creek, gives notice that a meeting will be held at room 59, Flood Building, San Francisco, Cal., on October 11, 1897, at 1:30 P. M.

Assaying Gold
AND
Silver Ores.

This work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes whereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the pratical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores,") that have been "successfully popular," is written in a condensed form, which renders his information more readily available than that of more wordy writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

Table of Contents:—Perface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of cupellation; Weighing of Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests of Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 126 12-mo pages, with illustrations, well bound in cloth; 1896. Price $1.00 postpaid. Sold by the Mining and Scientific Press, 330 Market St., San Francisco.

DELINQUENT SALE NOTICE.

GOLD RIDGE CONSOLIDATED MINING AND Milling Company.—Location of principal place of business, San Francisco, California; location of works, Nevada and Sierra Counties, California.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 5) levied on the 3rd day of August, 1897, the several amounts set opposite the names of the respective shareholders, as follows:

Name.	No. Cert.	No. Shares.	Amt.
John A. Heninger	16	250	10 00
Nils Johnson	120	100	4 00

And in accordance with law, and an order from the Board of Directors, made on the 3rd day of August, 1897, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, Rooms 12 and 13, No. 43 Sixth St., San Francisco, California, on SATURDAY, the 9th day of October, 1897, at the hour of 12 o'clock M. of said day, to pay said Delinquent Assessment thereon, together with costs of advertising and expenses of sale.

H. SYLVESTER, Secretary.

Office—Rooms 12 and 13, No. 43 Sixth St., San Francisco, California.

PATENTS

DEWEY, STRONG & CO'S
PATENT AGENCY.

Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American reports, with full copies of U. S. Patents since 1872. All worthy inventions patented through DEWEY, STRONG & CO.'s Patent Agency will have the benefit of a description in the *Mining and Scientific Press.* We transact every branch of patent business, and obtain patents in all countries which grant protection to inventors. The large majority of U. S. and foreign patents issued to inventors on the Pacific Coast have been obtained through our agency. We can give the best and *most reliable* advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and circulars free.

DEWEY, STRONG & CO.,
PATENT AGENTS,
330 Market Street, San Francisco, Cal.

MICHIGAN COLLEGE OF MINES.
A State technical school. Practical work. Special facilities for men of age and experience. Elective system. 45 weeks a year. Non-resident tuition $150 a year. For Catalogues, address
Dr. M. E. WADSWORTH, President, Houghton, Mich.

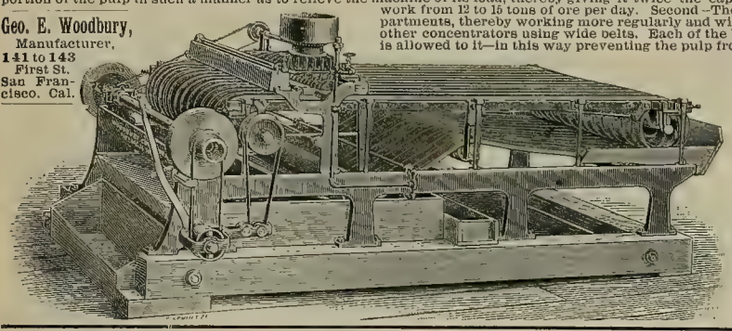
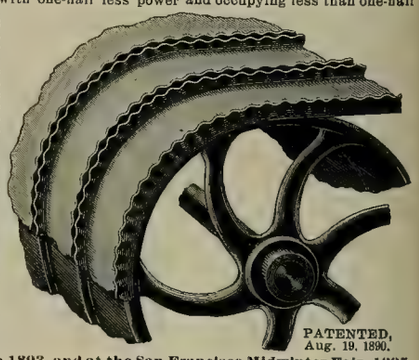
CALIFORNIA WIRE WORKS,

Room 610, 330 MARKET ST., - - - SAN FRANCISCO, CAL.

THE WOODBURY ORE CONCENTRATOR WITH IMPROVED BELTS was awarded the Highest (Bronze Medal) Premium at Mechanics' Institute, 1890 and 1891. MORE THAN DOUBLE THE CAPACITY with one-half less power and occupying less than one-half the space of any other concentrator. Built of best Steel and Wrought Iron. Strong and durable. **Price $575 f. o. b.** Send for Catalogue and Testimonials. The annexed cut shows the belt in its improved form, which consists of corrugated edges, to form an expanding top edge. THE IMPROVED MACHINE HAS THE FOLLOWING MERITS: First—The Improved belts, which consist of seven, are constructed and arranged so as to allow each belt to receive a portion of the pulp in such a manner as to relieve the machine of its load, thereby giving it twice the capacity of other concentrators, and enabling it to work from 12 to 15 tons of ore per day. Second—The machine equalizes the load by several compartments, thereby working more regularly and with much less attention than is necessary to give other concentrators using wide belts. Each of the belts on this machine takes care of the pulp that is allowed to it—in this way preventing the pulp from running to the lower side of it, as is the case when a machine becomes out of level where wide belts are used. Third—The belts run on a perfect line, needing no adjustment to prevent their running from side to side, as in other concentrators. Fourth—The belt surfaces are improved by indentations and corrugations, causing the Concentrator to save fine sulphurets and quicksilver, and perform close work. Fifth—The belts have fluted or corrugated edges, to form an expanded top edge, which effectually prevents from cracking. Sixth—The feed arrangement is perfect. Seventh—The machine is constructed of iron, with steel crank-shaft self-oiling boxes, and everything made in the most thorough manner, enabling it to run with very little attention or wear.

Geo. E. Woodbury, Manufacturer, 141 to 143 First St. San Francisco. Cal.





PATENTED, Aug. 19, 1890.

This Concentrator took the 1st prize at the San Francisco Mechanics' Institute in 1890, 1891 and 1892, and at the California State Fair in 1892; it took the 1st prize at the World's Columbian Exposition 1893, and at the San Francisco Midwinter Fair, 1895.

Of Doubtful Value.

Chicago has already evolved a "dry washer" for use in the Klondike. G. T. Glover of that city has a plan "endorsed by Sec'y Alger at a Cabinet meeting," to get supplies into Dawson City this winter by use of a "snow locomotive," found to be of some value in Sec'y Alger's logging camps in Michigan. "The locomotive is very simple in construction. There is a steel frame of two tons resting upon the runners, fore and aft. This frame sustains a boiler and engine and other machinery necessary. A large cylinder wheel with teeth arranged about it at intervals is the means of getting traction on snow and ice. This wheel is propelled by steam. The hot air that is lost generally is utilized in the operation of the locomotive. Wood is used as fuel."

Mr. Glover and Sec'y Alger are reported to be confident that in this scheme they have a satisfactory solution of the problem of succoring starving Klondike miners, and propose to put some of those concerns on "between Dyea and Dawson" under Government auspices. The idea is too ridiculous to warrant serious consideration.

Recently Declared Mining Dividends; Recent California Mining Incorporations, 355.

Assessing Mining Property.

Among the many other important subjects which might to advantage engage the attention of the coming meeting of the California State Miners' Association is that of providing by law for a more satisfactory and equitable system of assessing mining property in this State and every other mining State in the Union. The present system is admitted to be unbusinesslike and often unjust, and in the majority of cases is simply a random guess at the value of the property, made by a man who knows little of such values. Mining men seldom accept county offices and the assessor is usually a small merchant, a mechanic, clerk or professional officeholder. Rarely indeed does he go into a mine; more rare are the cases where he would know any more of its value if he did go. The result is that after standing on the dump and looking around he fixes on a lump sum based on the reported values of other properties in the vicinity. The reputed values on which such estimates are bound to be based are always far in excess of the actual selling values of the properties, and the only appeal from the assessment is to the board of equalization, whose decision differs in value from that of the assessor only in being the average of about five guesses by as many men of qualifications similar to those of the assessor. Not long ago a leading mining expert of this State, who had previously examined (and condemned) the property under consideration, was called as a witness before a board of equalization in a northern California county. The assessor (a butcher) had returned an unworked mining claim at $80,000. The owner, divided between fear of an exorbitant tax on the one hand and of depreciating a property he wanted to sell upon the other, asked for a reduction to $50,000. The board (a better than average board, too) was composed of intelligent farmers who could judge the yield of wheat per acre to a nicety, or come close to the weight of a hog, but knew as little of mining as of tea culture. What they finally decided the expert mentioned never heard, but the remark of one of their number is well remembered. Said he: "The owner can't afford to work that property, and won't sell it." Opinion as to the merit of such a policy is likely to be affected by the point from which it is viewed. The owner of unproductive mining property which he can't sell and is unable to develop has a hard enough time without having the property confiscated in the name of the law. Any fair system of taxation of mines should take into consideration the present ability of the property to pay such taxes—that is to say, its productiveness or otherwise—and the only true criterion of the value of a mine is its capacity for producing at a profit. We already recognize this principle in assessing all other real estate where a reduction is made in valuing unproductive property. Upon this idea have grown the laws of several of the mining States, which recognize three factors in arriving at the taxable value of mines: First—The land proper, generally based on a fixed price per acre, which is usually the Government price. Second—The value of buildings, machinery, etc., valued as are similar improvements in other industries. Third—The producing value of the mine, as measured by its net annual proceeds. Thus, as an instance, the great Anaconda mine in Montana is carried on the roll of the assessor at $105, while the improvements of the company are assessed in the millions, and to this is also to be added for taxation the profits of the past year, just returned as something over $5,000,000. Some such system, modified if need be to suit local conditions, would seem to be more satisfactory than the present random system, which is irrational in the extreme. Nowhere but in the conduct of public business would we intrust the valuation of properties to men admittedly without qualifications or facilities for the duty. The proposed change would place the burden of taxation on those best able to bear it and relieve such property as can barely pay expenses from a share of the load. This is not in the line of charity, but of business, for an operating mine is a large factor in the prosperity of the community where it is situated, and that prosperity is largely independent of the size of the dividends to stockholders. In the low grade ore districts of the Mother Lode belt a tax of 2% or 3% on the valuation, often exaggerated, of the property often means the difference between financial success and failure, between operating and shutting down, and, apart from the effect on the community, any loss from this source to the public treasury is more than made up by the enhanced value of surrounding property.

Another anomaly in our present mine-taxing system is that of assessing unpatented mining claims. The plain law of the case, that until patented the title rests in the general government and the land is not liable to taxation, is set aside by the legal quibble that we do not tax the mine itself but only the locator's possessory interest therein, and this possessory interest is declared to be real estate. In practice the assessor never tries to value these claims at all. He usually copies from the record a list of locations and fixes a uniform and arbitrary value on the whole lot. He does not go to see them; probably he could not find half of them on the ground if he tried to do so. Right here the "possessory interest" farce ends. If the tax is not paid (at least in every case that has come to the writer's notice), there is advertised for sale, sold and later deeded to the State not the locator's possessory interest in the A. B. C. claim but the A. B. C. claim itself. Now if the State derived any benefit from these tax sales it would be a more rational proceeding, but there is nothing in our Constitution that authorizes the State of California to go mining, and while the tax sale may ultimately deprive the prospector of his claim, the State gains nothing. The commonwealth can not do the assessment work necessary to hold the claim and in fact its title is extinct for failure to represent long before the tax deed can pass to it. Nor can the State proceed for patent even in those cases where the work done is sufficient to warrant it. The prospector is merely mulcted out of two or three dollars a year, if he refuses to pay; the State takes his property away from him, and being unable to hold it, at the end of a year restores it to the public domain. The patient prospector waits therefor and at the proper time relocates the mine under another name and the county is out the cost of advertising and selling, and the farce begins again. If the public treasury needs a few dollars a year from each claim located why not get it with dignity either from an increased recording fee or from a prospector's license similar to the Canadian system; or if claims are still to be sold to the State then by legislative appropriation they should be worked up to the sum of $500 say by our unemployed, then patented and sold on public account as opportunity offers. This may be paternalism but it is better than petty larceny. The subject is a practical one and is commended to the attention of the coming Miners' Convention.

State Mining Bureau Work.

At the last session of the California Legislature the State Mining Bureau received the usual appropriations for carrying on its work, the usual requirement being enacted that a certain proportion—in this case at least 50 per cent—be expended in field work. Last March a number of assistants in field work were authorized sent out by the newly appointed State Mineralogist to continue that work on much the same lines as had been found by past experience to be advantageous and of practical value. The policy, however, of the new administration did not seem to be in accordance with such requirements, and one by one, with the exception of Mr. Watts, these skilled assistants have been called in and discharged, in general with the work in an incomplete condition. The dropping of this work is said to have been caused by the fact that the policy of the present chief State executive officer would not permit the printing of the reports until after the next session of the Legislature, which condition would have been somewhat embarrassing were it not for the fact that the offer was made from a responsible source to publish all the reports free of cost. The State Mineralogist, however, saw fit to refuse to have prepared the results of the field work done to the present time; nor would he permit the material to be printed. His right to do this is unquestioned, though it seems a matter of regret that the good which might have been derived from the several thousand dollars already spent, and which would have been of great advantage to miners all over the State, is thus rendered inoperative.

The plans of the State Mineralogist, as they have been given out, seem to contemplate the virtual abandonment of all field work for nearly two years. Just how such arbitrary action will affect the provisions of the act under which these appropriations were obtained is, at present, an undetermined question. In thus discarding all experience of this institution, as well as that of others of a similar character, and outlining a plan which does not seem to receive the approval of practical miners in the State, the present official takes a wide departure—one which it is hoped will result more favorably to the best interests of the mining industry of this State than the present condition of affairs would seem to warrant in expecting.

The "topographical maps," which it is the intention of the mineralogist to issue, are believed to be very pretty, and would doubtless add much to the appearance of an office where properly displayed. One is to be compiled for each county in the State, using as a basis the county maps already existing, where possible. It is believed that no original surveys of any extent are in contemplation, though a fee of $100 to each county surveyor is a part of the plan; and in this regard it is also to be hoped that the old errors and methods of a generation ago are not to be perpetuated. Upon these maps, by means of an ingenious system of symbols, it is the intention to indicate the location of mining claims and different mineral deposits; and it is believed to be also the plan to use the maps as a basis of mapping the geology of the State. These maps, when so prepared, it is expected, will be sold or disposed of in some way to the county supervisors.

Without discussing the sense or business judgment of such a proposition, it is believed to be in order to state that, in the first place, county supervisors are aware that at the present day the only kind of topographical map having any value is that upon which the elevations are indicated by contour lines; and State and Federal authorities are unanimous in the assertion that such a map is the only kind of one on which it is of any practical use to attempt to portray the geological features. The accurate topographical maps of the United States Geological Survey have already covered a large part of the mineral bearing portions of this State, and are being extended to parts not mineral bearing; so that it would appear useless to reissue incorrect county maps of these areas and expect to use them as a basis for indicating the minerals as well as the geology of the State.

The maps, which it is the intention of the State Mineralogist to issue, are to indicate the desired features in the old-fashioned guess-work way, which is not up-to-date and has been discarded by those

who claim accuracy as a part of their work. To patch up inaccurate maps at considerable cost of time and labor—with all their inaccuracies and absence of contour lines—and expect to use them as the basis for future geological mapping, or to put them out as coming from the State Mining Bureau of California, is apparently not calculated to increase the high regard that is now manifested all over the mining world for the productions of the Mining Bureau of this State.

At considerable expense, as the result of intelligent individual effort, and in pursuance of wisely formulated plans, the work of the State Mining Bureau of California has been put upon a plane equal to that of any other similar institution in the world, and far superior to the most of such organizations. From every quarter of the globe has come to this journal from reputable sources, intelligent criticism, praising in most favorable terms the publications as issued from time to time, citing them as models for their governments and quoting from them at length as standard authority on the subjects of which they treated. Monographs have been reproduced in full in all the leading mining journals of the world; and the issue from the State Printing Office of the number of copies printed has in nearly all cases been unequal to the universal demand, a third edition being in some instances required.

Upon these maps the intended-to-be important data to be placed during the coming two years—to the accomplishment of which all the available funds are presumably to be spent—is the indication by symbols of the mines and mineral deposits. These are to be located from data now in the office, which is believed to be far from complete, and which could not be put into shape without considerable more field work. Under the very best conditions the maps can be looked upon only as a patchwork of inaccuracies, and so incomplete that no county board, properly informed as to the nature of the case, could be induced to view as of sufficient importance to purchase.

Recurring to the disagreeable work of pointing out what seems to be mistaken intent: admitting that the maps are perfect, or approximately correct, the manner of marking the mineral deposits does not accomplish the purpose, which in itself is misleading. The manner of designation can not distinguish the deposits of value from those of mere mineral interest; can not distinguish the valuable mines from a mere prospect; or a long defunct and worked-out property from one being operated to-day. The maps will simply show what everybody knows already—that gold-bearing quartz veins or other minerals are scattered through portions of the State. The maps do not indicate the extent nor the appearance governing their formation, and, it is believed, can be of little practical use.

Apart from California, at the present day the writer knows of no State or Governmental institution in the world which pretends to countenance such superficial methods of making known its resources. California has been liberal with the State Mining Bureau, and the plea cannot be consistently made that the funds are not sufficient, especially when one knows what has been accomplished by other States with smaller appropriations.

It would be a loss, no less to the mining industry of the State than to the prestige of the Bureau itself, were any course taken that would inure to the lowering of the high standard of the work as previously carried on. In speaking of this, more need not be said, less could not be said. So far, this journal has deemed the charity of silence the best comment on the present official course, but it would be untrue to itself and the great industry it represents to pass over what is believed to be the untoward policy of a very worthy gentleman who does not seem to grasp the requirements of his present situation.

Concentrates.

THE Garlock, Cal., Mining Bureau has incorporated.

THE Colorado Springs, Colorado, Stock Exchange has suspended.

LE ROI, B. C., shipments from January 1, 1897, to September 25 footed 41,907 tons.

THE California Debris Commission will act on sundry applications to mine on the 11th inst.

THE local bullion value of the Mexican silver dollar is now 44.6 cents, the lowest in its history.

THE present trustees of the California State Mining Bureau are "hold-overs." The terms expired last May. There are two vacancies in the board. The Governor has the appointing power.

BROWN'S VALLEY, CAL., mines are to be run by electricity. Power is to be transmitted nineteen miles.

THERE is a stampede from Skaguay, and every one who can is getting back toward civilization for the winter.

JACKSON, CAL., mining men think the facts justify the sinking of a 3000-foot shaft between the Zeila and Moore mines.

ON the 4th inst., the Yuba county, Cal., Board of Supervisors appropriated $200 to D. P. Durst "for anti-debris services."

THE Kennett Mining Co, Virginia City, Montana, W. B. Millard manager, will build a 60-stamp mill. Jno. S. Allen is superintendent.

AMONG the minerals produced in New South Wales during 1896, platinum occupies a position for the first time, the output being valued at £3479.

A LONDON mining paper, of date Sept. 18, announces the arrival of a steamer at San Francisco from the Klondike "with gold to the value of £2,500,000."

THE proprietor of a New York City "mining paper" announces that he is so busy getting up Klondike schemes that he has no time to issue his journal, which is suspended.

THE Butte *Inter-Mountain* says, concerning the reports of an Anaconda purchase of the Butte & Boston, "that B. & B. stands for bulls and bears as well as for Butte & Boston."

UTAH'S pumice stone deposits are now supplying over 60 per cent of that article in this country, and with a tariff of $6 per ton the peoned product of foreign rivals is practically shut out.

THE law requires that the surface ground used for residence and business purposes, upon a patented mining claim, must be assessed at a price approximating its value for such use and purpose.

UNDER orders from Washington 1,000,000 silver dollars will until further notice be coined monthly at United States mints, of which amount 300,000 will be monthly coined at the San Francisco mint.

EX-GOVERNOR RICKARDS has raised the amount needed for the completion of the Butte, Montana, school of mines. His list shows a total of $33,800 subscribed, the amount called for by the contract is $32,500.

THE second installment of the price for the Peacock mines, Seven Devils district, Idaho, has been paid; a 325-ton smelter is to be built by March 1st, '98, at Cuprum, and a railway built therefrom to the Snake river.

J. D. VAUGHAN, a mining operator of Denver, declares that the average profit on gold mining in all countries, is from 50 to 80 per cent, while the cost per ounce of silver production on most mines exceeds the market quotations.

THE Southern Pacific Railroad Company is running a survey presumably to connect Jamestown, Cal., with Salt Lake City, via Walker's pass. This route would be 250 miles shorter than that over the Central Pacific Railroad.

THE late Barney Barnato, who committed suicide by throwing himself into the sea from the British steamer Scot on June 4th last, while on the passage from Capetown to Southampton, left a fortune amounting to £963,865 8s 6d.

THE Nevada Co. Miners' Association has this year sent $750 to the California State Miners' Association. The entire expenses of the county association for the year were $27.50, which illustrates how economically those affairs are administered.

A 20 H. P. BOILER exploded last Wednesday at Claraville, forty-five miles west of Garlock, Cal. The boiler was used to run a small stamp mill and was owned by Hamilton & Morris. The dead body of R. Tuskin was picked up about 100 feet from the boiler.

DIRECTORS BICKFORD, CUTLER AND GROSE of Boston attended the annual meeting of the Pioneer Gold Mining Company at Helena, Montana, last Tuesday, and are now visiting their mine in Placer county, California, to obtain surveys and estimates for an addition of twenty stamps and for an electrical plant.

THE official call for the annual convention of the California State Miners' Association is received. The convention will be called to order at 10 A. M., Oct. 18th, '97, at Odd Fellows' Hall, Seventh and Market streets, San Francisco. The secretary requests a full list of delegates and their addresses by the 12th inst.

JOAQUIN MILLER claims that he named Idaho. The facts antagonize the statement. In September, 1860, Geo. B. Walker, among other miners at Pierce City, in what was then Washington Territory, favored territorial division, and he suggested the name "Idaho" for the new territory, which was so named when created, March 3, 1863.

THE Washington, D. C., Treasury Department has again declined to receive a million dollars in gold at San Francisco in exchange for currency at New York. The department will not receive gold at distant points for exchange or transportation on any terms. Officials say the gold is not needed at San Francisco and the Government is not in the express business.

REGARDING the attempted location of a part of the bed of the Los Angeles river, within the Los Angeles city limits for mining purposes, it is probably of interest to note that the State Supreme Court and the Supreme Court of the United States hold and have held since the year this journal was established—1860—that such locations can not be legally maintained.

A $200,000 LAW SUIT has begun in Stockton, Cal. The plaintiff is the Lightner Mining Company, the defendant the Utica Mining Company. Plaintiff and defendant own adjoining mines in Calaveras county; plaintiff claims that defendant unlawfully crossed over the dividing line between the properties entered upon the Lightner mine territory and took ore to the amount of $200,000.

So far this year the California Debris Commission has granted thirty-five permits to conduct hydraulic mining operations on the water shed of the Sacramento and San Joaquin rivers. The total number issued to date since the passage of the Caminetti law is 240. The miners still live in the deferred hope that those restraining dams, for which $500,000 has long been appropriated, will be built.

THE hoisting engine of the Black Warrior Copper Company, near Globe, Arizona, was blown up one morning last week by some unknown miscreant. Giant powder was placed under each of the two cylinders of the engine and exploded a few moments apart, wrecking the engine, blowing the cylinders into fragments, tearing asunder the wooden foundation blocks which were bolted to the stone beneath, and blowing the roof off the building. Supt. White estimates the damage at $2000.

AN item is going the rounds that, beside the Calumet and Hecla, the Con. Cal. & Va., the Ontario and Granite Mountain, there are no other mines with a dividend record of $10,000,000. The Belcher and Crown Point have each exceeded that amount in dividends. The Belcher Mining Company paid $15,397,200 and the Crown Point $11,898,000—both Comstock mines.

REPORTS reaching the Mint Bureau from time to time warrant the estimate that the world's production of gold for 1897 will be between $235,000,000 and $240,000,000, an increase of more than $30,000,000 over the product of 1896. The United States will probably lead all other producing countries with a total of $60,000,000. South Africa and Australasia will be close competitors for second place, with a total production exceeding $50,000,000 each.

NEARLY all the silver mines, says the *Japan Mail*, have stopped work of late owing to the fall in silver. The Innai silver mine, in Ugo Province, which employed about 5000 miners, produced about 350 kuamme of silver per month. The owner of the mine lately fitted up new electrical machinery at a cost of about 300,000 yen, in order to expand the work early in the spring, but now that silver has depreciated so greatly, he also is obliged to stop and discharge all his miners.

AN interesting case has just been decided by the Supreme Court of New Mexico of considerable importance as regards the rights of those who grubstake mining prospectors. Henry Lockhart of Albuquerque had grubstaked the original locators of the Washington mine at Cohiti, which property, when it proved valuable, became the subject of litigation between Lockhart and the locators whom he had grubstaked. It has been in the courts for several years, the result finally being in favor of Lockhart.

AS PROPHESIED in these columns, discoveries of quartz ledges of some value are reported from the Klondike. It is now stated that the North American Trading & Transportation Company will send a stamp mill to Dawson on the first steamer going up next summer. By July it is intended to have it in operation on these ledges. Development of quartz mines is so expensive on the Yukon, pending proof of their richness, that at least only big commercial companies can afford to undertake it.

THE Rossland, B. C., *Miner* asserts that "while the C. P. R. is not going into the smelter business, those who are closely identified with it will do so, and arrangements are practically completed for the erection of large reduction works at some advantageous point on the Columbia river, which will treat Rossland ores. This plan includes a scheme for gathering together ores of the different mines situated on the different mountains around Rossland at one general depot. Every shipping mine will be made tributary to the C. P. R. by lines of aerial tramways from the mines to the railway track, to the total exclusion of other roads."

IN the suit of Simpkins, who claimed riparian rights on Rogue river, Oregon, against James Savage, a miner, who was working a mine in the bed of the river by a wing dam, in the Josephine County Court, Judge Hanna decided last week: That the riparian proprietor owns the ground as far as the center of the stream and is to be protected by the court. The effect of this decision is locally interpreted to be that along the banks of a stream that have passed out of the hands of the Federal Government and become private property, the miner who proposes to mine the banks or bars of that stream must first secure a permit from the contiguous proprietor. If there is no such proprietor, then the bars and banks of the stream are open to location as any other mineral ground.

REGARDING the duties on British Columbia silver-lead ores, the Secretary of the Treasury calls attention to the fact that paragraph 181 of the Dingley law makes no distinction between silver-lead ores and other lead-bearing ores, and imposes a duty of 1½ cents per pound on the lead contained in all lead-bearing ores. "Lead ores are not, therefore, dutiable at the rate of 1½ cents per pound on the gross weight of the ore," says the Secretary, "but, on the contrary, duty should only be assessed at the rate of 1½ cents per pound on the lead actually contained therein as shown per assay. Furthermore, as paragraph 181 makes no distinction between lead ore and silver ore containing lead, it is unnecessary to take into consideration the actual market value of the lead contained in silver ore for the purpose of ascertaining whether the same is a silver ore or a lead ore, as was the practice under the provisions of the Wilson law."

A NATURAL mistake that is altogether too common, says the *Bulletin*, is for a corporation to name a bank as treasurer of its funds. Frequently the bank named is not even consulted in the matter. The appointment is made as a compliment or as a convenience. Sometimes, it is feared, the motive is less praiseworthy. As a matter of law, a bank cannot act as the treasurer of a corporation, because that involves personal liability. Corporations in naming banks as the custodians of funds should designate them as depositaries and not treasurers. The functions of the two agencies are entirely dissimilar. Those of a treasurer are personal, and usually he has no discretion whatever in the handling of funds. The functions of a bank are commercial. It can and does receive the deposits of corporations, the same as from firms or private individuals, subject to check; but it performs none of the acts of a treasurer and should never be designated as the treasurer of a corporation. They simply act as depositaries.

THE cost of producing an ounce of silver is something no one can accurately figure. Too many elements enter into the problem to render it capable of solution. Even the best estimates are tinged with personal prejudices. Thus, Ottomar Haupt estimates that the average cost of production of silver in United States mines is about 46½ cents; that where it involves extraction of silver from lead production costs about 48 cents, and from copper 46 cents, and that the treatment of argentiferous ore costs 34 cents per ounce fine. But it is probable that his estimate is influenced by his hostility to bimetallism. It is claimed that the Broken Hill Proprietary mine in Australia produces silver at a cost of 40 cents per ounce. The lowest cost ever figured by any statistician is that of production by the Bontoux mine in Spain, of 10 cents per ounce. The Austro-Hungarian mines average a cost of 75 cents. Probably were it possible to aggregate in money's worth everything expended in the effort, it would be found that every ounce of silver ever mined in the United States cost over $1 per ounce to produce.

The Cyanide Process.*

NUMBER II.

The high specific resistance, when scientifically utilized, aids in simplifying matters, rather than robbing the method of its cheapness.

The haloid salts of potassium are separated into acid and base, the electromotive force necessary to produce decomposition being much less than that required to set free the alkali metal. (*Jour. Chem. Soc.*, 1882, vol. xlii, pp. 260, 283). This being the case, we cannot well accept the theory that $AuCy_2$ goes to the anode and K to the cathode, or that gold under ordinary circumstances is deposited upon an anode of iron from an $AuKCy_2$ solution. It is rarely the case that gold is ever deposited from a cyanide solution on the anode. It is firmly deposited on the cathode.

As to the existence of the auro-cyanhydric acid, and its assimilation to the ferro-cyanhydric acids, the discussion might be prolonged; but an essential character of the ferro-cyanides is that by adding to them the salt of another metal the iron is not displaced and no cyanide of iron is separated.

This is not the case for double cyanide of gold and potassium and for auro-cyanhydric acid, because: (1) chloride of mercury separates the cyanide of gold (see pages 16 and 17 of Prof. Christy's paper); (2) the silver of the silver nitrate precipitates the gold entirely, making an interchange of metals instead of forming auro-cyanide of silver; and (3) mercury and lead act partially in a similar manner (*ibid.*, page 14, paragraph 4). It matters little about auro-cyanhydric acid, since, if it cuts any figure at all in electrical precipitation, it can be got rid of by using a sufficiently strong current. I am aware that electrical precipitation is not perfect; nevertheless, I think the present practical choice involves, in any case, electrolysis. If we take the zinc preparation of the MacArthur-Forrest process, we have voltaic electrolysis, involving one liquid and one metal, the metal depositing upon itself. This means a fouling of the solution and the resulting bullion. If we take the Kendall process of zinc-amalgam precipitation, we obtain a much purer bullion, but Mr. Kendall himself says it is precipitation by electrolysis, in which case we have the voltaic action of two metals, virtually one, in one liquid. The next alternative is the Siemens-Halske method. This is avowedly electrical, involving one liquid and two plates. It gives a good bullion, and will precipitate gold from a very weak solution of auro potassic cyanide; but it is objectionable by reason of the large amount of Prussian blue formed and the number of lead plates required.

Finally, the Pelatan-Clerici process is electrical, using one liquid and two metal electrodes. The objection to it is that it keeps in use too much mercury, although, on the other hand, practically no mercury is lost.

Alfred James, Glasgow, Scotland: Prof. Christy lays all cyanide workers under a heavy obligation by the publication of his exceedingly able paper. This record of results of careful and painstaking work and conclusions deduced from theoretical considerations are of the utmost value to the practical operator, and inspire the hope that Prof. Christy will also publish a similar paper on the mechanical side of the question.

His present paper differs from the majority of previous publications on the cyanide process in that the work therein referred to was based on considerations of theory, rather than of practice. One therefore naturally expects that results so obtained will not invariably agree with deductions from practice. Thus, the experimental use of chemically pure cyanide of potassium would lead workers in this direction, as it originally led MacArthur, to design cumbrous though ingenious plants for the admission of oxygen to the working solutions, when, as Prof. Christy himself shows, for ordinary ores the solutions carry more than enough oxygen for all practical purposes.

It is assumed that in writing of the effect of oxidizing agents the author is referring to experiments with metallic gold and not with auriferous ores, as otherwise the weight of experience appears to be entirely against his conclusions that "each of these * * * when added to a potassium-cyanide solution increased the solubility of the gold over that shown in a similar solution without such addition." The use of oxidizers has not been found beneficial in practice, except in special cases, such as those in which soluble sulphides are present; in which case, as suggested by Ellis, the oxidizers decompose the sulphides, the retarding action of which he first noticed in 1889. Even in this case it was necessary to select carefully the oxidizer employed.

Perhaps the most brilliant portion of the paper is that relating to cyanogen bromide, in which the author shows that even theoretically oxygen is not necessary for the solution of gold by potassium cyanide, and affirms the important truth that nascent cyanogen is the real factor.

The first generally known record of the proposed application of cyanogen bromide, chloride or iodide to the extraction of gold is that contained in the patent specification of Dr. Gaze of New Zealand, who applied for a patent for the use of this re-agent in 1892; but the knowledge of its real function as a most convenient means for producing nascent cyanogen is apparently of comparatively recent date; indeed, Prof. Christy seems to have been the earliest recorded discoverer.

Some time since an investigation on the subject showed that BrCy was not at all the unstable compound, when mixed with alkalies or alkaline carbonates, that Watts had declared it to be, and that even considerable quantities of caustic alkali or carbonate failed to decompose the compound, whereas, when it was added to a solution of KCy, decomposition commenced immediately.

It was also found that BrCy made by sublimation and BrCy made by the addition of bromine water to a solution of potassium cyanide behaved alike. The text book reaction, $KCy - 2Br = KBr + BrCy$, therefore appears to be correct, though with dilute solutions the reaction takes considerable time for completion.

The gradual but complete decomposition of BrCy in presence of KCy with formation of Cy_2 led to the attempt to substitute gaseous CN in solution, with results which showed a distinct improvement with metallic gold over the extraction by KCy alone; but in every case the *nascent* cyanogen proved itself superior.

A point which the author has apparently overlooked is that the decomposition of BrCy in KCy solution, instead of being immediate, is usually very gradual, extending over some hours; the rate depending, among other things, on the purity of the cyanide employed and the amount of alkali present, as it is found that while alkali *per se* does not decompose the BrCy, it generally accelerates decomposition when KCy is present. A knowledge of this important fact facilitates the addition of BrCy in small quantities from time to time, as required. On the other hand, the tendency to the formation of paracyanogen, even in very dilute solutions, was very great, and the catalytic action rapidly increased on exposure. This probably accounts for the failure in practice to obtain good results with this re-agent.

The section of the paper on the precipitation of gold from cyanide solutions abounds in interesting points; but for the present the writer wishes to confine his remarks to Prof. Christy's observations on precipitation by means of metallic zinc. At the outset, exception must be taken to some of the objections raised by the author against this process.

Objection 1 is well founded and is admitted.

Objection 2 does not appear to be well founded, either upon Prof. Christy's theoretical considerations or upon actual results in practice with *dilute* solutions. In the whole of the paper there is not a single reaction shown in which free cyanide is consumed by zinc, with the exception of the hypothetical reaction given hereafter, and the whole tenor of the previous results on auropotassic cyanide solutions shows that such free cyanide of potassium is entirely unnecessary to the reaction. In every other case it is shown that the zinc merely replaces the gold in the auropotassic cyanide, and this could scarcely be termed a "great destruction of free potassium cyanide."

Moreover, a series of determinations, taken from various plants in different parts of the world, has shown that with weak solutions, as used in practice, there is no appreciable loss of cyanide in the zinc boxes. The difference in tests taken from the head and tail of the boxes is seldom perceptible, and any difference, when found, is at least as frequently in favor of the tails as against it. (These tests are, of course, not conclusive, and a rapid correct method of determining actual free cyanide in the presence of double cyanide of zinc and potassium and caustic potash is greatly needed.) In this connection it may be noted that even if the whole of the $KAuCy_2$ present in the extractors were regenerated by the action of the nascent hydrogen and in the presence of caustic potash, the increase in the test would be only about .001 per cent—so slight is the amount.

On the other hand, the assertion that "the great consumption of zinc" is due to free potassium cyanide is untenable in face of the fact that *more cyanide* would be required for this one reaction than is at present *consumed* for the *whole treatment*—that of the ore included. The average consumption of zinc is 0.3 pound per ton treated, and this alone would therefore account for a consumption of cyanide of 1.2 pound per ton. But tailings are being regularly treated in Africa, with an even greater consumption of zinc than that shown, for an actual consumption of only 0.45 pound of cyanide per ton for the whole process.

Objection 3, as to the removal of the zinc and cyanogen residues, is partly met by the usual practice of running water through the boxes immediately prior to cleaning up, and allowing "slimes" to flow through a sieve of fine mesh. Bullion 950 fine and over has been regularly produced by this method; and when zinc is not conveniently thus separated, an acid treatment is given.

Objection 4 is met by the results of Prof. Christy himself, when he shows that perfect precipitation has been obtained even from solutions of auropotassic cyanide *containing no free cyanide*. He objects to the time taken to effect this precipitation. This might have been lessened by increasing the amount of zinc-shavings; yet it is only about the same as that taken by the electrolytic process. It is also deemed impracticable because 1200 times the theoretical amount of zinc required was present. A rough calculation shows that in all ordinary works, with easily treated solutions, each box holds about 50,000 times more zinc than is theoretically necessary for the amount of gold in the box at any one time; but one merely runs the solution through continuously until the zinc has completed its function and is replaced by fresh zinc, there being practically no precipitation limit, as with charcoal. It would appear, therefore, that with such results before him, Prof. Christy goes out of his way to assume the necessity of the presence of free cyanide of potassium.

Recent investigations go to prove that effective precipitation is to a considerable extent a question of time of contact; that solutions from which free KCy is absent require longer contact; and that this may be due to the fact that a zinc-gold couple is more energetic in KCy solutions than in solutions of KHO or $KAuCy_2$. This would also explain the greater difficulty of *starting the precipitation* when using very dilute or KCy-free solutions; whereas, when once the zinc-gold couple is formed, the action proceeds satisfactorily. In practice this difficulty is seldom encountered except when starting a new plant, and may be easily overcome by adding a little free KCy to the boxes at the outset.

Prof. Christy objects to certain equations suggested by the writer, on the ground that they bring one back to the point one wished to avoid, and, secondly, that they "fail to explain the increase of free alkali which everyone recognizes as taking place in the zinc boxes." To deal with the latter point first: In some zinc-box experiments recently carried out by the writer, the amount of alkali present was carefully determined before and after the contact with zinc, with the following results:

	Before. Per cent.	*After. Per cent.*
(*a*) Two-day test, samples taken every twelve hours—		
Alkalinity (by litmus)	0.13	0.11
Alkalinity (by phenolpthalein) less the difference from litmus test	0.01	0.006
(*b*) Two-day test, as above—		
Alkalinity (litmus)	0.22	0 21
Alkalinity (phenol.)	0.016	0.014
Three-day test—		
Alkalinity (litmus)	0.168	0 16
Alkalinity (phenol.)	0.12	0.019
Six day test—		
Alkalinity (litmus)	0.168	0.15
Alkalinity (phenol.)	0.011	0.01

This solution contained practically no free cyanide of potassium, but double cyanide of zinc and potassium was present to the extent of 0.76 per cent. Prof. Christy might give some figures in support of his contention as to increased alkalinity, as the above solution or its results may be abnormal.

As to the equations given by the writer bringing one back to $2KAuCy_2 + Zn = 2Au + ZnK_2Cy_4$, Prof. Christy even thus fails to show any consumption of *free potassium cyanide*, which was the point the writer started to avoid; but Prof. Christy only arrives at this point by making

$$(c)\ 2KC + 2HCy + K_2ZnO_2 = ZnK_2Cy_4 + 2KHO$$

into a universal reaction instead of a limited one "to a certain extent," as suggested by the writer, it being obvious that in the presence of free KHO, expressly stated to be present, the following reaction would occur:

$$HCy + KHO = KCy + H_2O$$

with regeneration of the KCy, as stated.

In conclusion, one cannot but express the hope that Prof. Christy may be induced to favor the Institute with a further account of his valuable research on this subject.

(*Later Communication.*)—Since sending the above remarks to the secretary, I have discovered, by means of experiments involving the crystallizing out of the product from saturated aqueous solutions, that zincate of potash, in the presence of excess of cyanide of potassium, may form double cyanide of zinc and potassium, as stated by Prof. Christy. It does not, however, follow that the cyanogen is thereby rendered ineffective for gold extraction, as Prof. Christy would infer. On the contrary, double cyanide of zinc and potassium, in the presence of caustic potash, has a very decided action on gold; and, in fact, the behavior of this substance in other ways is so similar to that of free cyanide that it is practically impossible to estimate either of these substances correctly in the presence of the other. The reaction is apparently similar to that occurring with simple cyanide.

$$K_2ZnCy_4 + 2Au + 2KHO + O = 2KAuCy_2 + K_2ZnO_2 + H_2O.$$

(*To be Continued.*)

* Discussion at the Chicago meeting of the Am. Inst. Min. Eng., Feb., '97, of the papers of Prof. S. B. Christy, H. Van F. Furman and G. A. Packard.

Some Mines of Butte, Montana.

Butte, Montana, is undoubtedly the liveliest mining camp in existence—though to call such a rich, solidly built city a camp is, in this instance, a misnomer. In previous issues have been given views and descriptions of different smelters and Montana silver mines, and in this issue are illustrated, on page 333, some additional bullion producers famous in mining annals and especially interesting to all residents of Montana.

UPPER WORKS AT ANACONDA.

The upper and lower works at Anaconda show a part of an immense business, which from nothing in 1881 has grown to an output of 140,000,000 pounds of copper in 1896, worth $15,000,000. Thousands of men are employed. A full description, including detailed technical account of the processes, has appeared herein.

BROADWAY, BUTTE, MONTANA, LOOKING EAST FROM LIBRARY TOWER, ANACONDA MINE IN THE DISTANCE.

The Anaconda mine is located on the apex of a hill formed by Town gulch and the panhandle of the valley, and is about 600 feet higher than Butte. It was originally bought as a silver mine by Marcus Daly for Eastern capitalists. This mine is developed to a depth of 1700 feet by a three-compartment shaft. They use a double-balance hoist with flat rope reels. It requires a battery of fourteen pairs of boilers to supply them with power for pumping and hoisting. The mine is equipped throughout with the latest appliances for economic mining, such as power drills, compressor plant, electric signals, etc. The vein at this point is so wide—over 125 feet—that even the forest of timber which they have put into the mine has not been sufficient to support the walls. The hill shows on the surface great cracks marking the course of the workings below. Their principal ores are chalcopyrite, bornite, tetrohedrite and argentiferous chalcocite. The latter occurs in huge masses of remarkable purity. Manganese and zinc are both absent in section.

In the immediate neighborhood of the Anaconda are several big mines deserving of mention. One of these, the Never Sweat, lies townward from the Anaconda, and is developed to the 1300-foot level. They have just completed installing a mammoth hoist capable of lifting two four-decked cages, capacity one ton each, 2500 feet. By this they will be able to double their former daily output of 1200 tons. The St. Lawrence, another of this group, has a daily output of 1000 tons, while the High Ore, Mt. Consolidated, Wake Up Jim and Green Mountain will each average 600 tons per day. It requires a train of 108 cars—each forty tons capacity—to carry the Anaconda's daily output to their smelters at Anaconda, twenty-nine miles distant.

The Lexington mine is one of a group comprising the Alice, Bozeman, Goldsmith and others, illustrated in a previous issue. All are developed to depths varying from one thousand to fifteen hundred feet. Their surface ores were mainly chlorides, carbonates and a considerable amount of free gold. Together with these, there was a great amount of manganese spar. As depth was reached, the chlorides and carbonates passed into sulphides, while, remarkable as it may seem, the manganese still remained as rhodochrosite. Only in one mine of this series was copper found—the 800-foot level of the Lexington. This is being prospected at the present time, in hopes that it will prove to be a cross vein from the middle zone. Nearly all of these mines have stamp and chlorination mills working on their ores. To the Lexington Company belongs the distinction of producing the first silver ore successfully milled in Butte, nearly thirty years ago.

The Gagnon mine is another pioneer. This mine is in the western part of the middle area. Its ores carry golenite, spholerite, enargite, silver sulphide, a very rich silver-copper-zinc blende, pyrites and chalcopyrite. The dip of the vein in the Gagnon is greater than in any other mine of this belt, and theirs is the only inclined shaft in Butte. They use a skip, and are working at a depth of 1200 to 1400 feet. It was either upon the Gagnon or upon the adjoining claim that the first mineral discovery in Butte was made over forty years ago. That was merely a scratch upon the surface; now the mine is opened 1500 feet deep. The Gagnon is the principal producer for the Colorado Smelting and Mining Co., though the company owns several other mines. It was the rich placers at Silver Bow, Rocker, Town, Buffalo and Missoula creeks that first attracted prospectors to the vicinity of Butte. Silver Bow is a small settlement six miles west of Butte, and is situated in the gap through which Silver Bow creek flows. Rocker lies half way between the city and Silver Bow, and is the extreme west of the producing area. Missoula gulch is on the outskirts of the town. Town and Buffalo creeks are within the city limits. It was noted that Rocker and Town gulch gold differed greatly in purity; the former being rated at "20" fine on a scale of 24, while the latter but "13." This was due to the large amount of silver alloyed with the Town gulch product. Systematic prospecting resulted in discovering several rich prospects, among them the Old Original and the Acquisition, both producers at the present time. In 1879, the struggling camp organized as the Summit Valley mining district, and by rapid strides soon became the greatest mining camp in existence. The main range to the east of the city is composed of a coarsely granular, dark, boric granite. The Butte slope, in which are all the older mines, is of the same formation, but here it has been greatly disintegrated by the vapors and other phenomena attendant upon the eruption of the "big butte." This cone is an island of rhyolite sending off arms into the sea of granite surrounding it. It bears a singular physical relation to the granites, in that a line passed through it divides the darker granite on the east from the extremely acid granite on the west. This lighter granite, locally called the Burlington, from one of the mines within its area, extends about two miles west to the low foothills at Silver Bow. The eruption of this butte bears a very important relation to the ore deposits of the district.

The veins occur in three parallel zones extending in a northeasterly direction, and, strictly speaking, are not true fissures, as they seldom show a well-defined wall. Up to 1894 this caused considerable trouble in obtaining patents from the Government, as the Montana code required the prospector to show at least one well-defined wall. Since then the code has been changed. He is now required to expose the lode to a depth of 10 feet.

Emmons accounts for the above state of affairs by saying: "The veins of Butte are fissured zones extending east and west, produced by a common dynamic movement, shattering the whole region. From their relation they seem to point to the explosive eruption of the 'butte' as their source. They are clearly not the result of a single great fault, which would tend to leave parallel walls, with crushed debris between, and accompanying slickensides on one or the other of its walls, but were originally cracks only sufficiently wide to admit mineral solutions."

This view is further strengthened by what is seen in the veins in the outlying district. In two localities adjacent to the fissured district the veins show both walls, and, moreover, are filled with angular fragments of country rock and vein material intermingled. This is the case in the Park canyon mines to the east of Butte, and in several properties north of Walkerville, which is situated one and one-half miles east and one-half mile north of the conical butte.

The hot vapors accompanying this disturbance aided the mineral solutions in altering and dissolving the wall rock, thus increasing the space within which they deposited their minerals. Thus is the great width of the Butte veins accounted for. Throughout the camp they are from 1 to 60 feet in width, their "walls" being merely commercial limits, dependent upon facilities for extraction and treatment. In the Anaconda they are frequently 125 feet wide, while in the far western section—in the Germania, Little Darling, Blue Bird and Orphan Boy—they are seldom wider than 8 feet.

Exploring and Exploiting a Gold Country.

If the mining men now in the Yukon country are wise, they will cease looking for phenomenally rich streaks in small placers, and will search for the original quartz veins from which these placers have been made. The gold of the Klondike and Stewart river countries is coarse, indicating a short journey from its original source. It was to have been expected that some important discoveries of lodes would be made before now, but it seems that all attention has been paid to the placers. As to these finds in river beds, they have very likely been equalled by those in Boise basin, in California gulch and in many other places, the difference mainly being in the coarseness of the Yukon gold. This coarseness seems to have put a queer idea into the illustrators of *Puck*, which for two weeks printed pictures of supposed gold pans with gratings in their bottoms, the scheme evidently being, to the artist's mind, to screen out the small gravel and mud, retaining only the big nuggets.

But we must not look disdainfully on the gold pan. It, or some similar appliance for testing by washing, is the only available means for estimating the value of gravel, which of course it would be absurd to assay. Although its work looks so rough, in reality, in experienced hands, it gives wonderfully accurate results, so that it is not only used with gravel, but is by many considered far better than the fire-assay for gold-bearing quartz, when the ore is pounded up, screened and washed in it. Formerly it was used wholly for getting gold; now it is used for testing and for cleaning up small lots of particularly rich stuff. It is the implement with which the future exploration of the Alaska gold fields will be effected.

Theoretically, everyone knows by this time the art of exploring and exploiting a gold country. It has been so well acquired that a handful of men can overrun a wide territory in a few days, and locate all the placer-ground worth taking up. The idea, for quartz, is simply to follow up the gulches and canyons wherever the pan shows the color; to stop when the indications cease or lessen; and then to skirmish in the side or end hills for a lode. All of which looks easy on paper. In practice, however, if one is prospecting in a "mineral" region, colors are found everywhere. Then it is necessary to use the pan, not as a mere means of finding gold, but as a means of estimating how much—that is, it becomes an assay, though closer than any assay.

After experimenting with the horn spoon, saucers, Riotte spoon, the batea, pointed tumblers, and all sorts of appliances, it is my opinion that there is nothing to compare with the old, original, California 20-inch gold pan, stamped out of one piece of sheet iron, with an angle of, say, 30° and no crease in the bend. With this tool, and a five-minute instruction, but with considerable experience, one can rapidly reach a rough estimate of the value per ton in gravel or pounded rock. This is something which the fire-assay cannot do for the prospector.

It is a great convenience to have two gold pans or else one pan and a bucket, so as to save time. In this way the rough work can be done rapidly, the small stuff containing the gold being thrown together into the other receptacle, the prospector keeping in his mind a tally of the number of pans. A heaped pan-load weighs about twenty pounds, so that one pan represents the hundredth part of a short ton. It is easy to acquire the habit of picking up uniform pan-loads. With gravel, the amount of the pan-load depends somewhat on the size of the stuff, all moderate-sized pebbles being washed and allowance being made for boulders, which requires judgment. In testing pounded quartz, the most convenient weight is ten pounds, or the two-hundredth of a ton. A larger weight of gravel can be used—fifteen to twenty pounds. The knack of gauging the quantity is easily acquired, all that is necessary being to determine on some convenient aliquot part of the ton or cubic yard, the latter ranging between one and one-half and one and three-quarter tons, so that a pan will stand for the 100th, 150th, 200th, or other fraction, with allowance for boulders. When using two pans, after taking enough samples, all the small lots of concentrates in the second pan are together washed carefully over the first pan, the overflow tailings rewashed, and the aggregate result carefully cleaned by drying, removing black sand by a magnet and winnowing off the rest of the waste. When the amount of gold collected is considerable, it is weighed in the most delicate balance available. Estimating "colors" is a different matter, as a small fraction of a cent makes a showing to mislead the novice. With a little practice and advice from an old hand, this art also is mastered.

It is by means of this sort that the Yukon country will be prospected and developed. At present it is going through the stages that early California went through. The rocker, the tom, and the short sluice are there. Hydraulicking and booming have, so far, been conducted on a small scale, and, as the open season is so short and the gravel so shallow, this kind of mining cannot last long. The future is in the quartz.

Perhaps the best way to "size up" a "rush" is to remember what has happened in others. About once in three years an excitement of this kind occurs in the mining community. That it extends now to the outside public is due to greater newspaper advertising.

It has always happened that, after a great mining excitement and its accompanying speculative fever, there has been a sharp reaction, often a crash and a temporary set-back, with a slow recovery. Afterwards a district that has been over-boomed, and then underrated, settles down to its normal level in the opinion of investors, and work goes on less feverishly and more successfully. Some of the mining corporations which will be engaged in really exploiting the new Yukon mines will doubtless pass through the same experience. As for the catchpenny schemes, the sooner they are exploded the better for Alaska. But there is little doubt of their being real and substantial merit somewhere in all that vast new area, or areas, so that it is possible there may be worthy rivals of the great Treadwell, so far Alaska's single heavy gold producer.

If there are such mines in the far north, it will require extraordinary effort to get in machinery and supplies, and to put them in shape for active production. Little, comparatively speaking, is needed to outfit a small placer—sometimes only the crudest appliances, such as some lumber whipsawed or turned out by a small sawmill on the spot, supplemented by a nozzle or two and a few hundred feet of canvas pipe. But to equip a big hydraulic mine, supposing there to be warrant in the ground for putting in an extensive plant, involves heavy expense for transporting the miles of large steel or iron piping and other metal fixtures required.

Supposing that the prospecting for the quartz lodes, from which the placers already discovered were derived, should reveal something in the nature of a big mine or mines, it is not a necessary sequence from the richness of the gravel that the veins should be small and high-grade ones, for which moderate plants would suffice, involving even in this case freight charges amounting to several times the cost of the machinery at the foundry. The famous gold quartz mines of the world have been and are of moderate down to very low-grade ore. In fact, the most productive have been of extremely low grade, but having large deposits. So, judging from analogy, if really great quartz mines are to be found and properly developed in the new regions, we shall see some achievements in rapid equipment and overcoming of disadvantages which will almost put the celebrated work on the Homestake (Black Hills) mine to the blush. In the last mentioned case a railroad—engine, rails and all—was hauled in by wagon teams hundreds of miles from the nearest railroad. A modern plant for a big gold mine is something to look at with respect, with its heavy hoisting, haulage and pumping equipment, its huge mills containing hundreds of stamps and its constant heavy renewals and supplies. Low-grade mines have to be worked on a very large scale to render a profit. So, if there are to be new Homestakes or Treadwells up the Yukon, there will be some nice engineering that is not mining.

It is a great pity that, no matter how successful the new districts turn out to be, provided they are successful at all, the public will have lost interest, and the newspapers will not devote space to describing the most interesting part of the work. Next season it will be an old story. But, if the work this fall, winter and spring reveals a small fraction of what the shouters promise, there will be some hustling in Alaska, though the general public will hear little of it.—Albert Williams, Jr., in Engineering Magazine.

Noise is Distracting.

Some one has said that the love of noise was nothing but a savage instinct; that the people who are not sensitive to noise are not sensitive to anything else—thought, argument, poetry, art or any kind of intellectual influence. The reason given is that the tissue of their brains is of a very rough and coarse quality, while on the other hand noise is a torture to intellectual people.

Schopenhauer explains the aversion to noise as follows: "If you cut up a diamond into little bits, it will entirely lose the value it had as a whole; and an army divided up into small bodies of soldiers loses all its strength. So a great intellect sinks to the level of an ordinary one as soon as it is interrupted and disturbed. Its attention is distracted and drawn off from the matter in hand, for its superiority depends upon its power of concentration. Noise is the most impertinent of all forms of interruption, and is a hindrance to this concentration; it is not only that, but a disruption of thought. That is why distinguished minds have always shown such a dislike to violent noises that break in upon and distract their thoughts. Ordinary people are not inconvenienced much by anything of the sort."

A MELBOURNE DISPATCH says the expedition of the Sydney Geographical Society under Professor David to the Ellice islands, northeast of Australia, has obtained evidence confirming the theory of Darwin as to the formation of coral islands. Diamond drilling in coral to the depth of 557 feet failed to reach bottom.

Production of Lead in 1896.*

By CHARLES KIRCHHOFF.

In spite of the fact that the year 1896 was one of general industrial depression, reflected in the case of lead by a sharp contraction of the consumption, the output of the metal from American sources showed so marked an increase that the record of 1891 was passed. In that year the quantity of lead produced from ores mined in the United States was 178,554 short tons. In 1896 it reached 180,000 short tons. Even that quantity did not cover the requirements of the country, in a year of depression, by 20,000 short tons. In years of normal consumption our requirements lie between 240,000 and 250,000 short tons.
